Common characteristics of bauxite are a pisolitic structure and a mottled appearance. This is particularly true of lateritic bauxite. The pisolites may be pea-size and cemented or potato-size and loose. The colour of the mass often varies from cream and grey to pink and yellowish or dark red. In the *terra rossa* bauxite the texture is frequently granular and impervious, unless a pisolitic structure exists. The exposed surface of lateritic bauxite is rough, often scoriaceous, simulating vesicular lava. In cliff sections lateritic bauxite may have a vermicular structure with variegated colours.

A common property of vermicular lateritic bauxite, which is soft when freshly excavated, is its tendency to harden on exposure. Another peculiarity of lateritic bauxite is the readiness with which its débris re-consolidates. Recognizable minerals are rarely seen in hand-specimens of bauxite. Gibbsite is commonly distinguished in thin slices under the microscope, especially in the matrix of pisolitic bauxite. The specific gravity is variable, from 2.45 to 3.25. The hardness also differs, some bauxites being soft and clay-like, others hard and tough. There is no reliable test for ascertaining the quality of bauxite short of a chemical analysis.

Typical lateritic bauxites average the following composition: Silica 0.25 to 10%, titania 1 to 10%, alumina 50 to 65%, ferric oxide 0.25 to 15% and combined water 20 to 33%. This is true of material from Arkansas, British Guiana, the Gold Coast and India. Terra rossa bauxites are slightly different. Silica 0.25 to 15%, titania 1.25 to 4%, alumina 56 to 75%, ferric oxide 0.5 to 25% and combined water from 8 to 15%. Such is the material from France, the Adriatic seaboard and the Balkans.

Appreciable percentages of titania characterize Indian bauxites formed from the Deccan basaltic lavas. The oxides of manganese, chromium, zirconium and vanadium have been noted in certain bauxites. Cobalt, nickel, tin, gold and diamonds have been found in others. The smaller percentage of combined water in the *terra rossa* bauxite is usually characteristic. Neither type of bauxite, when heated, gives up its combined water steadily—large emissions occur about 260°C. and 670°C. with complete dehydration near 950°C. The silica in bauxite is usually combined with alumina and should not exceed 10% in ore intended for aluminium reduction. In European practice this limit is about 3% and in America 5 to 6%. All the alumina in bauxite is not soluble in hydrochloric acid. Bauxite with over 50% soluble alumina constitutes fair aluminium ore. Material with more than 4% ferric oxide is not attractive to alum manufacturers.

The mode of formation of lateritic bauxite is the same as laterite (*see LATERITE*). The current opinion is that laterite represents the residual weathering product of rocks containing aluminium and iron silicates. W. A. K. Christie and C. S. Fox (1923) consider that Indian bauxites are indicative of the operation of capillary pressures, dialysis and electrolytic migration

during laterite formation. To electrokinetic phenomena are largely ascribed the removal of the silica and the separation of the colloidal aluminium hydroxides from those of ferric iron in the decomposed rock. Terra rossa bauxites are presumed to have the same genesis as terra rossa.

The world's annual production of bauxite exceeds one million tons. Over 60% of this output is used for the extraction of aluminium. Another 15% of the production is absorbed in the chemical industry, primarily for the preparation of aluminium hydroxide, but also for making sodium aluminate, aluminium chloride, aluminium sulphate and alum. The remainder of the bauxite output (about 15%) is used for the production of abrasives (emery) and refractories; in the manufacture of alumina (fused) cements; and for kerosene purification. (C. S. F.)

Bauxite in the United States.—The manufacture of bauxite elements is becoming an important industry. It was first located by Edward Nichols in 1883 in north-western Georgia. This ore of aluminium is claylike in appearance, some of it being soft and friable and some of it hard and brittle, ranging in colour from white and pink into brown and deep red.

Bauxite is generally formed through the weathering of certain igneous and sedimentary rocks, such as granite, syenite, basalt, limestone and clay. The term "bauxite" is applied to a mixture of hydrates of aluminium with impurities. The monohydrate of aluminium is called diaspor. The tri-hydrate is called gibbsite. Chemically pure diaspor and gibbsite are seldom found in nature and the term "bauxite" is applied to the impure varieties of these minerals, as well as to the mixtures of the two.

Generally speaking the bauxites of North and South America are tri-hydrates with varying amounts of silica, iron oxide and titanium oxide as the chief impurities; while the European ores, for the most part, are mixtures of mono-hydrates and tri-hydrates, also with silica, iron oxide and titanium oxide as the chief impurities. Typical American bauxite will analyze approximately 60% aluminium oxide, called alumina, 5% silica, 3% iron oxide, 3% titanium oxide and 29% chemically combined water. The free moisture in the ores as mined is generally driven off by heating in kilns before marketing.

Bauxite occurs in most countries of the world, with a tendency towards tropical or semi-tropical districts. The mines of southern France and those of southern United States have been longest in operation and have produced the largest amounts of bauxite, although very extensive mining operations have been carried on in British and Dutch Guiana, in western Hungary and in Istria, Dalmatia and other Adriatic countries, where immense deposits of bauxite are found. Large deposits are known to exist also in central and western Africa, Australia, Rumania, India, Greece and Brazil, as well as in many other countries. The known deposits are of sufficient magnitude to supply the world's requirements for a very long period of time. Moreover, new discoveries are being reported at frequent intervals.

Aluminium was a rare and expensive metal, obtained from cryolite, until economical methods for its extraction from bauxite were discovered. In the year 1886 Charles M. Hall, of Oberlin, O., while a student at Oberlin college, discovered an electrolytic process for extracting aluminium from alumina. Bauxite being the most readily available source of alumina, this material became recognized as the natural raw material for the metal aluminium. In the year 1889 patents were issued to Charles M. Hall covering his invention, and about this same time M. Paul Heroult of France invented a similar process, which has formed the basis of European development in aluminium manufacture.

Metallic aluminium is made from bauxite by first removing the impurities from the latter, thus producing alumina, which in turn is treated in an electrolytic bath which separates the metal from the oxygen. Four or five tons of bauxite are required to produce one ton of metallic aluminium.

The abrasive industry uses large quantities of bauxite, which in the process of manufacture is fused in specially designed electric furnaces. Considerable quantities of bauxite are also used for making quick-hardening cement, in the refractory industry, in manufacturing aluminium chloride used in petroleum refining, and

for making aluminium sulphate, which is largely used in paper making and water purification. (W. C. N.)

BAVAI, town of north France, department of Nord, 15m. E.S.E. of Valenciennes. Pop. (1926) 1,544. It has been a focus of important roads since early times. The capital of the Nervii, it was known to the Romans as Bagacum or Bavacum, and was the meeting place of eight of their roads. It was destroyed in the 5th century and has suffered much in later wars. It was the British advanced headquarters in 1914 but was taken later, and recaptured in Nov. 1918.

BAVARIA (Freistaat Bayern), the largest republic of Germany in area and population, next to Prussia. It consists of two distinct and unequal portions, Bavaria proper, and the Palatinate of the Rhine, which lie from 25 to 40m. apart and are separated by the republics of Baden and Hesse. Bavaria proper is bounded on the south by the Alps, on the north-east, over against Czechoslovakia, by the Böhmerwald; on the north by the Fichtelgebirge and the Frankenwald, and on the west by Württemberg and Baden. Except for the valley of the Main in the north-west, nearly all the surface is over 1,000ft., the ranges seldom exceed 3,000ft.; but the ridges in the south, towards Tirol, frequently attain 9,000 or 10,000 feet. The country mainly belongs to the basin of the Danube, which, entering from Suabia as a navigable stream, traverses the republic with a winding course of 200m., receiving the Iller, Lech, Isar and Inn from the south, and the Altmühl and Naab from the north. The Inn is navigable before it enters Bavarian territory, and afterwards receives the Salzach, a large river flowing from Upper Austria. The Main follows a winding course among the broken hills of Upper and Lower Franconia, and greatly facilitates the trade of the provinces. The district watered by the southern tributaries of the Danube consists for the most part of the sub-Alpine plateau, with a mean elevation of 2,390 feet. The smaller or western portion, the Palatinate, is bounded on the east by the Rhine, which divides it from Baden; on the south by Alsace, and on the west and north by the Haardtgebirge, which separate it from Lorraine and the Prussian Rhine province.

Area and Population.—Bavaria proper contains an area of 27,210 sq.m., and the Palatinate or western (without the Saar district) 2,124 sq.m., making a total of 29,334 sq.m. Pop. (1925), 7,379,594. In 1925, 52% of the population were living in towns, etc., with 2,000 inhabitants and over. The towns with over 50,000 inhabitants (1925) are: Munich (680,704); Nürnberg (392,494); Augsburg (165,522); Ludwigshafen (101,869); Würzburg (89,910); Regensburg (76,948); Furth (73,693); Kaiserslautern (59,336) and Bamberg (50,152). Politically the country is divided into eight provinces, as follows.

Province	Capital	Pop. of province in 1925	Area in sq. m.
Upper Bavaria . . .	Munich	1,684,766	6,437
Lower Bavaria . . .	Landshut	755,769	4,148
Upper Palatinate . . .	Regensburg	629,262	3,725
Upper Franconia (including Coburg) . . .	Bayreuth	757,515	2,808
Middle Franconia . . .	Ansbach	998,386	2,935
Lower Franconia . . .	Würzburg	762,744	3,260
Suabia	Augsburg	859,397	3,807
The Palatinate (excluding the Saar district) . . .	Speyer	931,755	2,124
Total		7,379,594	29,334

Religion.—The majority of the inhabitants (about 70%) are Roman Catholics. Protestants number over 2,000,000. The districts of Lower Bavaria, Upper Bavaria, and the Upper Palatinate are almost wholly Roman Catholic, while in the Rhine Palatinate, Upper Franconia, and especially Middle Franconia, Protestants predominate. Of the Roman Catholic Church the heads are the two archbishops of Munich and Bamberg, and the six suffragan bishops of Eichstätt, Speyer, Würzburg, Augsburg, Regensburg and Passau. The Protestant Church is under a superior church council, with three general deaneries for Bavaria proper and one general church council for the Palatinate. The

republic has two Roman Catholic universities, Munich and Würzburg, and a Lutheran, Erlangen; Munich has a famous technical high school and academies of sciences and of art. It is famous as a centre of culture.

Agriculture.—Of the total area, nearly one-half is under cultivation, one-third forest, and the remaining sixth mostly pasture. The level country of Lower Bavaria and parts of Franconia are productive of rye, oats, wheat, barley and vines. The last are grown chiefly in the vicinity of the Lake of Constance on the banks of the lower Main, and in the Palatinate. Hops are extensively grown in central Franconia; tobacco (the best in Germany) is raised round Nürnberg and in the Palatinate, which also produces sugar-beet. Potatoes are cultivated especially in the Palatinate and in the Spessart district, which lies within a curve of the Main. The southern divisions of Suabia and Upper Bavaria, where pastureland predominates, form a cattle-breeding district and the dairy produce is extensive. The extensive forests are principally situated in the provinces of Upper Bavaria, Lower Bavaria and the Palatinate; they have played an important part in moulding the life of these areas.

Minerals.—The chief mineral deposits in Bavaria are coal, iron ore, graphite, lignite, lead ore and salt. The coal mines lie principally in the districts of Amberg, Kissingen, Steben, Munich and the Palatinate. Salt is obtained partly from brine springs and partly from mines, the principal centres being Halle, Berchtesgaden, Traunstein and Rosenheim. The ancient Government monopoly was abolished in 1867. There are numerous quarries of excellent marble, basalts, granite, alabaster and gypsum; and the porcelain-clay is among the finest in Europe. There are also numerous mineral springs, many of which have long been resorted to for their curative properties.

Manufactures and Trade.—A great stimulus to Bavarian industry was given by the law of 1868, which abolished the remains of the old restrictions of the guilds, and gave the whole country the liberty which had been enjoyed by the Rhine Palatinate alone. The chief centres of industry are Munich, Nürnberg, Augsburg, Fürth, Erlangen, Aschaffenburg, Regensburg, Würzburg, Bayreuth, Ansbach, Bamberg and Hof in Bavaria proper; and, in the Palatinate, Speyer and the Rhine port of Ludwigshafen. The main centres of the hardware industry are Munich, Nürnberg, Augsburg and Fürth; the first two especially for locomotives and automobiles, the last for tinfoil and metal toys. Aschaffenburg manufactures fancy goods, Augsburg and Hof produce cloth, and Munich has a great reputation for scientific instruments. In Franconia are numerous paper-mills, and the manufacture of wooden toys is carried on in the forest districts of Upper Bavaria. The breweries of Munich, Nürnberg, Erlangen and Kulmbach are famous. Other articles of manufacture are leather, tobacco, porcelain, cement, spirits, lead pencils (Nürnberg), glass, sugar, matches, aniline dyes, straw hats and baskets. The exports consist chiefly of corn, potatoes, hops, beer, wine, cloth, cotton goods, glass, fancy wares, toys, cattle, pigs and vegetables. The seat of the hop-trade is Nürnberg; of wool, Augsburg. The imports comprise sugar, tobacco, cocoa, coffee, oils, silk and pig iron.

There are steamboat services on the navigable rivers to the east by way of Passau on the Danube, and to the west by Ludwigshafen. The Ludwigskanal connects the Rhine with the Danube, extending from Bamberg on the Regnitz to Dietfurt on the Altmühl. In 1921 work was begun on the Rhine-Main-Danube waterway; and the portion as far as Aschaffenburg was opened to through traffic in 1924. It was expected that the completion of the works for the transit of ships of 1,500 tons would take 12 years. The kingdom of Bavaria, incorporated with the German empire in 1871, was declared a republic on Nov. 28, 1918. Its constitution is dated Aug. 14, 1919. The supreme power lies with the people. Religious associations have equal rights and are free in all their activities. The diet consists of one chamber, elected for four years and having (in 1928) 129 members, each representing about 62,000 inhabitants. On March 11, 1920, the Free State of Coburg was united by a bill with the republic of Bavaria, the inhabitants of Coburg having unanimously decided in favour of union in 1919.

HISTORY

The earliest known inhabitants of the district afterwards called Bavaria were a people, probably Celtic, who were subdued by the Romans just before the opening of the Christian era, their land being included in the province of Rætia. The cities of Augsburg, Regensburg, and Passau were originally Roman colonies. During the 5th century it was ravaged by the troops of Odoacer and, after being almost depopulated, was occupied by tribes who, pushing along the valley of the Danube, settled there between A.D. 488 and 520. They were, like the Franks, composed of a mixture of Teutonic tribes, and were known as *Bawarii* or *Bainuvarii*, words derived most probably from *Baya* and given to them because they came from *Baya-Hemum* or *Bohemia*. They are first mentioned in a Frankish document of 520. Their country was bounded by the Enns, the Danube, the Lech, and the Alps.

The Bavarians soon came under the dominion of the Franks, and were ruled from 555 to 788 by dukes of the Agilolfing family, possibly of Frankish descent. For a century and a half these dukes resisted the inroads of the Slavs, and by the time of Duke Theodo I. (d. 717) were independent of the feeble Frankish kings. When Charles Martel became the virtual ruler of the Frankish realm he brought the Bavarians into strict dependence, and Pippin the Short was equally successful in maintaining his authority.

Christianity was introduced into Bavaria by Rupert, bishop of Worms, who came at the invitation of Duke Theodo I. in 696. He founded several monasteries, and a similar work was also performed by St. Emmeran, bishop of Poitiers. The 8th century witnessed indeed a heathen reaction; but it was checked by the arrival in Bavaria about 734 of St. Boniface, who organized the Bavarian church and founded or restored bishoprics at Salzburg, Freising, Regensburg, and Passau.

Union with Carolingian Empire.—Tassilo III, who became duke of the Bavarians in 749, recognized the supremacy of the Frankish king, Pippin the Short, in 757, but soon showed signs of insubordination, and, during the early years of the reign of Charlemagne, acted as an independent ruler. His position as possessor of the Alpine passes, as an ally of the Avars, and as son-in-law of the Lombard king Desiderius, was so serious a menace to the Frankish kingdom that Charlemagne determined to crush him. The details of this contest are obscure. The outcome, however, was that Tassilo had to surrender his duchy in 794. The country was ruled by Gerold, a brother-in-law of Charlemagne, till his death in a battle with the Avars in 799, when its administration was entrusted to Frankish counts and assimilated with that of the rest of the Carolingian empire.

When the empire was partitioned in 817, Bavaria was assigned to Louis the German, king of the East Franks, and thus formed part of the larger territories which were confirmed to him in 843 by the treaty of Verdun. Louis made Regensburg his capital and was active in improving the condition of Bavaria. When he divided his possessions in 865 it passed to his eldest son Carloman, and after his death in 880 formed part of the territories of the emperor Charles the Fat. Its defence was left by this incompetent emperor to Arnulf, an illegitimate son of Carloman, and it was mainly owing to the support of the Bavarians that Arnulf was able to take the field against Charles in 887, and to secure his own election as German king. Bavaria, which was the centre of the East Frankish kingdom, passed in 899 to Louis the Child, during whose reign it was constantly ravaged and all but depopulated by the Hungarians. For the defence of Bavaria the mark of Carinthia had been erected on the south-eastern frontier, which during the reign of Louis the Child was ruled by Liutpold, count of Scheyern, who fell in the disastrous defeat of the Bavarians by the Hungarians on July 5, 907. His son Arnulf I., surnamed the Bad, rallied the remnants of the race, drove back the Hungarians, and was chosen duke of the Bavarians in 911, when Bavaria and Carinthia were united under his rule. Refusing to acknowledge the supremacy of the German king Conrad I, he was unsuccessfully attacked by the latter, and in 920 was recognized as duke by Conrad's successor, Henry I, the Fowler, who admitted his right to appoint the bishops, coin money, and issue laws. A similar conflict took place between Arnulf's son Eber-

hard and Otto the Great; but Eberhard was less successful than his father, for in 938 he was driven from Bavaria, which was given by Otto, with reduced privileges, to the duke's uncle, Bertold. When Bertold died in 947 Otto conferred the duchy upon his own brother Henry, who had married Judith, a daughter of Duke Arnulf; Henry's short reign was spent mainly in disputes with his people. The ravages of the Hungarians ceased after their defeat by the emperor Otto on the Lechfeld in 955. In that year Henry I. was succeeded by his young son Henry, surnamed the Quarrelsome, who in 974 was implicated in a rising against King Otto II. The revolt was soon suppressed; and in 976 Henry was formally deposed, Bavaria being given to Otto, duke of Swabia. At the same time Carinthia was made into a separate duchy. Restored in 985, Duke Henry II. proved himself a capable ruler by establishing internal order, issuing important laws and reforming the monasteries. His son, who was chosen German king as Henry II. in 1002, gave Bavaria to his brother-in-law, Henry of Luxemburg, after whose death in 1026 it passed successively to Henry, afterwards the emperor Henry III., and to another member of the family of Luxemburg, as Duke Henry VII. In 1061 the empress Agnes, mother of and regent for the German king Henry IV., entrusted the duchy to Otto of Nordheim, who was deposed by the king in 1070, when the duchy was granted to his son-in-law Count Welf, son of Azzo II., of Este. In consequence of his support of Pope Gregory VII., in his quarrel with Henry, Welf lost but subsequently regained Bavaria; and was followed successively by his sons, Welf II. in 1101, and Henry IX. in 1120. Henry was succeeded in 1126 by his son Henry X., the Proud, who obtained the duchy of Saxony in 1137. King Conrad III., however, refused to allow two duchies to remain in the same hands, declared Henry deposed, and bestowed Bavaria upon Leopold IV., margrave of Austria. When Leopold died in 1141 the king retained the duchy himself; but it continued to be the scene of considerable disorder, and in 1143 he entrusted it to Henry II., surnamed Jasomirgott, margrave of Austria. The struggle for its possession continued until 1156, when King Frederick I. persuaded Henry to give up Bavaria to Henry the Lion, a son of Duke Henry the Proud.

Rule of the Wittelsbachs.—A new era set in when in 1180 Henry was placed under the imperial ban, and the duchy was given by Frederick I. to Otto, a member of the old Bavarian family of Wittelsbach (*q.v.*), and a descendant of the counts of Scheycern. After the destruction of the Carolingian empire the borders of Bavaria were continually changing and for a long period after 955 this process was one of expansion. To the west the Lech still divided Bavaria from Swabia, but on three other sides the duchy had been extended and embraced a large area north of the Danube. During the later years of the rule of the Welfs, however, the extent of Bavaria had been reduced. The energies of Duke Henry the Lion had been devoted to his northern rather than his southern duchy, and when the dispute over the Bavarian succession was settled in 1156 the district between the Enns and the Inn had been transferred to Austria. The increasing importance of the mark of Styria, erected into a duchy in 1180, and the county of Tirol, had diminished the strength of Bavaria, which now had few opportunities for expansion.

When Otto of Wittelsbach was invested with Bavaria in Sept. 1180 the duchy was bounded by the Böhmerwald, the Inn, the Alps, and the Lech; and the power of the duke was practically confined to his extensive private domains around Wittelsbach, Kelheim, and Straubing. Otto was succeeded in 1183 by his son Louis I., who took a leading part in German affairs during the earlier years of the reign of the emperor Frederick II., and was assassinated at Kelheim in Sept. 1231. His son Otto II., called the Illustrious, increased the area of his lands by purchases; and he had strengthened his hold upon the duchy before he died in Nov. 1253. The efforts of the dukes to consolidate their power over the duchy had been fairly successful; but they were soon vitiated by partitions among different members of the family, which for 250 years made the history of Bavaria little more than a chronicle of territorial divisions, family feuds and petty squabbings.

Division of the Duchy.—The first of these divisions was made in 1255 between Louis II. and Henry I., the sons of Duke Otto II., Louis obtaining the western part of the duchy, afterwards called Upper Bavaria, and Henry the eastern, or Lower Bavaria. In the course of a long reign Louis, "the Stern," became the most powerful prince in southern Germany. He was the uncle and guardian of Conradin of Hohenstaufen, and when this prince was put to death in Italy in 1268, Louis and his brother Henry inherited the domains of the Hohenstaufen in Swabia and elsewhere. He helped Rudolph of Habsburg to secure the German throne in 1273, married the new king's daughter Mechtild, and aided him in his campaigns. For some years after the death of Louis in 1294 his sons Rudolph I. and Louis, afterwards the emperor Louis IV., ruled their duchy in common; but in 1310 a division of Upper Bavaria was made, by which Rudolph received the land east of the Isar, with the town of Munich, and Louis the district between the Isar and the Lech. This arrangement, however, soon led to war between the brothers, and in 1317, three years after he had been chosen German king, Louis compelled Rudolph to abdicate, and for 12 years ruled alone over the whole of Upper Bavaria. But in 1329 a series of events induced him to conclude the treaty of Pavia with Rudolph's sons, Rudolph and Rupert, to whom he transferred the Palatinate of the Rhine, which had been in the possession of the Wittelsbach family since 1214, and also a portion of Upper Bavaria north of the Danube which was afterwards called the Upper Palatinate. At the same time it was decided that the electoral vote should be exercised by the two lines alternately, and that in the event of either branch of the family becoming extinct the surviving branch should inherit its possessions.

When in 1290 Henry I. of Lower Bavaria died, the duchy was ruled by his three sons, Otto III., Louis III. and Stephen I. Louis died childless in 1296; Stephen left two sons at his death in 1310, namely, Henry II. and Otto IV., and Otto, who was king of Hungary from 1305 to 1308, died in 1312, leaving a son, Henry III. Lower Bavaria was ruled by these three princes until 1333, when Henry III. died, followed in 1334 by his cousin Otto; and as both died without sons the whole of Lower Bavaria passed to Henry II. Dying in 1339, Henry left an only son, John I., who died childless in the following year, when the emperor Louis IV. secured Lower Bavaria and united the whole duchy under his sway. The union of Bavaria under Louis lasted seven years, with much benefit to the country. When he died in 1347 he left six sons to share his possessions, who agreed upon a division of Bavaria in 1349. Its history, however, was complicated by its connection with Brandenburg, Holland, and Tirol, all of which had also been left by the emperor to his sons. All six brothers exercised some authority in Bavaria; but three alone left issue, and of these the eldest, Louis, margrave of Brandenburg, died in 1361, his only son Meinhard dying two years later without issue. The two remaining brothers, Stephen II. and Albert I., ruled over Bavaria-Landshut and Bavaria-Straubing respectively, and when Stephen died in 1375 his portion of Bavaria was ruled jointly by his three sons. In 1392, when all the lines except those of Stephen and Albert had died out, an important partition took place, by which the greater part of the duchy was divided among Stephen's three sons, Stephen III., Frederick, and John II., who founded respectively the lines of Ingolstadt, Landshut, and Munich. Albert's duchy of Bavaria-Straubing passed on his death in 1404 to his son William II., and in 1417 to his younger son John, who resigned the bishopric of Liège on becoming duke. When John died in 1425 this family became extinct, and after a contest between various claimants Bavaria-Straubing was divided between the three remaining branches of the family.

The main result of the threefold division of 1392 was the temporary eclipse of Bavaria. Neighbouring states encroached upon its borders and the nobles ignored the authority of the dukes, who for 50 years were mainly occupied with intestine strife. This condition of affairs, however, was not wholly harmful. The government of the country and the control of the finances passed mainly into the hands of an assembly called the *Landtag* or *Land-schaft*, organized in 1392. The towns, assuming a certain inde-

pendence, became strong and wealthy as trade increased, and the citizens of Munich and Regensburg were often formidable antagonists to the dukes. Thus a period of disorder saw the growth of representative institutions and of a strong civic spirit. The rule of Stephen III., duke of Bavaria-Ingolstadt, was marked by struggles with various towns and with his brother, John of Bavaria-Munich. Dying in 1413, he was followed by his son Louis, called the Bearded, a restless and quarrelsome prince, who had played an important part in the affairs of France, where his sister Isabella was the queen of King Charles VI. About 1417 he became involved in a violent quarrel with his cousin, Henry of Bavaria-Landshut, fell under both the papal and the imperial ban, and in 1439 was attacked by his son Louis the Lamé. This prince, who had married a daughter of Frederick I. of Hohenzollern, margrave of Brandenburg, was incensed at the favour shown by his father to an illegitimate son. Aided by Albert Achilles, afterwards margrave of Brandenburg, he took the elder Louis prisoner and compelled him to abdicate in 1443. When Louis the Lamé died in 1445 his father came into the power of his enemy, Henry of Bavaria-Landshut, and died in prison in 1447. The duchy of Bavaria-Ingolstadt passed to Henry, who had succeeded his father Frederick as duke of Bavaria-Landshut in 1393, and whose long reign was almost entirely occupied with family feuds. He died in July 1450, and was followed by his son, Louis IX., "the Rich," and about this time Bavaria began to recover some of its former importance. Louis IX. expelled the Jews from his duchy, took some steps for the security of traders, and improved both the administration of justice and the condition of the finances. In 1472 he founded the university of Ingolstadt, and he made an attempt to reform the monasteries. On his death in 1479 he was succeeded by his son George, also called the Rich, who died without sons in Dec. 1503, whereupon a war broke out for the possession of his duchy.

Bavaria-Munich passed, on the death of John II in 1397, to his sons Ernest and William III., but they only obtained possession after a struggle with Stephen of Bavaria-Ingolstadt. Both brothers were then engaged in warfare with the other branches of the family and with the citizens of Munich. William, a loyal servant of the emperor Sigismund, died in 1435, leaving an only son, Adolf, who died five years later, and Ernest died in 1438. In 1440 the whole of Bavaria-Munich came to Ernest's son Albert, whose attempts to reform the monasteries earned for him the surname of Pious. He died in 1460, leaving five sons, the two elder of whom, John IV. and Sigismund, reigned in common until the death of John in 1463. The third brother, Albert, who had been educated for the church, joined his brother in 1465, and when Sigismund abdicated two years later became sole ruler, in spite of the claims of his two younger brothers.

Reunion of the Duchy.—In 1504, Albert IV., called the Wise, became involved in the war which broke out for the possession of Bavaria-Landshut on the death of George the Rich. Albert's rival was George's son-in-law, Rupert, formerly bishop of Freising and son of Philip, count palatine of the Rhine; and the emperor Maximilian I., interested as archduke of Austria and count of Tirol, interfered in the dispute. Rupert died in 1504, and in 1505 an arrangement was made at the diet of Cologne by which the emperor and Philip's grandson, Otto Henry, obtained certain outlying districts, while Albert, by securing the bulk of George's possessions, united Bavaria under his rule. In 1506 Albert decreed that the duchy should pass undivided according to the rules of primogeniture. He was partially successful in improving the condition of the country; and in 1500 Bavaria formed one of the six circles into which Germany was divided for the maintenance of peace. He died in March 1508, and was succeeded by his son, William IV., whose mother, Kunigunde, was a daughter of the emperor Frederick III. In spite of the decree of 1506 William was compelled, in 1516, to grant a share in the government to his brother Louis, an arrangement which lasted until the death of Louis in 1545.

William followed the traditional Wittelsbach policy, opposition to the Habsburgs, until in 1534 he made a treaty at Linz with Ferdinand, king of Hungary and Bohemia. This was strengthened

in 1546, when the emperor Charles V. obtained the help of the duke during the war of the league of Schmalkalden by promising him the reversion of the Bohemian throne, and the electoral dignity enjoyed by the count palatine of the Rhine. William also did much at a critical period to secure Bavaria for catholicism. The reformed doctrines made great progress in the duchy; but the duke, who had sympathized with Luther's first protests, objected to doctrinal innovations, and while obtaining from the pope powers to reform the morals of the clergy, took measures to repress the reformers. In 1542, at his invitation, Loyola sent some brethren of the new Society of Jesus to Bavaria, and later the university of Ingolstadt became the headquarters of the society in Germany. William, whose death occurred in March 1550, was succeeded by his son Albert V., who had married a daughter of Ferdinand of Habsburg, afterwards the emperor Ferdinand I. Early in his reign, Albert made some concessions to the reformers, who were still strong in Bavaria; but about 1563 he changed his attitude, favoured the decrees of the council of Trent, and pressed forward the work of the counter-reformation. As education passed into the hands of the Jesuits, protestantism was effectually crushed in Bavaria. Albert V. was a great patron of art. His court at Munich was the resort of artists of all kinds, and the city was enriched with splendid buildings. The expenses of a magnificent court led the duke to quarrel with the Landschaft, to oppress his subjects, and to leave a great burden of debt when he died in Oct. 1579. The succeeding duke was Albert's son, William V (called the Pious) who was a devout pupil of the Jesuits. He secured the archbishopric of Cologne for his brother Ernest in 1583, and this dignity remained in the possession of the family for nearly 200 years. In 1597 he abdicated in favour of his son Maximilian I., and retired into a monastery, where he died in 1626. Maximilian found the duchy encumbered with debt and filled with disorder, but ten years of his vigorous rule effected a remarkable change. The finances and the judicial system were reorganized, a class of civil servants and a national militia founded, and several small districts were brought under the duke's authority. The result was a unity and order in the duchy which enabled Maximilian to play an important part in the Thirty Years' War; during the earlier years of which he was so successful as to acquire the Upper Palatinate and the electoral dignity which had been enjoyed since 1356 by the elder branch of the Wittelsbach family. In spite of subsequent reverses these gains were retained by Maximilian at the peace of Westphalia in 1648. During the later years of this war Bavaria suffered severely. In 1632 it was invaded by the Swedes and, when Maximilian violated the treaty of Ulm in 1647, was ravaged by the French and the Swedes. After repairing this damage to some extent, the elector died at Ingolstadt in Sept. 1651, leaving his duchy much stronger than he had found it. The recovery of the Upper Palatinate made Bavaria compact; the acquisition of the electoral vote made it influential; and the duchy was able to play a part in European politics which intestine strife had rendered impossible for the past 400 years.

Beginning of Modern Period.—For the next two centuries Bavaria was to suffer for the dynastic ambitions of her rulers. Maximilian's son, Ferdinand Maria (1651–79), did much to repair the wounds caused by the Thirty Years' War, encouraging agriculture, industries, and building, and recalling in 1660 the diet, which had been suspended since 1612. But his son, Maximilian II. Emmanuel (1679–1726), went to war with the Turks, and joined France in the war of the Spanish succession. He shared in the defeat at Höchstädt on Aug. 13, 1704, and his dominions were partitioned between Austria and the elector palatine, and only restored to him, harried and exhausted, at the Peace of Baden in 1714. His son, Charles Albert (1726–45), seized the opportunity of the death of the emperor Charles VI to dispute the validity of the Pragmatic Sanction which secured the Habsburg succession to Maria Theresa, allied himself with France, conquered Upper Austria, was crowned king of Bohemia at Prague and, in 1742, emperor at Frankfurt. The price he had to pay, however, was the occupation of Bavaria itself by Austrian troops. The invasion of Bohemia in 1744 by Frederick II. of Prussia enabled him to return to Munich, and at his death on Jan. 20, 1745, his successor,

by the Peace of Füssen (April 22, 1745) obtained the restitution of his dominions in return for a formal acknowledgment of the Pragmatic Sanction. The reign of Maximilian III. Joseph (1745-77) was peaceful and prosperous.

War of Bavarian Succession.—At his death the Bavarian line of the Wittelsbachs became extinct, and the succession passed to Charles Theodore, the elector palatine. After a separation of four and a half centuries, the Palatinate, to which the duchies of Jülich and Berg had been added, was thus reunited with Bavaria. Joseph II., emperor of Austria, took this opportunity to put forward a claim to about a third of Bavaria, and sent troops across the frontier, with the secret consent of Charles Theodore who, having no legitimate heirs, hoped, in return, for the elevation of his natural children to the status of princes of the empire. The protests of the next heir, Charles, duke of Zweibrücken, supported by Frederick the Great of Prussia, led to the war of the Bavarian succession, and by the Peace of Teschen (May 13, 1779) the Inn quarter was ceded to Austria, and the succession secured to Charles of Zweibrücken. Meanwhile Charles Theodore abandoned the enlightened internal policy of his predecessor, the Government was inspired by the narrowest clericalism and on the eve of the revolution the intellectual and social condition of Bavaria remained that of the middle ages.

The Revolutionary Wars.—In 1792 the revolutionary armies overran the Palatinate; in 1795 the French, under Moreau, invaded Bavaria itself, advanced to Munich—where they were received with joy by the long-suppressed Liberals—and laid siege to Ingolstadt. Charles Theodore fled to Saxony, leaving a regency to sign a convention with Moreau, who granted an armistice in return for a heavy contribution (Sept. 7, 1796). Immediately afterwards he was forced to retire. Between the French and the Austrians, Bavaria was now in an evil case. Before the death of Charles Theodore (Feb. 16, 1799) the Austrians had again occupied the country, preparatory to renewing the war with France. Maximilian IV. Joseph, the new elector, succeeded to a difficult inheritance. Though his own sympathies, and those of his minister, Max Josef von Montgelas (*q.v.*), were French rather than Austrian, the state of the Bavarian finances and the disorganization of the troops placed him helpless in the hands of Austria. On Dec. 2, 1800, Bavaria shared in the Austrian defeat at Hohenlinden, and Moreau once more occupied Munich. By the Treaty of Lunéville (Feb. 9, 1801) Bavaria lost the Palatinate and the duchies of Zweibrücken and Jülich.

The influence of Montgelas now gave Bavarian policy a new direction. On Aug. 24 a separate treaty of peace and alliance with France was signed at Paris by which compensation was promised at the expense of Austria, for the territory on the left bank of the Rhine ceded at the Treaty of Lunéville. Accordingly, in the territorial rearrangements of 1803, Bavaria received the bishoprics of Würzburg, Bamberg, Augsburg and Freisingen, part of that of Passau, the territories of 12 abbeys, and 17 cities, the whole forming a compact territory. Pursuing the policy of alliance with France, Bavarian troops fought side by side with the French in the Ulm-Austerlitz campaign of 1805 and by the Treaty of Pressburg, Dec. 20, the principality of Eichstädt, the margraviate of Burgau and the lordship of Vorarlberg, and other territories were to be added to Bavaria. On the other hand Würzburg, obtained in 1803, was to be ceded by Bavaria to the elector of Salzburg in exchange for Tirol; the treaty also acknowledged the assumption by the elector of the title of king, as Maximilian I. The price which Maximilian had reluctantly to pay for this accession of dignity was the marriage of his daughter Augusta with Eugène Beauharnais.

For the internal constitution of Bavaria also the French alliance had noteworthy consequences. Maximilian and Montgelas belonged to the 18th-century school of "enlightened" princes and politicians. But the revolutionary changes introduced by the constitution proclaimed on May 1, 1808, were due to the direct influence of Napoleon. A clean sweep was made of the mediaeval polity surviving in the somnolent local diets and corporations. In place of the old system of privileges and exemptions were set equality before the law, universal liability to taxation, abolition

of serfdom, security of person and property, liberty of conscience and of the Press. A representative assembly was created on paper but never summoned.

In 1809 Bavaria was again engaged in war with Austria on the side of France, and by the treaty signed at Schönbrunn on Oct. 15, 1809, ceded southern Tirol to Italy and some small districts to Württemberg, receiving as compensation parts of Salzburg, the quarters of the Inn and Hausruck and the principalities of Bayreuth and Regensburg. So far the policy of Montgelas had been brilliantly successful; but the star of Napoleon had now reached its zenith; already the astute opportunist had noted the signs of the coming change and on Oct. 8 was signed the Treaty of Ried, by which Bavaria threw in her lot with the Allies.

Tirol and Vorarlberg reverted to Austria at the first Peace of Paris (1814), but at the Congress of Vienna it was decided that Bavaria was to add to these the greater part of Salzburg and the quarters of the Inn and Hausruck, receiving as compensation Würzburg, Aschaffenburg and other territories. But with the collapse of France the old fear and jealousy of Austria had revived in full force, and war was only averted by the authority of the Grand Alliance. At the Congress of Aix (1818) and by the Treaty of Frankfurt, July 20, 1819, the territorial questions at issue between Bavaria and Austria were settled, in spite of the protests of the former, in the general sense of the arrangement made at Vienna.

Constitution of 1818.—Meanwhile on Feb. 1, 1817, Montgelas had been dismissed, and a new era of constitutional reform begun. In the new German confederation Bavaria had assumed the rôle of defender of the smaller States against the ambitions of Austria and Prussia, and to obtain popular support for this policy the crown prince pressed for a liberal constitution, the reluctance of Montgelas to concede it being the cause of his dismissal. On May 26, 1818, the constitution was proclaimed. The parliament was to consist of two houses; the first comprising the great hereditary landowners, government officials and nominees of the Crown; the second, elected on a very narrow franchise, representatives of the small landowners, the towns and the peasants. Religious equality and the rights of Protestants were guaranteed, concessions which were denounced at Rome as a breach of the recently concluded Concordat. The parliament was hardly opened (Feb. 5, 1819) before the doctrinaire radicalism of some of its members so alarmed the king, that he appealed to Austria and Germany, undertaking to carry out any repressive measures they might recommend, but the parliament, chastened by the consciousness that its life depended on the good will of the king, moderated its tone; and Maximilian ruled till his death as a model constitutional monarch.

Ludwig I.—On Oct. 13, 1825, he was succeeded by his son, Ludwig I., the earlier years of whose reign were marked by a liberal spirit and by financial reform; but the revolutions of 1831 and the opposition of the parliament to his expenditure on building and works of art frightened him into reaction. In 1837 the Ultramontanes came into power with Karl von Abel (1788-1859) as prime minister. The Jesuits now gained the upper hand; the Protestants were harried and oppressed; and a rigorous censorship forbade any free discussion of internal politics. The collapse of this régime was brought about by the king's infatuation for an Irish adventuress, Lola Montez. Ultramontanes and radicals, equally incensed at the influence she exercised, joined in riotous demonstrations in 1847. Neither the Protestant Georg Ludwig von Maurer (*q.v.*), who had succeeded Abel as minister, nor his successor, Prince Ludwig von Oettingen-Wallerstein, the head of the cabinet nicknamed the "Lolaministerium," was able to restore order; and on March 20, 1848, unable to deal effectually with the crisis caused by the Paris Revolution the king abdicated in favour of his son, Maximilian II.

Anti-Prussian Policy.—The new sovereign was a zealous supporter of the national effort to achieve German freedom and unity, accepting the authority of the central Government at Frankfurt, and (Dec. 19) sanctioning the official promulgation of the laws passed by the German parliament. But Prussia was henceforth the enemy, not Austria. In refusing to agree to the

offer of the imperial crown to Frederick William IV., Maximilian had the support of his parliament. In withholding his assent to the new German Constitution, by which Austria was excluded from the Confederation, he ran, indeed, counter to the sentiment of his people; but by this time the back of the revolution was broken, and in the events which led to the humiliation of Prussia at Olmütz in 1851, and the restoration of the old diet of the Confederation, Bavaria was safe in casting in her lot with Austria (see GERMANY: History). The guiding spirit in this anti-Prussian policy was Ludwig Karl Heinrich von der Pfordten (1811-80), who became minister for foreign affairs in April 1849, and who aimed at establishing a *Trias*, i.e., a league of the Rhenish States as a counterpoise to the preponderance of Austria and Prussia. His reactionary internal policy, less severe than elsewhere in Germany, led none the less from 1854 onward to a struggle with the parliament, which ended in the dismissal of Pfordten's ministry on March 27, 1859. He was succeeded by Karl Freiherr von Schrenk auf Notzing (1806-84), an official of Liberal tendencies who introduced important reforms including the separation of the judicial and executive powers and the drawing up of a new criminal code. In foreign affairs Schrenk followed his predecessor's policy.

Maximilian was succeeded on March 10, 1864, by his son, Ludwig II., a youth of 18. The Government was at first carried on by Schrenk and Pfordten in concert. Schrenk soon retired, when the Bavarian government found it necessary, in order to maintain its position in the Prussian *Zollverein*, to become a party to the Prussian commercial treaty with France, signed in 1862. In the complicated Schleswig-Holstein question (*q.v.*) Bavaria consistently opposed Prussia and finally, in the war of 1866, sided actively with Austria.

Union with the German Empire.—The rapid victory of the Prussians and the wise moderation of Bismarck paved the way for a complete revolution in Bavaria's relation to Prussia and the German question. The South German Confederation, contemplated by the Treaty of Prague, never came into being; and, though Prussia, in order not prematurely to excite the alarm of France, opposed the suggestion that the southern states should join the North German Confederation, an offensive and defensive alliance with Prussia was signed at Berlin on Aug. 22, 1866, as the result of Napoleon's demand for "compensation" in the Palatinate. The separatist ambitions of Bavaria were thus formally given up and, in the war of 1870-71, the Bavarian army marched against France under the command of the Prussian crown prince.

On Nov. 23, 1870, a treaty was signed between Bavaria and the North German Confederation, by which, though Bavaria became an integral part of the new German empire, she reserved a larger measure of sovereign independence than any of the other constituent states. Thus she retained a separate diplomatic service, military administration, and postal, telegraph and railway systems. The treaty was ratified by the Bavarian chambers on Jan. 21, 1871, in spite of the opposition of the "patriot" party. Their hostility was increased by the *Kulturkampf*, due to the promulgation in 1870 of the dogma of papal infallibility. Munich university, where Döllinger (*q.v.*) was professor, became the centre of the opposition to the new dogma, and the "old Catholics" (*q.v.*) were protected by the king and the government. The federal law expelling the Jesuits was proclaimed in Bavaria on Sept. 6, 1871, and was extended to the Redemptorists in 1873. On March 31, 1871, moreover, the bonds with the rest of the empire had been drawn closer by the acceptance of a number of laws of the North German Confederation, of which the most important was the new criminal code, which was finally put into force in Bavaria in 1879. The opposition of the "patriot" party, however, reinforced by the strong Catholic sentiment of the country, continued powerful, and the support given by the king to successive Liberal ministries alone prevented its finding disastrous expression in the parliament.

Regency of Prince Luitpold.—Meanwhile, Ludwig II. and his brother, Otto I., both having been declared insane, the heir presumptive, Prince Luitpold, was proclaimed regent on June 7, 1886: six days later Ludwig committed suicide. During Luitpold's

long rule Bavaria shared in the common prosperity of Germany: but it was long before she forgot her "particularism," founded on traditional racial and religious antagonism to Prussia.

Towards the end of Luitpold's regency the Catholic-Clerical Party came into power, after prolonged political struggles. On the defeat of the Podewil Ministry in the elections of Feb. 1912, Baron von Hertling, a leader of the Centre Party, formed a cabinet consisting mainly of officials. In December of the same year Luitpold died; on Nov. 5, 1913, his son Ludwig III., who had succeeded him as regent, was made king.

Revolution of 1918.—The World War brought a truce to party politics but in its later stages the discontent of the population gradually assumed alarming proportions. Von Dandl, who had succeeded von Hertling as minister-president, was confronted with the revolution, which broke out in Munich on the night of Nov. 7-8, 1918, before the fall of the Imperial Government in Berlin. The Wittelsbach dynasty was deposed, and Kurt Eisner, the Independent Socialist, placed himself at the head of the Revolutionary Government. Pending a re-election of the diet, a provisional constitution of the Socialist Republic of Bavaria was set up. The diet was to meet on Feb. 21, 1919, but on that very day Eisner was shot dead. The result was the outbreak, on April 4, of a new revolution, inspired by the Bolsheviks, which collapsed, after fierce fighting, on May 1. Once more the diet was assembled, and on May 5, 1919, Hoffmann, the minister-president, laid before it the Government's scheme for the new constitution.

The New Constitution.—The new constitution of Aug. 14, 1919, was based on the assumption that Bavaria was still a sovereign state, though, by the Weimar Constitution of Aug. 11, foreign policy, the army and railways had become the concern of the Reich. Bavaria's economic policy also became severely restricted, as the financial legislation of the Reich had requisitioned her principal sources of income. The form of the state was prescribed by the Reich; Bavaria became a democratic republic with parliamentary government, but without a president to act as a check on parliament. The diet has thus no superior authority except that of the people, which elects its members and can dissolve it by a "popular demand" (*Volksbegehren*), or administer the laws directly by a referendum (*Volksentscheidung*). The diet is elected, like the Reichstag, by universal suffrage and secret ballot, on the system of proportional representation. It consists of a single chamber. The minister-president appointed by the diet has not the standing of a prime minister. The responsibility for administration rests upon individual ministers who may be forced to resign by a vote of non-confidence. Direct legislation by the people, by popular vote, may occur (1) when the diet rejects a "popular demand" for the enactment of a law or accepts it only in an amended form, and (2) when the diet has passed a law from which, within two months, an appeal is made by "popular demand" or a referendum called for by the whole of the Ministry but with these exceptions, the constitution is based upon a system of representative democracy.

The policy of Bavaria after 1919 was governed by (1) the fear of a conflict with the Reich and (2) the risk of a counter-revolution by Nationalist and Monarchist organizations. The dominating parties in Bavaria held that the Weimar Constitution involved excessive centralization, and wished to return to the old Federal Constitution of the Reich. On the question of the particular rights to be retained by Bavaria there were constant battles between the two Governments.

The rise of the Nationalist organizations was due, on the one hand, to a reaction against Bolshevism and, on the other, to the execution of the Versailles Treaty by the Entente. The attempted counter-revolution in Berlin, the so-called "Kapp Putsch" (March 1920), many participants in which sought refuge in Bavaria, was the indirect cause of the fall of Hoffmann's Socialist Ministry and Kahr's bourgeois (non-Socialist) Cabinet took its place. On June 6 the bourgeois parties obtained a two-thirds majority in the elections, and the "law-and-order party" (*"Ordnungsblock"*) began its rule. Herr Escherich founded the *Einwohnerwehr* or "Orgesch" (Organization Escherich), a voluntary militia, for protection against possible repetitions of a Bolshevik revolution.

This organization was, however, dissolved by order of the Entente Commission, and Von Kahr resigned in consequence on Sept. 12, 1921. His successor, Count Lerchenfeld, had an equally good majority but was also obliged to go out of office in the following year on account of a conflict with the Reich Government (Oct. 27, 1922). Von Knilling's new Ministry leaned still more to the right and the Democrats left the Government. National feeling found its extreme expression in the views of the National Socialists, a militarist, nationalist and anti-semitic body, nominally democratic in tendency, but actually largely used by the rich to break strikes and attack Socialism. This body led by one Hitler, a good demagogue but no politician, wavered between Bavarian separatism and pan-Germanism in a bewildering fashion. It became dangerous in the autumn of 1923, when Ludendorff joined it and gave it the backing of the secret military leagues. But it aroused opposition in Bavaria by setting itself against a restoration of the Wittelsbach dynasty and against the Catholic Church. Herr von Kahr was appointed general state commissioner with full dictatorial powers.

On Nov. 8, 1923, the counter-revolution broke out in Munich. It was suppressed with bloodshed, the Reich defence force having remained loyal to the Constitution. Von Kahr's task was now at an end, and on Feb. 18, 1924, he retired. The elections for the diet gave no party a majority; a coalition Ministry was therefore once more formed, consisting of the Bavarian People's Party, the German Nationals and the Farmers' League (*Bauernbund*). Held, the leader of the Bavarian People's Party, placed himself at the head. This Ministry offered a firm front to the National Socialist Party and strove to reach a settlement with the Reich Government. In the anti-Socialist and Federal tendency of its policy, it nevertheless followed in the track of its predecessors. The Monarchist (Wittelsbach) movement remained very strong (see GERMANY: *History*).

BAVARIAN SUCCESSION, WAR OF (1778–79): see BAVARIA and POTATO WAR.

BAVENO, village, Piedmont, Italy, province of Novara 13m. N.N.W. of Arona by rail. A resort with fine valleys. Its red granite quarries supplied columns for Milan Cathedral, S. Paolo fuori le Mura at Rome, the Galleria Vittorio Emanuele at Milan, etc.

BAWBEE, the Scottish name for a half-penny or other small coin, and hence used of money generally. A writer in 1573, quoted in Tytler's *History of Scotland*, speaks of "a coin called a bawbee, . . . which is in value English one penny and a quarter." The most plausible conjecture is that the word is a corruption from the name of one Sillebawby, master of the mint from which the coin was first issued about 1541.

BAX, ARNOLD EDWARD TREVOR (1883–), English composer, born in London on Nov. 6, 1883, studied at the Royal Academy of Music under Frederick Corder for composition and Tobias Matthay for pianoforte. As a student his exceptional facility, alike in composition and as an executant, excited astonishment and was illustrated further by the tendency to excessive elaboration which distinguished his own earliest creative efforts and a tendency, it may be added which, though better controlled later, has never been entirely overcome. But as to the wealth and distinction of his ideas and the skill and resourcefulness displayed in their handling there was never any question and he has long taken a place among the most interesting and important of contemporary British composers. Especially

attractive is the romantic and mystical feeling pervading so much of his work, with which characteristic may be associated his strong affinity for Irish folklore and legend and other aspects of the Celtic spirit. With the exception of opera, practically every branch of composition is represented in Bax's extensive output. For the orchestra his more notable works include three characteristically imaginative symphonic poems "The Garden of Fand" (1916), "Tintagel" (1917) and "November Woods" (1917) together with a fine symphony (1921). Among a number of admirable chamber works may be mentioned two violin sonatas, a string quartet and a fine piano quintet. In the way of choral music a beautiful carol "Mater ora Filium" for double choir unaccompanied may be especially noted, while three ballets, numerous pianoforte pieces and songs are included also in a long list.

BAX, ERNEST BELFORT (1854–1926), English writer and economist, was born at Leamington on July 24, 1854, and educated privately. When a young man he escaped from the strict sabbatarian atmosphere of his home, and went to study music in Germany, where he became interested in the work of the German philosophers. He subsequently returned to England, and associated himself with the early history of the socialist movement. He helped William Morris, in 1883, to found the Socialist League, whose members seceded from the Democratic Federation (a league of London working men's radical clubs), and edited its organ, the *Commonweal*. He left the Socialist League when it became extreme, and joined the Social Democratic Federation, editing *Justice* for it. In 1894 he was called to the Bar, and in the same year wrote *Socialism, its growth and outcome*, in collaboration with Morris. He is, however, known rather for his philosophical and historical works than his writings on socialism. The socialist ideal, as Bax understood it, embraced a much wider field than the re-organization of the material side of life, and he believed that in time such a strong bond of sympathy would be created between nations that racial conflicts would no longer be possible. In 1882 he edited Kant's *Prolegomena* with biography and introduction. His philosophical works include: *Handbook to the History of Philosophy* (1884); *The Problem of Reality* (1893); *The Roots of Reality* (1907); *Problems of Men, Mind and Morals* (1912); *The Real, the Rational and the Alogical* (1920). On the historical side he has written on such varied subjects as Jean Marat, the French revolution, German society at the end of the middle ages, the Peasants' War, the Anabaptists. In 1918 he published a volume of reminiscences which are valuable as a picture of the period in which he lived. Bax died in London on Nov. 26, 1926.

BAXTER, ANDREW (1686–1750), Scottish metaphysician, born in Aberdeen and educated at King's college. From 1741–47 he lived as a tutor with Lord Blantyre and Mr. Hay at Utrecht, and made excursions in Flanders, France and Germany. Returning to Scotland, he lived at Whittingehame, near Edinburgh, till his death in 1750. His chief work, *An Inquiry into the Nature of the Human Soul* (the 1750 edition of which contains an answer to an attack in Maclaurin's *Account of Sir I. Newton's Philosophical Discoveries*, and a dedication to John Wilkes), examines the properties of matter. Since matter is characterized by inactivity, *vis inertiae*, all movement occurring in it must be caused by some immaterial force, namely, God. But in the case of the human body, movement is caused by a special immaterial force, the soul. The soul, being immaterial, is immortal, and possesses a consciousness independent of the body. The argument is supportable by the phenomena of dreams, which are due to direct spiritual influences. Baxter's work is an attack on Toland's *Letters to Serena* (1704), which argued that motion is essential to matter, and on Locke and Berkeley, but his criticism of Berkeley is based on the common misinterpretations (see BERKELEY). Sir Leslie Stephen speaks of him as a curious example of "the effects of an exploded metaphysics on a feeble though ingenious intellect."

Beside the *Inquiry*, Baxter wrote *Matho sive Cosmotheoria Puerilis*, a compendium of universal scientific knowledge (editions in English 1740, 1745 and 1765, and *Evidence of Reason in Proof of the Immortality of the Soul* (published posthumously from mss. by Dr. Duncan in 1779).

See life in Kippis's *Biographia Britannica*; McCosh's *Scottish Philosophy*.

BAXTER, RICHARD (1615-1691), English Puritan divine, called by Dean Stanley "the chief of English Protestant Schoolmen," was born at Rowton, in Shropshire, at the house of his maternal grandfather, in November (probably the 12th) 1615. Educated at the free school of Wroxeter and under Richard Wickstead, chaplain at Ludlow Castle, he went to London under the patronage of Sir Henry Herbert, master of the revels, to follow that course, but he soon went home to study divinity. After three months' schoolmastering for Owen at Wroxeter he read theology, and especially the schoolmen, with Francis Garbet, the local clergyman. About this time (1634) he met Joseph Symonds and Walter Cradock, two famous Nonconformists, whose fervour influenced him. In 1638 he was nominated to the mastership of the free grammar school, Dudley, being ordained and licensed by John Thornborough, bishop of Worcester. His success as a preacher was at first not great; but he was soon transferred to Bridgnorth where, as assistant to a Mr. Madstard, he established a reputation.

He remained there nearly two years, studying deeply the controversy relating to Nonconformity and the Church of England. He soon, on some points, especially of discipline, became alienated from the Church; and after the requirement of what is called "the *et cetera* oath," he rejected Episcopacy in its English form. He was, however, a moderate Nonconformist; and such he always continued to be. Classed as a Presbyterian, he had no exclusive attachment to Presbyterianism, and would have accepted a modified Episcopalianism. But all forms of Church government were regarded by him as indifferent. He was unanimously elected minister of Kidderminster in April 1641, when he was but 26 years of age.

His ministry lasted with interruptions about 19 years; he accomplished a work of reformation in Kidderminster and the neighbourhood, as notable as any upon record. Civilized behaviour succeeded to brutality of manners; and, whereas the religious had been but few, the irreligious became in their turn rare. He formed the ministers in the country round about him into an association for the better fulfilment of their duties, uniting them together irrespective of their differences as Presbyterians, Episcopalians and Independents. The spirit in which he acted may be judged of from his *The Reformed Pastor*. During the Civil War he was exposed to annoyance and danger at Kidderminster, and therefore removed for a time to Gloucester and afterwards (1643-45) settled in Coventry, where he preached regularly both to the garrison and the citizens. After the battle of Naseby he became chaplain to Colonel Whalley's regiment, and continued so till Feb. 1647. During these stormy years he wrote his *Aphorisms of Justification* (1649), which excited great controversy.

Baxter's connection with the parliamentary army was characteristic of him; he joined it that he might, if possible, counteract the sectaries, and maintain the cause of constitutional government against republican tendencies. He regretted that he had not accepted an offer of Cromwell to become chaplain to the Ironsides, being confident in his power of persuasion under the most difficult circumstances. His success in converting the soldiery to his views was not great, but he kept his consistency remarkably. By disputation and conference, as well as by preaching, he enforced his doctrines, both ecclesiastical and political, and shrank as little from urging what he conceived to be the truth upon the most powerful officers as from instructing the meanest followers of the camp. Cromwell disliked his loquacity and shunned his society; but Baxter having to preach before him after he had assumed the Protectorship chose for his topic the divisions of the Church, and in interviews not only opposed him about liberty of conscience, but spoke in favour of the monarchy. In 1647 at the home of Lady Rouse of Rouse-Lench, in much physical weakness, he wrote a great part of his famous work, *The Saints' Everlasting Rest* (1650). On his recovery he returned to Kidderminster, where he also became a prominent leader, his sensitive conscience leading him into conflict with almost all the contending parties. His conduct always did "credit to his conscientiousness rather than to his wisdom."

After the Restoration Baxter, who had helped to bring it about, settled in London. He preached there till the Act of Uniformity took effect in 1662, and was employed in seeking for such terms of comprehension as would have permitted the moderate dissenters with whom he acted to remain in the Church of England. In this hope he was disappointed. There was at that time on the part of the rulers of the Church no wish for comprehension, and their aim was to excuse the breach of faith which their rejection of all reasonable methods of concession involved. The chief good that resulted from the Savoy conference was the production of Baxter's *Reformed Liturgy*. He gained in the larger and more important circle of the metropolis the same vogue that he had gained in the country. The power of his preaching was universally felt, and his capacity for business placed him at the head of his party. He had been made a king's chaplain, and was offered the bishopric of Hereford, but he could not accept the offer without sacrifice of principle. After his refusal he was not allowed to be a curate in Kidderminster, though he was willing to serve unpaid. Bishop Morley prohibited him from preaching. Baxter, however, found much consolation in his marriage on Sept. 24, 1662, with Margaret Charlton, a woman like-minded with himself. She died in 1681.

From the ejection of 1662 to the indulgence of 1687, Baxter's life was disturbed by persecution of one kind or another. He retired to Acton in Middlesex, for quiet study, and was dragged thence to prison for keeping a conventicle. The *mittimus* was pronounced illegal and Baxter procured a *habeas corpus*. He was taken up for preaching in London after the licences granted in 1672 were recalled by the king. The meeting-house which he had built for himself in Oxenden Street was closed after he had preached there but once. He was, in 1680, seized in his house, and conveyed away at the risk of his life, and though he was released that he might die at home, his books and goods were distrained. He was, in 1684, carried three times to the sessions house, being scarcely able to stand, and made to enter into a bond of £400 for his good behaviour.

But his worst encounter was with the chief justice, Sir George Jeffreys, in May 1685. He had been committed to the king's bench prison on the ridiculous charge of libelling the Church in his *Paraphrase on the New Testament*, and was tried before Jeffreys on this accusation. The trial is well known as among the most brutal perversions of justice which have occurred in England, though it must be remembered that no authoritative report of the trial exists. (See JEFFREYS, SIR GEORGE.) Baxter was sentenced to pay 500 marks, to lie in prison till the money was paid, and to be bound over for seven years. It was even asserted at the time that Jeffreys proposed he should be whipped at the cart's tail through London. The old man, for he was now 70, remained in prison for 18 months, when the Government, vainly hoping to win him to their side, remitted the fine and released him.

The long time of oppression from 1662 with bodily affliction, was the period of his greatest activity as a writer. He was a most voluminous author, his separate works, it is said, amounting to 168. They are as learned as they are elaborate and varied in their subjects. Such treatises as the *Christian Directory*, the *Methodus Theologiae Christianae*, and the *Catholic Theology*, might each have occupied the principal part of the life of an ordinary man. His *Breviate of the Life of Mrs. Margaret Baxter* records the virtues of his wife, and reveals his tenderness of heart.

The remainder of Baxter's life, from 1687 onwards, was passed in peace and honour. He preached and wrote almost to the end. He was surrounded by attached friends, and revered by the religious world. His saintly behaviour, his great talents, and his wide influence, added to his extended age, raised him to a position of unequalled reputation. He helped to bring about the downfall of James II. and complied with the Toleration Act under William and Mary. He died in London on Dec. 8, 1691, and his funeral was attended by churchmen as well as dissenters. A similar tribute of general esteem was paid to him nearly two centuries later, when a statue was erected to his memory at Kidderminster in July 1875.

Baxter was possessed by an unconquerable belief in the power of persuasive argument. He thought everyone was amenable to reason—bishops and levellers included. He was at once a man of fixed belief and large appreciation, so that his dogmatism and his liberality sometimes came into collision. His popularity as a preacher was pre-eminent; but he was a real student and in an age when it was the fashion even with the learned to deride the schoolmen he honoured the *Summa* of St. Thomas Aquinas. He was well equipped for intellectual debate, but his devotional tendency was as strong as his logical aptitude. Some of his writings from their metaphysical subtlety, will always puzzle the learned; but he could write to the level of the common heart without loss of dignity or pointedness. His *Reasons for the Christian Religion* is better than most work of its kind. His *Poor Man's Family Book* is a manual that continues to be worthy of its title. His *Saints' Everlasting Rest* will always command the grateful admiration of pious readers. It is also charged with a robust and manly eloquence and a rare and unsought felicity of language that make it a masterpiece of style. Perhaps no thinker has exerted so great an influence upon Nonconformity as Baxter has done, and that not in one direction only, but in every form of development, doctrinal, ecclesiastical and practical. He is the type of a distinct class of the Christian ministry—that class which aspires after scholarly training, prefers a broad to a sectarian theology, and adheres to rational methods of religious investigation and appeal. He hated fanaticism. Even Quakerism he could scarcely endure. Religion was with him all and in all—that by which all besides was measured, and to whose interests all else was subordinated. Isaac Barrow said that "his practical writings were never minded, and his controversial ones seldom confuted," and John Wilkins, bishop of Chester, asserted that "if he had lived in the primitive time he had been one of the fathers of the Church."

BIBLIOGRAPHY.—Our most valuable source is Baxter's autobiography called *Reliquiae Baxterianae* or *Mr. Richard Baxter's Narrative of the most memorable Passages of his Life and Times* (published by Matthew Sylvester in 1696). Edmund Calamy abridged this work (1702). The abridgment forms the first volume of the account of the ejected ministers, but whoever refers to it should also acquaint himself with the reply to the accusations which had been brought against Baxter, and which will be found in the second volume of Calamy's Continuation. William Orme's *Life and Times of Richard Baxter* appeared in 1830; it also forms the first volume of "Practical Works" (1830, reprinted 1868). Sir James Stephen's interesting paper on Baxter, contributed originally to the *Edinburgh Review*, is reprinted in the second volume of his *Essays*. More recent estimates of Baxter are those given by John Tulloch in his *English Puritanism and its Leaders*, and by Dean Stanley in his address at the inauguration of the statue to Baxter at Kidderminster (see *Macmillan's Magazine*, xxxii., 385).

There is a good portrait of Baxter in the Dr. Williams Library, Gordon square, London.

BAXTER, ROBERT DUDLEY (1827–1875), English economist and statistician, was born at Doncaster. He joined his father's firm of Baxter & Co., solicitors, with which he was connected till his death. His principal economic writings were *The Budget and the Income Tax* (1860), *Railway Extension and its Results* (1866), *The National Income* (1868), *The Taxation of the United Kingdom* (1869), *National Debts of the World* (1871), and *Local Government and Taxation* (1874); and his purely political writings included *The Volunteer Movement* (1860), *The Redistribution of Seats and the Counties* (1866), *History of English Parties and Conservatism* (1870), and *The Political Progress of the Working Classes* (1871).

See *In Memoriam R. D. Baxter* (1878), by his widow. This book contains a good analysis of his elaborate works.

BAY, an architectural term for any division of a building, between vertical lines or planes, especially the entire space included between two adjacent supports; thus the space from pier to pier in a church, including that part of the vaulting or ceiling between them, is known as a bay.

A term also applied to a roofed structure projecting from a wall and one storey high, a bay window being such a structure. When a bay window is carried on brackets, or a corbel, it is called an *oriel*. Bay windows came into use during the late Gothic period. Although found throughout Europe, they are peculiarly character-

istic of England. They usually occur at the end of the great hall of large Tudor and Jacobean manor houses and castles, reserved for the lord's dais, from which they open. Occasionally there is one on each side of the hall at each end of the dais. Befitting their position, they are often extremely rich, with fan vaults and window seats at the sill. They are also found in similar positions in the great halls of the English colleges. During the Jacobean period their use was much increased and they are found on the fronts of houses wherever an accent was desired.

BAYA: see **CASTE**.

BAYAMO, an old inland city on the north slope of the Sierra Maestra in Santiago province, Cuba. Pop. (1919) 4,102. It lies on a plain by the Bayamo river, in a fertile country, but isolated from sea and from railway. Its older parts are extraordinarily irregular. The streets are of all widths and of all degrees of crookedness, and run in all directions. Bayamo was the third of the seven cities founded by Diego Velazquez, and was established in 1513. During much of the 16th century it was one of the most important agricultural and commercial settlements of the island. Its inland situation gave it relative security against the pirates who then infested West Indian seas, and the misfortunes of Santiago were the fortunes of Bayamo. Down the river Cauto, then open to the sea for vessels of 200 tons, and through Manzanillo, Bayamo drove a thriving contraband trade that made it at the opening of the 17th century the leading town of Cuba. A tremendous flood, in 1616, choking the Cauto with trees and wrecked vessels, cut it off from direct access to the sea; but through Manzanillo it continued a great clandestine traffic with Curaçao, Jamaica, and other foreign islands all through the 17th and 18th centuries. Bayamo was then surrounded by fine plantations. It was a rich and turbulent city. In the war of 1868–78 it was an insurgent stronghold; near it was fought one of the most desperate conflicts of the war, and it was nearly destroyed by the opposing parties. Bayamo was the birthplace and the home of Carlos Manuel de Céspedes (1819–74), first president of the "first" Cuban republic, and was also the birthplace and home of Tomás Estrada Palma (1835–1908), first president of the present Cuban republic.

BAYAMÓN, an interior town in Porto Rico. The population of the town itself was 10,411 by the census of 1920 and 13,688 in 1928. The population of the municipal district in 1920 was 30,739. The town is situated in a beautiful and fertile valley about 12m. from San Juan, the capital of Porto Rico. It is one of the oldest towns in the island, having its origin in a small community known as Pueblo Viejo, founded in 1509 by Ponce de León. The municipal district claims the distinction of being the one in which the first city in Porto Rico, originally known as "Villa de Caparra" was founded by the Spanish settlers. It was the capital of the island until 1521, when the present city of San Juan was made the seat of local government. The present town and municipality of Bayamón was founded in 1772.

Bayamón is the centre of one of the most productive fruit regions in Porto Rico. Oranges, limes, lemons, bananas, grapefruit and pineapples are grown on well managed fruit farms, and canning is one of the principal industries. Sugar, tobacco and coffee are also produced in the municipality. The town is on the line of the American railroad, is connected also with San Juan by a trolley line, and motor-buses make frequent trips to and from the capital.

BAYARD, PIERRE TERRAIL, SEIGNEUR DE (1473–1524), French soldier, the descendant of a noble family, nearly every head of which for two centuries past had fallen in battle, was born at the château Bayard, Dauphiné (near Pontcharra, Isère), about 1473. In 1494 he accompanied Charles VIII. into Italy, and was knighted after the battle of Fornova (1495), where he had captured a standard. Shortly afterwards, entering Milan alone in ardent pursuit of the enemy, he was taken prisoner, but was set free without a ransom by Lodovico Sforza. In 1502 he was wounded at the assault of Canossa. Bayard was the hero of a celebrated combat of 13 French knights against an equal number of Germans, and his restless energy and valour were conspicuous throughout the Italian wars of this period. On one occasion it is

said that, single-handed, he made good the defence of the bridge of the Garigliano against about 200 Spaniards, an exploit that brought him such renown that Pope Julius II. sought to entice him into the papal service, but unsuccessfully. In 1508 he distinguished himself again, at the siege of Genoa by Louis XII., and early in 1509 the king made him captain of a company of horse and foot. At the siege of Padua he won further distinction, not only by his valour, but by his consummate skill. At Brescia in 1512 his valour in first mounting the rampart cost him a severe wound. Before his wound was completely healed, he hurried to join Gaston de Foix, under whom he served in the terrible battle of Ravenna (1512). In 1513, when Henry VIII. of England routed the French at the battle of the Spurs (Guinegate, where Bayard's father had received a lifelong injury in a battle of 1479), Bayard in trying to rally his countrymen found his escape cut off. Unwilling to surrender, he rode suddenly up to an English officer who was resting unarmed, and summoned him to yield; the knight complying, Bayard in turn gave himself up to his prisoner. The king released him without ransom, merely exacting his parole not to serve for six weeks. On the accession of Francis I. in 1515, Bayard was made lieutenant-general of Dauphiné; and after the victory of Marignan, to which his valour largely contributed, he had the honour of conferring knighthood on his youthful sovereign. When war again broke out between Francis I. and Charles V., Bayard, with 1,000 men, held Mézières, which had been declared untenable, against an army of 35,000 and after six weeks compelled the imperial generals to raise the siege. This stubborn resistance saved central France from invasion. All France rang with the achievement, and Francis gained time to collect the royal army which drove out the invaders (1521). After allaying a revolt at Genoa, and striving with the greatest assiduity to check a pestilence in Dauphiné, Bayard was sent, in 1523, into Italy with Admiral Bonnivet, who, being defeated at Robecco and wounded in a combat during his retreat, implored Bayard to assume the command and save the army. He repulsed the foremost pursuers, but in guarding the rear at the passage of the Sesia was mortally wounded by an arquebus ball (April 30, 1524). He died in the midst of the enemy. His body was restored to his friends and interred at Grenoble.

Chivalry, free of fantastic extravagance, is perfectly mirrored in the character of Bayard. As a soldier he was one of the most skilful commanders of the age. He obtained exact and complete information of the enemy's movements by careful reconnaissance and by a well-arranged system of espionage. In the midst of mercenary armies Bayard remained absolutely disinterested, and to his contemporaries and his successors he was, with his romantic heroism, piety and magnanimity, the fearless and faultless knight, *le chevalier sans peur et sans reproche*. His gaiety and kindness won him, even more frequently, another name bestowed by his contemporaries, *le bon chevalier*.

Contemporary lives of Bayard are the following:—*Le loyal serviteur* (? Jacques de Maille); *La très joyeuse, plaisante, et recreative histoire . . . des faiz, gestes, triumphes et prouesses du bon chevalier sans paour et sans reproche, le gentil seigneur de Bayart* (original edition printed at Paris, 1527, the modern editions are very numerous, those of M. J. Roman and of L. Larchey appeared in 1878 and 1882, and that of O. H. Trior in 1927); Symphorien Champier, *Les Gestes, ensemble la vie du preulx chevalier Bayard* (Lyons, 1525); Aymar du Rivail, *Histoire des Allobroges* (edition of de Terrebasse, 1844), see *Bayard in Répertoire des sources historiques*, by Ulysse Chevalier, and in particular A. de Terrebasse, *Hist. de Pierre Terrail, seigneur de Bayart* (1st ed., Paris, 1828; 5th ed., Vienna, 1870).

BAYARD, THOMAS FRANCIS (1828–1898), American diplomatist, was born in Wilmington, Del., on Oct. 29, 1828, of a distinguished family. His great-grandfather, Richard Bassett (1745–1815), governor of Delaware; his grandfather, James Asheton Bayard (1767–1815), a prominent Federalist, and one of the United States commissioners who negotiated the treaty of Ghent with Great Britain after the War of 1812; his uncle, Richard Henry Bayard (1796–1868); and his father, James Asheton Bayard (1799–1880), a well-known constitutional lawyer, all represented Delaware in the U.S. Senate. In 1848 he began the study of law in the office of his father, and was admitted to the bar in 1851 and practised chiefly in Wilmington. He was a U.S. senator from

Delaware from 1869 to 1885. His abilities made him a leader of the Democrats in the Senate, and his views on financial and legal questions gave him a high reputation for statesmanship. He was a member of the electoral commission of 1877. In the Democratic national conventions of 1872, 1876, 1880 and 1884 he received votes for nomination as the party candidate for the presidency. He was secretary of State, 1885–1889, during the first administration of President Cleveland, and pursued a conservative policy in foreign affairs. As ambassador to Great Britain, 1893–97, he was considered by many Americans to have become too partial to English ways and for the expression of some criticisms regarded as unfavourable to his own countrymen, the House of Representatives went so far as to pass on Nov. 7, 1895, a vote of censure on him. The value of his diplomacy was, however, fully recognized in the United Kingdom, where he worthily upheld the traditions of a famous line of American ministers. He was the first representative of the United States in Great Britain to hold the diplomatic rank of an ambassador. He died in Dedham, Mass., on Sept. 28, 1898.

See Edward Spencer, *Public Life and Services of T. F. Bayard* (1880); George F. Parker, "Thomas Francis Bayard," in *Contemporary Review*, vol. lxxiv., p. 674–680 (1898).

His son THOMAS FRANCIS BAYARD (1868–), lawyer and politician, was born in Wilmington, Del., June 4, 1868. He graduated at Yale in 1890, studied law at the Yale law school, 1890–91, and in his father's office in Wilmington until his admission to the Delaware bar in 1893. From 1906 to 1916 he was chairman of the Democratic State committee, and from 1917 to 1919 was city solicitor, Wilmington. In 1922 he was elected to the U.S. Senate. He was the fifth member of his family to attain that office, his great-great-grandfather, great-grandfather, great-uncle and father, each in his time, having been chosen U.S. senator. This remarkable record for distinguished public service, generation after generation, is probably unequalled by any other family in America.

BAYAZID, a border fortress of Asiatic Turkey, chief town of a vilayet of the same name, situated close to the frontiers of Russia and Persia, and looking across a marshy plain to the great cone of Ararat, at a general altitude of 6,000 feet. It occupies a site of great antiquity, as the cuneiform inscriptions on the neighbouring rocks testify; the town stands on the site of the old Armenian town of Pakovan. The great trade route from Trebizond by Erzerum into north-west Persia crosses the frontier at Kizil Dize a few miles to the south and does not enter the town. A knoll above the town is occupied by the half-ruined fort or palace of former governors, built for Mahmud Pasha by a Persian architect and considered one of the most beautiful buildings in Turkey. It contains two churches and a monastery, the Kasa Kilissa, famous for its antiquity and architectural grandeur. The cuneiform inscriptions are on the rock pinnacles above the town, with some rock chambers, indicating a town or fortress of the Vannic period. Pop (1927), 20,467.

BAYBAY, a municipality (with administration centre and 31 barrios or districts) of the province and island of Leyte, Philippine Islands, on the west coast at the mouth of the Paghaganan river, 45m S S W. of Tacloban, the provincial capital. Pop (1918), 36,917, of whom 19,139 were males and one was white. A superior grade of abaca is exported. Other products are rice, corn, copra, sugar, cattle and horses. In 1918 it had 14 manufacturing establishments, with output valued at 1,115,400 pesos, besides 233 household industry establishments, with output valued at 67,400 pesos. Of the 16 schools 13 were public. The language is a dialect of Bisayan.

BAY CITY, a city of Michigan, United States, 100m. N N W of Detroit, built on both sides of the Saginaw river near its outfall into Saginaw bay (Lake Huron); a port of entry and the county seat of Bay county. It has 17m. of river frontage, and the channel has a uniform depth of 18 feet. It is served by the Michigan Central, the Grand Trunk, the Pere Marquette, the Detroit and Mackinac, and the Michigan (electric) railways, and by lake steamers; and has an airport. The population in 1920 was 47,554, of whom 8,954 were foreign-born white (3,367 from Canada and 1,256 from Germany); and in 1927 was estimated at over 50,000.

Bay City is in the midst of Michigan's coal-fields, and of a fertile region producing large quantities of sugar-beet and diversified crops. It has extensive fisheries; a large produce commission business; large manufactures of beet-sugar and chicory, cigars, chemicals, hosiery and knitted goods, launches and motor-boat engines, pickles, cement, radio outfits, machinery, knock-down houses, veneer, maple flooring and other wood-working industries. The output of the 90 manufacturing establishments within the city limits

BY COURTESY OF BAY CITY CHAMBER OF COMMERCE
WASHINGTON AVENUE, THE MAIN BUSINESS STREET OF BAY CITY, MICH.,
BUILT BY THE LOCAL MANUFACTURING AND LUMBERING INTERESTS

in 1925 was valued at \$31,120,674. The assessed valuation of property in 1926 was \$48,197,345. Bay City has a planning commission and a commission-manager form of government.

Fishermen and traders as early as 1837 made settlements here, called Lower Saginaw and Portsmouth. By 1859, when the village of Bay City was incorporated, a number of sawmills were in operation. Salt, discovered under the village in 1859, also became an important factor in its development. At the height of the lumbering industry it shipped more rough lumber than any other place in the country. Gradually industries developed which dressed and manufactured the lumber before shipping, and in recent years great quantities of timber have been imported from Canada and the Upper Peninsula. Coal was discovered in 1895. The city was incorporated in 1865, with a population of 3,359, which grew to 27,628 in 1900. In 1905 West Bay City, which had a population of 13,119 in 1900, was consolidated with it.

BAYEUX, town of France, capital of an arrondissement in the department of Calvados, 18m. N.W. of Caen. Pop. (1926) 6,489. It is situated on the Aure, five miles from the English Channel. Bayeux, the Augustodurum of the Romans, afterwards Civitas Baiocassium, had a bishopric from the late 4th century. Taken in 890 by the Scandinavian Rollo, it was soon after peopled by the Normans, one of whom, Duke Richard I., built about 960 a castle which survived till the 18th century. During quarrels between sons of William the Conqueror it was pillaged by Henry I. in 1106, and later it underwent siege and capture on several occasions during the Hundred Years' War and the religious wars of the 16th century. Till 1790 it was the capital of the Bessin, a district of lower Normandy. Its cathedral retains nave-arches and portions of the western towers from the Romanesque (12th century) church. The main structure is 13th century Gothic; the central tower is 15th century, with a modern top-storey. The church is one of the finest in Normandy, its crypt is 11th century, restored in the 15th century. The former bishops' palace (11th-14th centuries) is now the hôtel-de-ville, law courts, etc. Bayeux possesses many quaint timbered houses and stone mansions in its quiet streets. The museum contains the celebrated Bayeux tapestry. Lace-making and the manufacture of porcelain for domestic and laboratory purposes are carried on. The town is the seat of a bishop and of a sub-prefect; it has tribunals of first instance and of commerce, and an ecclesiastical seminary.

BAYEUX TAPESTRY, THE. This venerable relic consists of a band of linen, 23ft. long and 20in. wide, now light brown with age, on which have been worked with a needle, in worsteds of eight colours, scenes representing the conquest of England by the Normans. Of these scenes there are 72 beginning with Harold's visit to Bosham on his way to Normandy, and ending with the flight of the English from the battle of Hastings.

though the actual end of the strip has perished. Along the top and the bottom run decorative borders with figures of animals, scenes from fables of Aesop and of Phaedrus, from husbandry and the chase, and occasionally from the story of the Conquest itself (see **EMBROIDERY**). Formerly known as the *Toile de St. Jean*, it was used on certain feast days to decorate the nave of Bayeux cathedral. Narrowly escaping the perils of the Revolution, it was exhibited in Paris, by Napoleon's desire, in 1803-04, and has since been in civil custody at Bayeux, where it is now exhibited under glass.

"The noblest monument in the world relating to our old English history," as William Stukeley described it in 1746, it has been repeatedly described, discussed and reproduced, both in France and in England since 1730. The best coloured reproduction is that by C. A. Stothard in 1818, published in the sixth volume of *Vetusta Monumenta*; but in 1871-72 the "tapestry" was photographed for the English education authorities by E. Dossetter.

Local tradition assigned the work to the Conqueror's wife. F. Pluquet, in his *Essai historique sur la ville de Bayeux* (Caen, 1829), was the first to reject this belief, and to connect it with the Conqueror's half-brother Odo, bishop of Bayeux, and this view, which is now accepted, is confirmed by the fact that three of the bishop's followers mentioned in Domesday Book are among the very few named figures on the tapestry. That Odo had it executed for his cathedral seems tolerably certain, but whether it was worked by English fingers or not has been disputed, though some of the words upon it have been held to favour that view. Freeman emphatically pronounced it to be "a contemporary work," and historically "a primary authority . . . in fact the highest authority on the Norman side." As some of its evidence is unique, the question of its authority is important, and Freeman's conclusions have been practically confirmed by subsequent discussion. In 1902 M. Marignan questioned, on archaeological grounds, the date assigned to the tapestry, as the Abbé de la Rue had questioned it 90 years before; but his arguments were refuted by Gaston Paris and M. Lanore, and the authority of the tapestry was vindicated.

See E. A. Freeman, *Norman Conquest*, Vol. iii. (ed. 1875), with summary of the discussion to date; *Archaeologia*, Vols. xvii-xix; Dawson Turner, *Tour in Normandy* (1820); *Gentleman's Magazine* (1837); Bolton Corney, *Researches and Conjectures on the Bayeux Tapestry* (1836-38); A. de Caumont, "Un mot sur . . . la tapisserie de Bayeux," in *Bulletin monumental de l'institut des provinces*, Vol. vii. (1841); J. Laffetay, *Notice historique et descriptive sur la tapisserie . . .* (1874); J. Comte, *Tapisserie de Bayeux*; F. R. Fowke, *The Bayeux Tapestry* (ed. 1898); Marignan, *Tapisserie de Bayeux* (1902); G. Paris, "Tapisserie de Bayeux," in *Romania*, Vol. xxxi.; Lanore, "La Tapisserie de Bayeux," in *Bibliothèque de l'école des chartes*, Vol. lxiv. (1903); and J. H. Round, "The Bayeux Tapestry," in *Monthly Review*, xvii. (1904). (J. H. R.)

BAYEZID I. (1347-1403), Ottoman sultan, surnamed YILDERIM or "LIGHTNING," from the great rapidity of his movements, succeeded his father, Murad I., on the latter's assassination on the field of Kossovo, 1389, and signalized his accession by ordering at once the execution of his brother Yakub, who had distinguished himself in the battle. He was the first Ottoman sovereign to be styled "sultan." After routing the chivalry of Christendom at the battle of Nikopoli in 1396, he attacked Greece, and Constantinople would doubtless have fallen before his attack had not the emperor Manuel Palaeologus bought him off by timely concessions, which reduced him practically to the position of Bayezid's vassal. He met with an overpowering check at the hands of Timur (Tamerlane). Utterly defeated at Angora by the Mongol invader, Bayezid became his prisoner and died in captivity some months later.

Bayezid married Devlet Shah Khatun, a daughter of the prince of Kermian, who brought him in dowry Kutaiah and its dependencies.

BAYEZID II. (1447-1512), sultan of Turkey, was the son of Mohammed II., whom he succeeded in 1481. Before he could establish himself on the throne a long struggle ensued with his brother Prince Jem and he succeeded only after pacifying the janissaries with a large *placebo*. Being routed, Jem fled for

BAYEUX TAPESTRY

PLATE I

BY COURTESY OF JAMES S. PRESS AGENCY

PANELS FROM THE BAYEUX TAPESTRY

The Bayeux Tapestry, now in the museum at Bayeux, Normandy, was originally composed of 76 panels, of which 72 still exist; 12 are shown in this and the following plates. The tapestry, which is 230 feet long and 20 inches wide, is embroidered in coloured wools on a background of coarse linen. It is believed to have been made at the request of Bishop Odo, a half-brother of William of Normandy, for the cathedral at Bayeux. The panels set forth in great detail the history of the Norman Conquest and form an unequalled record of the customs of the time. From the point of view of design the Bayeux Tapestry holds a place of unique importance in mediaeval art.

1. From panels 52 and 53. At the left, building of earthworks for William's camp at Hastings. Centre, a messenger brings to William at Hastings news of Harold. At the right a woman and child escape from a house to which soldiers are setting fire.
2. From panels 50 and 51. The serving of a meal, and, in the centre, the bishop blessing the meal at table. At the right William is seen between his two half-brothers, Bishop Odo and Robert of Mortain.
3. From panels 35 and 36. An English ship coming to Normandy. At the right Duke William orders the building of a fleet.
4. From panels 37, 38 and 39. Details of ship-building. Cutting and planing timber, building the hulls, and launching by means of reeves and blocks.

BAYEUX TAPESTRY

FROM "VETUSTA MONUMENTA" BY COURTESY OF THE SOCIETY OF ANTIQUARIES LONDON

FURTHER PANELS FROM THE BAYEUX TAPESTRY

1. From panels 33 and 34. Harold is offered the crown, and in the centre is shown crowned; the Archbishop Stigand (Stigant) is at his left. In the right hand panel is shown the appearance of a comet (now known to have been Halley's comet) which occurred at that time and was regarded as an omen of evil.
2. The battle of Hastings, the English defending the ridge against the French. The movement, line and balance of the masses of light and shade make these panels one of the best illustrations of the sense of rhythm and composition found in the Bayeux Tapestry.

refuge to the Knights of St. John at Rhodes, who, in spite of a safe-conduct granted to him, accepted a pension from Bayezid as the price for keeping him a close prisoner (*see* AUBUSSON, PIERRE D').

By common consent Prince Jem was ultimately entrusted to Pope Innocent VIII., who used him not only to extract an annual tribute from the sultan, but to prevent the execution of Bayezid's ambitious designs in the Mediterranean. The prince, who had lived on excellent terms with Alexander VI., died at Naples in Feb. 1495, possibly as the result of excesses in which he had been deliberately encouraged by the pope.

Bayezid showed little of the aggressive spirit of his warlike predecessors; and Machiavelli said that another such sultan would cause Turkey to cease being a menace to Europe. He abandoned the attack on Rhodes at the first check, made concessions for the sake of peace to Venice, and reduced the tribute due from Ragusa. His wars were of the nature of raids on the Dalmatian coast and into Croatia, Hungary, Moldavia and Poland. The threat of the growing power of Venice, which had acquired Cyprus in 1489, at last roused him to a more serious effort; and in 1499 the war broke out with the republic, which ended in 1502 by the annexation to Turkey of Lepanto and Modon, Coron and Navarino in the Morea. Bayezid himself conducted the siege of Modon in 1500.

The comparative inactivity of Bayezid as regards Europe was partly due to preoccupation elsewhere. In the south he was threatened by the dangerous rivalry of Sayf ad-Din, the Mameluke sultan of Egypt, who had extended his power northwards as far as Tarsus and Adana. In 1488, the Mamelukes gained a great victory over the Ottomans, but in 1491 a peace was made which was not again broken till after Bayezid's death. From Persia too, where the decisive battle of Shurur (1502) had raised Ismail to power, danger threatened the sultan, and the latter years of his reign were troubled by the spread, under the influence of the new Persian power, of the Shi'ite doctrine in Kurdistan and Asia Minor. The forces destined to maintain his authority in Asia had been entrusted by Bayezid to his three sons, Ahmed, Corcud and Selim; and the sultan's declining years were embittered by their revolts and rivalry. Soon after the great earthquake of 1509, which laid Constantinople in ruins, Selim, the ungovernable pasha of Trebizond, appeared before Adrianople, where Bayezid had sought refuge. The sultan had designated Ahmed as his successor, but Selim, though temporarily defeated, succeeded in winning over the janissaries, and Bayezid abdicated. He was responsible for the erection of several very fine mosques. That specially known by his name was built in 1505 at Constantinople and is still standing.

See J. B. Bury in the *Cambridge Modern History*, vol. i. chap. iii. and bibliography p. 700.

BAY ISLANDS, a group of small islands in the Caribbean sea off the north coast of Honduras, now a part of the national territory of Honduras but for a time (1852-59) under the British flag. The total population is about 4,000, of whom half live in the town of Roatan or Coxin's Hole, which is the capital of the Honduran department of *Islas de la Bahia*. The chief industries are agricultural, bananas and pineapples being shipped to New Orleans and some coconuts being grown for the preparation of copra. There is still some lumber-cutting, and wild game, including peccaries and deer, abound. The largest of the islands is Roatan, 30m. long by 9m. wide, the next in size being Guanaja (or Bonacca), 9m. long by 5m. broad. The other islands in the archipelago are Utila, Barbareta, Helena and Morat. The Puercos or Hog islands, a part of the group, include several small islands, and there are a number of cays or islets. The soil is fertile, the forests luxuriant and the highest point in the archipelago is about 900ft. above the sea, in the hills of Roatan. The island of Guanaja was discovered by Columbus in 1502 and the islands were populated in the 17th century by British and the "Carib Indians" brought from the mainland by the British to cut logs. The inhabitants are for the most part descendants of these woodcutters, the estimated number of aborigines on the islands being some 500, out of the total of 4,000. The inhabitants erected forts in Roatan in 1742, and the islands were formally annexed to Great Britain in 1852, to be ceded to Honduras seven years later.

BAYLE, PIERRE (1647-1706), French philosopher and man of letters, was born on Nov. 18, 1647, at le Carla-le-Comte, near Pamiers (Ariège), the son of a Calvinist minister. He entered the Jesuit college at Toulouse. He adopted the Roman Catholic faith (1669), but reverted to Calvinism, and in order to avoid persecution, fled to Geneva, where he became acquainted with Cartesianism. Returning to France, he acted as tutor for some time, and was then appointed (1675) to the chair of philosophy at the Protestant university of Sedan. On its suppression in 1681, he became professor of philosophy and history at Rotterdam where, in 1682, he published his *Pensées diverses sur la comète de 1680* and his critique of Maimbourg's history of Calvinism. Two years later he began to publish the famous journal, *Nouvelles de la république des lettres*, which was the first thorough-going attempt to popularize literature. He was deprived of his chair in 1693, in consequence of the attribution to him of the tract *Avis important aux réfugiés*. He now gave his whole attention to his *Dictionnaire historique et critique*, a work displaying a universal curiosity and considerable erudition, which had great influence on the French *philosophes* of the 18th century, especially on Voltaire. Bayle's dictionary was the source from which the French encyclopaedists drew many of their arguments, and the plan outlined by Diderot for the *Encyclopédie* itself was based on the method of Bayle's book. "Articles dealing with respectable prejudices" wrote Diderot, "must expound them deferentially; the edifice of clay must be shattered by referring the reader to the other articles in which the opposite truths are established on sound principles. This method of enlightening the reader has an immediate influence on those who are quick of apprehension, an indirect and latent influence on all." This is really the principle on which Bayle acted in his criticism of popular beliefs. He was a sceptic, strongly objecting to Spinoza's monism and inclined to manichaeism. He regarded the realms of faith and reason as mutually exclusive. He taught that the history of civilization was the history of man's effort to overcome his own nature, but he was nevertheless politically timid and conservative. His writings paved the way for revolution, but he was no revolutionary himself. On one point only was he frankly an advocate of a complete change of front. Three years before Locke wrote his *Letters on Toleration* Bayle published his *Commentaire philosophique sur le Compelle Entrare*, in which he argued that freedom of thought was a natural right, and that even an atheist was not necessarily a bad citizen.

Bayle died in exile at Rotterdam on Dec. 28, 1706. Two centuries later, a statue in his honour was erected in his native place, "la réparation d'un long oubli."

BIBLIOGRAPHY.—*Editions*:—*Dictionnaire historique et critique* (1695-97, 1702, enlarged; that of P. des Maizeaux (Amsterdam, 1740), is the best), a number of English translations exist; *Les Oeuvres de Bayle* (The Hague). *See* P. des Maizeaux, *Vie de Bayle* (Amsterdam, 1730); L. BAY LEAF, the leaf of the sweet bay tree, a species of laurel (*Laurus nobilis*) which grows in Mediterranean countries. The dried leaves are used as a condiment for flavouring many fish and meat dishes. The peculiar flavour of bay leaves is especially prized for seasoning thin soups and broths. An extract from the leaves is used by barbers.

BAYLEY, WILLIAM SHIRLEY (1861-), American geologist, was born in Baltimore, Md., on Nov. 10, 1861. He graduated at Johns Hopkins university in 1883 and in 1886 received the degree of doctor of philosophy from that institution. From 1888 until 1906 he taught in Colby college and Lehigh university and in the latter year became a member of the faculty of the University of Illinois. In 1889 he was appointed to the United States geological survey.

Among his publications are: *Elementary Crystallography* (1910); *Minerals and Rocks* (1915); and *Descriptive Mineralogy* (1916).

BAYLISS, SIR WILLIAM MADDOCK (1866–1924), English physiologist, only son of Moses Bayliss, iron manufacturer, was born at Wolverhampton, 1866. In 1881 he entered University college, London, as a medical student, but preferring the pursuit of science to the practice of medicine, in 1885 he went to Oxford and continued to study physiology under his former teacher, Burdon Sanderson. In 1888 he returned to London and worked in the physiological laboratories of University college, where he carried on his researches for 35 years. Freed by circumstances from the necessity of earning a livelihood he was able to devote himself entirely to scientific discovery.

Bayliss was one of the most distinguished physiologists of his generation. His researches covered a wide range and resulted in valuable discoveries, the more important being those on the electromotive phenomena associated with the heart's action, the nervous mechanisms controlling the activities of the viscera and of the circulation to the various parts of the body, the application of recently acquired knowledge of surface phenomena to physiology and the discovery, in conjunction with Starling, of "secretin," the hormone which excites the pancreas to secrete its digestive juice when food is passing into the duodenum. During the World War he experimentally investigated the nature of wound-shock and devised methods for treatment which were widely and successfully used and saved many lives. Bayliss' original contributions to science appeared in the scientific journals devoted to physiology and biochemistry between the years 1890–1924. His *Principles of General Physiology*, published in 1914, had a world-wide influence and was regarded as the best exposition of the foundations of modern physiology. Bayliss' pre-eminence as a discoverer was suitably recognized by learned societies at home and abroad. In 1919 he received from the Royal Society the Copley Medal, the highest honour for philosophical researches, last given to a physiologist in 1739. He was knighted in 1922.

BAYLO, in diplomacy, the title borne by the Venetian representative at Constantinople. His functions were originally in the nature of those of a consul-general, but from the 16th century onwards he had also the rank and functions of a diplomatic agent of the first class. (See DIPLOMACY.)

BAYLY, THOMAS HAYNES (1797–1830), English popular song-writer and dramatist, was born at Bath on Oct. 13, 1797. He was educated at Winchester and at St. Mary Hall, Oxford. In 1824 he became famous with the popular song "I'd be a butterfly," which he followed up with "We met—'twas in a crowd," "She wore a wreath of roses," "Oh, no, we never mention her," and other ditties. He set some of his songs to music himself; a well-known example is "Gaily the troubadour." Bayly also wrote two novels, *The Aylmers* and *A Legend of Killarney*, and numerous plays. His most successful dramatic piece was *Perfection*, which was produced by Madame Vestris and received high praise from Lord Chesterfield. Bayly died on April 22, 1839. His *Collected Works* (1844) contain a memoir by his wife.

BAYNE, PETER (1830–1896), Scottish journalist and author, was born at Fodderty, Ross-shire, and educated at Marischal college, Aberdeen, and afterwards at Edinburgh university. His works include *The Christian Life, Social and Individual* (1855); *Essays, Bibliographical and Critical* (1859); *Life of Hugh Miller* (1871); *Martin Luther, his Life and Work* (1887); *The Free Church of Scotland* . . . (2nd ed. 1894).

BAYNES, THOMAS SPENCER (1823–1887), English editor and man of letters, the son of a Baptist minister, was born at Wellington, Somerset. At Edinburgh university he was a pupil of Sir William Hamilton, whose assistant he became, and of whose views on logic he became the authorized exponent. This teaching was embodied in his *Essay on the New Analytic of Logical Forms* (1850), which was followed in the next year by a translation of Arnauld's *Port Royal Logic*. He became editor (1850) of the *Edinburgh Guardian*, then (1858) assistant editor of the *Daily News*, and in 1864 professor of logic at St. Andrews. He took over the editorship of the 9th edition of the *Encyclopædia Britannica* in 1873, but in 1881 his health rendered it necessary to give him a coadjutor in the person of Prof. W. Robertson Smith. Baynes worked on the book until his death shortly before its completion.

See a memoir by Prof. Lewis Campbell prefixed to his *Shakespeare Studies and Other Essays* (1894).

BAYONET, a short thrusting weapon, fixed to the muzzle or fore-end of a rifle or musket and carried by troops armed with the latter weapons. The origin of the word is disputed, but there is some authority for the supposition that the name is derived from the town of Bayonne, where the short dagger called *bayonnette* was first made towards the end of the 15th century. The elder Puységur, a native of Bayonne, says (in his memoirs, published posthumously in Paris, 1747) that when he was commanding the troops at Ypres in 1647 his musketeers used bayonets consisting of a steel dagger fixed in a wooden haft, which fitted into the muzzle of the musket—in fact plug-bayonets. It has been established from the evidence in courts-martial held on some English soldiers—not pikemen—at Tangier in 1663–64, for using their "daggers" on their comrades, that the troops in Tangier used, and that these "daggers" were, plug-bayonets. In 1671 plug-bayonets were issued to the French regiment of fusiliers then raised. They were issued to part of an English dragoon regiment in 1672, although withdrawn in 1674, and to the Royal Fusiliers when raised in 1685. The Foot Guards were armed with them in 1686. The danger incurred by the use of this bayonet (which put a stop to all fire) was felt so early that the younger Puységur saw a ring-bayonet in 1678 which could be fixed without stopping the fire. The English defeat at Killiecrankie in 1689 was due (among other things) to the use of the plug-bayonet; and shortly afterwards the defeated leader, Gen. Mackay, introduced a ring-bayonet of his own invention. A trial with badly fitting socket or zig-zag bayonets was made after the battle of Fleurus, 1690, in the presence of Louis XIV, who refused to adopt them. Shortly after the peace of Ryswick (1697) the English and Germans abolished the pike and introduced these bayonets, and plates of them are given in Surirey de St. Remy's *Mémoires d'Artillerie*, published in Paris in that year; but owing to a military cabal they were not issued to the French infantry until 1703. Henceforward the bayonet became, with the musket or other firearm, the typical weapon of infantry. This bayonet remained in the British service until 1805, when Sir John Moore introduced a bayonet fastened to the musket by a spring clip. The triangular bayonet (so called from the cross-section of its blade) was used in the British army until the introduction of the magazine rifle, when it was replaced by the sword-bayonet or dagger-bayonet. Sword-bayonets—weapons which could be used as sword or dagger apart from the rifle—had long been in use by special troops such as engineers and rifles, and many ingenious attempts have been made to produce a bayonet fitted for several uses. A long curved sword-bayonet with a saw-edged back was formerly used by the Royal Engineers, but all troops came to be supplied with the plain sword-bayonet, which was used during the World War.

Racial psychology plays its part in the choice of design. The British race prefers a club to deal with troublesome neighbors, whereas the Latin races "knife" each other. The effect of these inherent characteristics is reflected in the type of bayonet used. The lessons of the World War indicate that some kind of bayonet may still be necessary in order to frighten one's enemy and to give oneself confidence in close fighting, but the occasions when it will be actually driven home will probably be rare. For this reason the new British (1928) pattern is nothing more than a spike, the blade, cruciform in section, being only 8 in. long and no thicker than a lead pencil. Handiness with the rifle is aimed at, a feature easier to attain with a short than with a long bayonet. Its powers of penetration are, however, very great and the length is adequate to deal with an enemy in winter clothing. The U.S.A. pattern is that of 1905, 16 in. long; the front edge is sharpened throughout its length and the back edge 5 in. from the point. The French army has replaced its long cross-section sword-bayonet for a shorter one of 15½ in. blade, which indicates that its utility in war is not considered so great as before the World War. The German pattern is the same as before the World War; viz., sword-bayonet, 37.9 cm. in length and 1 lb. 4 oz. in weight. The Belgians have now adopted a short model, 9½ in. long. Tank personnel are armed with a dagger on mobilization. The Italian army uses a dagger-shaped bayonet

of 11½ in. weighing 12 oz. The Japanese pattern is a straight single-edged weapon, 15 in. long, weighing 15½ oz. Bayonet training occupies a much larger portion of time in the Japanese army than in others. The army of the Netherlands has a dagger type bayonet 1 ft. 6.85 in. long, weighing (without scabbard) 10 oz. The Polish army uses various patterns of rifle, French, German and Austrian, consequently the bayonets vary with the rifle. The infantry bayonet of the Swiss army is a 1911 pattern, quadrangular dagger type weighing 430 g. In the Swiss artillery unmounted N.C.O.s. and gunners and men of mountain batteries carry a sword-bayonet; the heavy artillery gunners are armed with the 1911 carbine and dagger-bayonet. The Czechoslovakian army is armed with a bayonet for a Mauser rifle, the blade being 11.8 in. long and weighing 14½ oz. The army of Yugoslavia uses various types of rifles with bayonets corresponding, whether Austrian, French or old Serbian. A similar situation obtains in the armies of the Baltic States (Estonia, Latvia and Lithuania).

BAYONNE, town of France, capital of an arrondissement in the department of Basses-Pyrénées, 66 m. W.N.W. of Pau on the Southern railway. Pop. (1926), 27,804. A first-class fortified place, it is situated at the confluence of Adour and Nive, about 3½ m. from the sea. In the 3rd century Bayonne (*Lapurdum*) was a Roman military post and the principal port of Novempopulana. The name survives in the title Pays de Labourd, *i.e.*, the see of Bayonne. The present name of the town, probably Basque in origin, appears first in the 12th century. In the early middle ages it belonged to the dukes of Aquitaine, but passed to the kings of England in 1154. It received communal rights in 1216. In 1451 it strenuously opposed the French, who eventually occupied it. Its maritime commerce had suffered owing to silting and deflection of the Adour. New fortifications were constructed under Louis XII and Francis I, and in 1523 the town held out against a Spanish army. Its position near the Spanish frontier led to its choice for diplomatic interviews, as in 1572 and 1808. In 1814, after a severe siege, Bayonne was occupied by the English (*see* PENINSULAR WAR). The two rivers divide the town into three nearly equal parts. Grand Bayonne, with its old arcaded streets, lies on the left bank of the Nive; Petit Bayonne lies between the right bank of the Nive and the Adour; the new town (Faubourg St. Esprit), with the railway station, occupies the right bank of the Adour. To the north-west of the town are the Allées Marines, bordering the Adour, and the Allées Paulmy, skirting the fortifications. The Gothic cathedral of Ste. Marie in Grand Bayonne, 13th–15th centuries, consists of a choir with deambulatory and apsidal chapels (the oldest part), a transept, nave and aisles. The west towers were completed only in the 19th century when the two conspicuous spires were added. Ste. Marie contains glass windows of the 15th and 16th centuries and other rich decoration. The 13th-century cloister is over-restored but still beautiful. The Château-Vieux nearby (12th–15th centuries) is built on Roman fortifications. The Château Neuf (15th and 16th centuries) serves as barracks and prison. The commerce of Bayonne is much more important than its industries (leather and chocolate). The port consists of an outer harbour, the *rade* (roadstead) and the port proper, and occupies the course of the Adour from its mouth, which is obstructed by a shifting bar, to the Pont St. Esprit, and the course of the Nive as far as the Pont Mayou. Above these bridges there is only river navigation. Vessels drawing from 18 to 25 ft. can make the port, which, however, is tidal. Exports include wine and brandy, linen and silk materials, hams, salt, flour, mine-props, resinous material from the Pyrenees and Landes, and zinc ore. Imports: coal and Spanish minerals supplying the large metallurgical works of Le Boucau at the river mouth, the raw material necessary for the chemical works of the same town, cement, phosphates, wine and the cereals for flour mills at Pau, Peyrehorade and Orthez. The port's tonnage has increased greatly since 1900. Bayonne is the seat of a bishopric and of a sub-prefect; it has tribunals of first instance and of commerce, a chamber of commerce, and an art museum with a collection of works of the painter Léon Bonnat. There are several consulates, since Bayonne is virtually a port.

BAYONNE, a city of Hudson county, N.J., U.S.A., occupying the long, narrow peninsula (4 sq. m.) between New York and Newark bays, immediately south of Jersey City, and separated from Staten Island by the narrow Kill van Kull. It is on the main line of the Central Railroad of New Jersey, and through belt lines is connected (for freight) with the other trunk lines which have their tidewater termini on the western shore of the Hudson river. Nine miles of waterfront offer great potential docking facilities. In 1927 legislative appropriations were made for the construction by the Port of New York Authority of a vehicular bridge to Staten Island, as the final link in a comprehensive highway system for the Port district. The population was 32,722 in 1900; 76,754 in 1920, a third of which was foreign-born white, largely from Poland, Russia, Ireland and Italy; and was estimated at 93,100 in 1927.

Bayonne is one of the leading centres of the world for the refining of petroleum and the manufacture of its by-products; and it has vast coal docks, from which shipments are made to all parts of the metropolitan district. There are about 150 manufacturing establishments in all, with an annual output valued at more than \$220,000,000. During the World War Bayonne supplied boilers to a total of 1,845,000 h.p.; naval guns for hundreds of ships; 11,000 miles of wire and cable; 723 finished submarine-chasers; 7,000 tons of steel castings and 8,000 tons of iron and steel rivets; refined nickel to meet the needs of several armies and navies; and 25,000,000 barrels of gasoline, kerosene, fuel and gas oil. Other important manufactures are broad silks, elastic fabrics, borax, soap and lotions, sulphur and insecticides, copper and nickel products. The assessed valuation of property in the city in 1927 was \$158,815,057.

Bayonne was settled by the Dutch about 1665–70. It was separated from Bergen as a township in 1861, and was chartered as a city in 1869. In 1915 a commission form of government was adopted.

BAYOU (bī'ō), a marshy offshoot of a river. The term is used chiefly in the southern United States for an "ox-bow" lake left behind by a river that has abandoned its old channel in the lower stages of its course. Good examples are found in the lower Mississippi valley. In the lower reaches of a river where the country is more or less level, and the current slow, a river usually swings from side to side of its valley line in a series of curves, and in flood times there is a tendency for the water to impinge more strongly upon the concave bank. This bank will be eaten away, and the process will be repeated until finally it is cut through, leaving a loop or ox-bow lake filled with dead water, while the stream runs directly past it.

BAYREUTH, a town in the district of Upper Franconia, Bavaria, Germany, 58 m. by rail N.E. of Nürnberg. Pop. (1925) 35,312. Bayreuth was formerly the capital of an independent principality, annexed in 1791 to the kingdom of Prussia. In 1807 it was ceded to France; and in 1810 transferred to Bavaria. In Richard-Wagner-strasse is Wagner's house, with his grave in the garden. Franz Liszt (1811–1886) is buried here, as well as Jean Paul Friedrich Richter. Most of the buildings are comparatively modern, the city having suffered severely from the Hussites in 1430 and from fire in 1621. The *Stadt-Pfarrkirche* (1439) contains the monuments of the margraves of Bayreuth. The town has an active trade, chiefly in grain and horses. It manufactures woollen, linen and cotton goods, delft and other earthenware. The village of St. Georgen is a suburb to the north-east noted for its marble works.

The Wagner Theatre.—In spite of Wagner's intimacy with King Ludwig II. of Bavaria, the first plan of building a new theatre for the performance of Wagner's operas in Munich was rejected, because Wagner himself disliked the distractions of a large capital. Bayreuth possessed the desired seclusion, and the municipality furthered the scheme. In May 1872, the foundation stone of the Festspielhaus was laid, the event being commemorated by a notable performance of Beethoven's Choral Symphony in the old opera-house. The bulk of the sum for the erection of the theatre was raised by founding "Wagner Societies" from St. Petersburg (Leningrad) to Cairo, from London to New York;

and the theatre was opened in 1876 with the first complete performance of *Der Ring des Nibelungen*. The theatre, standing about a mile above the town, is built from plans of Gustav Semper, based on Wagner's ideas.

The second festival (1882) saw the performance of *Parsifal* under Hermann Levi and Franz Fischer. At later festivals, held about every second year, three works were usually given, *Parsifal* (which, until copyright expired, could be heard only here) being almost invariably one, but in 1896 the *Ring* was given alone. Frau Cosima Wagner and her son Siegfried have directed the festivals, and in spite of the high order of the performances, they have been criticized for too rigid adherence to established traditions. There was a festival in 1914, but thereafter the first was in 1924.

BAY RUM, a fragrant liquid cosmetic widely used by hairdressers. It is composed of oil of bay, called also oil of myrcia, to which has been added alcohol, water, oil of orange peel and oil of pimenta. Bay rum is one of the chief articles exported from the Virgin islands. (See BAY-RUM TREE; ALLSPICE.)

BAY-RUM TREE, a small aromatic tree (*Pimenta acris*) of the myrtle family (Myrtaceae), native to the West Indies and closely related to the allspice and the clove (*q.v.*). From the leathery leaves, sometimes 5 in. long, is distilled bay oil or oil of myrcia used in making bay rum (*q.v.*). In Jamaica the tree is called bayberry.

BAZA, a town of southern Spain, in the province of Granada. Pop. (1920) 15,935. The town overlooks a fertile vega belonging to the Hoya de Baza, one of the largest of the structural basins of upper Andalusia. The ancient collegiate church of San Maximo occupies the traditional site of a cathedral founded by the Visigothic king Reccared about 600, and afterwards converted into a mosque. There is a brisk local trade in farm produce, and in the linen, hempen goods and pottery manufactured in Baza. Sulphurous springs exist in the vicinity.

Baza, the Roman *Basti*, was made a bishopric prior to the Council of Elvira, held in 302, at which the attendance of its bishop is recorded. The *Batza* of the Muslim period, it became one of the three leading cities of the kingdom of Granada. Its siege by the Catholic Sovereigns in 1489 was accordingly critical for the continuance of the Muslim power in Spain; the Grand Turk intervened, and both siege and defence were maintained by the sale of the jewels of the ladies on the respective sides. The siege ended with the fall of the city on Dec. 4, 1489.

BAZAAR, a permanent market or street of shops, or a group of short narrow streets of stalls under one roof (Pers. *bazar*, market). The word has spread westward into Arabic, Turkish and European languages, and eastward it has invaded India, where it has been generally adopted. In southern India and Ceylon bazaar means a single shop or stall. The Malayan peoples have adopted the word as *pazar*. The meaning of the word has been much extended in English, where it is now equivalent to any sale, for charitable or mere commercial purposes, of mixed goods and fancy work.

BAZAAR MALAY: see LINGUA FRANCA.

BAZAINE, ACHILLE FRANÇOIS (1811-1888), marshal of France, was born at Versailles on Feb. 13, 1811. He entered the army as a private soldier in 1831, with a view to service in Algeria, and received a commission in 1833. He served with great distinction in Algeria, in the Crimean war, in Lombardy (1859) and in Mexico (1862-67). He was promoted marshal in 1864, and skilfully conducted the retreat of the French troops from Mexico City and their embarkation at Vera Cruz in 1867.

At the outbreak of the Franco-German War (*q.v.*) Marshal Bazaine was placed in command of the III. corps of the Army of the Rhine. How far his inaction was the cause of the disaster of Spicheren is a matter of dispute. Bazaine, indeed, when called upon for help by Frossard, who was in command of the army corps posted at Spicheren, moved part of his corps forward, but only to "take up strong positions," not to strike a blow on the battlefield. A few days later he took up the chief command, and his tenure of it is the central act in the tragedy of 1870. He found the army in retreat, ill-equipped and numerically at a great disadvantage, and the generals and staffs discouraged and dis-

trustful of one another. The question was one of extricating the army and the government from a disastrous adventure, and Bazaine's solution of it was to bring back his army to Metz. For the events which led up to the battles before Metz and the investment of Bazaine's whole army in the fortress, see FRANCO-GERMAN WAR and METZ: Battles.

It seems clearly established that the charges of treason to which later events gave so strong a colour had, as yet, no foundation in fact. The resolution to stay in the neighbourhood of Metz was based on the knowledge that if the slow-moving French army ventured far out it would infallibly be headed off and brought to battle in the open by superior numbers. In "strong positions" close to his stronghold, however, Bazaine hoped to inflict damaging repulses and heavy slaughter on the Germans, and in the main the result justified the expectation. When, before he had finally decided to stay in Metz, Bazaine attempted half-heartedly to begin a retreat on Verdun, the staff work and organization of the movement over the Moselle was so ineffective that when the German staff calculated that Bazaine was nearing Verdun, the French had in reality barely got their artillery and baggage trains through the town of Metz. After the army had passed through Metz it encountered an isolated corps of the enemy, commanded by Constantin von Alvensleben, which promptly attacked the French. At almost every moment of the day victory was in Bazaine's hands. Two corps of the Germans fought all day for bare existence. But Bazaine contented himself with inflicting severe losses on the most aggressive portions of the German army. Two days later, while the French actually retreated on Metz—taking seven hours to cover 5 to 6 m.—the masses of the Germans gathered in front of him, intercepting his communication with the interior of France. Bazaine, feeling certain that the Germans would sooner or later attack him in his chosen position, made no attempt to interfere with their concentration. The great battle was fought, and having inflicted severe punishment on his assailants, Bazaine fell back within the entrenched camp of Metz. But although he made no appeals for help, public opinion, alarmed and excited, condemned the only remaining army of France, Marshal MacMahon's "Army of Châlons," to rescue Bazaine at all costs. The adventure ended at Sedan, and with Sedan the Third Empire collapsed.

In Metz, as commander of the only organized army of France, Bazaine conceived himself to be the ruler of the country's destiny. Accordingly he engaged in a series of diplomatic intrigues. Negotiations passed between the outer world and the besieged commander, the purport of which remains still to some extent obscure, but it is beyond question that he proposed with the permission of the Germans to employ his army in "saving France from herself." The scheme, however, collapsed, and the army of the Rhine became prisoners of war to the number of 140,000. At the moment of the surrender a week's further resistance would have enabled the levies of the National Defence Government to crush the weak forces of the Germans on the Loire and to relieve Paris. But the army of Prince Frederick Charles, set free by the surrender, hurried up in time to check and to defeat the great effort at Orleans (*q.v.*). The responsibility for this crushing blow was naturally enough, and justly enough, placed on Bazaine's shoulders, and although, when he returned from captivity, the marshal enjoyed a brief immunity, he was in 1873 brought to trial before a military court. He was found guilty of negotiating with and capitulating to the enemy before doing all that was prescribed by duty and honour, and sentenced to degradation and death, but very strongly recommended to mercy. His sentence was commuted to 20 years' seclusion, and the humiliating ceremonies attending degradation were dispensed with. He was incarcerated in Île Sainte-Marguerite and treated rather as an exile than as a convict; thence he escaped in 1874 to Italy. He finally took up his abode in Madrid, where he was treated with marked respect by the Government of Alfonso XII. He died there on Sept. 23, 1888. He published *Épisodes de la guerre de 1870* (Madrid, 1883). He also wrote *L'Armée du Rhin* (Paris, 1872).

See the bibliography appended to the article FRANCO-GERMAN WAR; also memoir by C. Pelletan in *La Grande Encyclopédie*; for Bazaine's

conduct see *Basaine et l'armée du Rhin* (1873); J. Valfrey, *Le Maréchal et l'armée du Rhin* (1873); Count A. de la Guéronnière, *L'Homme de Metz* (1871); Rossel, *Les Derniers Jours de Metz* (1871). See also the article *BOURBAKI* for the curious Régnier episode connected with the surrender of Metz.

BAZALGETTE, SIR JOSEPH WILLIAM (1819–1891), English engineer, carried out many important engineering works in London, being concerned with the construction of the main drainage system and the Thames embankment. On the creation of the Metropolitan Board of Works (1855) he was at once appointed its chief engineer. His drainage plans were ready, but the work was delayed by official obstruction until 1858. Once begun, however, it was vigorously pushed on, and in 1865 the system was formally opened. The section of the Thames embankment, constructed on his plans, between Westminster and Vauxhall on the Surrey side was built between 1860 and 1869, and the length between Westminster and Blackfriars was declared open by the prince of Wales in 1870. The Chelsea embankment followed in 1871–74, and in 1876 Northumberland avenue was formed. Bazalgette was also responsible for various other engineering works in the metropolitan area, designing, for example, new bridges at Putney and Battersea, and the steam ferry between north and south Woolwich. He died before his schemes for a tunnel at Blackwall and a bridge at the Tower had taken shape; though these were built later.

BAZARD, AMAND (1791–1832), French socialist, was the founder, about 1820, of a secret society in France corresponding to the Carbonari (q.v.), called *Amis de la vérité*. Bazard himself was at the head of the central body, and, while taking a general lead, contributed extensively to the Carbonarist journal, *L'Aristarque*. An unsuccessful outbreak at Belfort ruined the society, and the leaders were compelled to conceal themselves. Bazard later became a follower of Saint-Simon, but quarrelled violently with *Enfantin* (q.v.) in 1831.

BAZAS, town in the dept. of Gironde, France, 38½ m. S.S.E. of Bordeaux. It was the capital of the *Vasates*, and the Romans made it one of the 12 cities of Novempopulana. It had a bishop at least from the 6th century to 1790, and was the chief town of the Bazadais region; it became capital of an *arrondissement* but lost this dignity in 1926. It has several historic remains and the town is in the white wine and cattle country. Pop. (1926) 2,218.

BAZIGARS, a nomad gipsy-folk of India, found throughout the peninsula, and variously known as Bazigars, Panchpiri, Nats, Bediyas, etc. The Bazigar is usually a Mohammedan, the Nat a Hindu. They make a living as jugglers, dancers, basket-weavers and fortune-tellers; and in true European gipsy fashion each clan has its king.

See H. A. Rose, *Tribes and Castes of the Punjab and North West Frontier* (1911).

BAZIN, RENÉ (1853–), French novelist and man of letters, was born at Angers on Dec. 26, 1853. He studied law in Paris and became professor of law in the Catholic university at Angers. His novel, *Une Tache d'encre* (1888), which received a prize from the Academy, was translated into English by Sir Arthur Quiller-Couch and P. M. Francke (1892). Other works of his are: *La Terre qui meurt* (1899, Eng. trans. *Autumn Glory*, 1901); *Les Oberlé* (1901), an Alsatian story, dramatized in 1902; *Le Blé qui lève* (1907, Eng. trans., *By Faith Alone*, 1908); *Charles de Foucauld, etc.* (1921, Eng. trans. by P. Keelan, 1923); a volume of short stories, *Le Conte du Triolet* (1924, Eng. trans. 1924); *Baltus Lorrain* (1926), and *Fils de l'Église* (1927). Bazin was admitted to the Académie Française on April 28, 1904.

BAZIRE, CLAUDE (1764–94), French revolutionist, was deputy for the Côte d'Or in the Legislative Assembly, and supported the Mountain in the Convention. He was implicated in the falsification of a decree relative to the East India Company, and though his share seems to have been simply that he did not reveal the plot, of which he knew but part, he was executed April 5 1794.

"B" BATTERY, a battery connected in the plate or anode circuit of a vacuum tube, for the purpose of supplying power to that circuit.

BDELLIUM, a name applied to several resins derived from species of *Commiphora*. The word *βδέλλιον* is used by Pliny and Dioscorides as the name of a plant exuding a fragrant gum. Bdelium is similar to true myrrh (q.v.) and is sometimes found as an adulterant of it.

BEACH, CHESTER (1881–), American sculptor, was born in San Francisco, Calif., May 23, 1881. After his preliminary education in America he went to Paris where he was a pupil of Verdet and of Roland. Returning to the United States, he settled in New York. He works with the stone, cutting from the rough and revealing his originality in ideas and his skill in modelling in powerful figures such as the bronze "Stoker" and delicate ones such as the marble "Beyond" and "Wavehead." His contrasts, "Tears" and "Laughter," two heads of infants, and "Youth and Age," the heads of a girl and of a hag, are unusually effective, as are his medallions and portraits of children. The marble portrait of his wife is in the Art Institute in Chicago.

BEACH, a word of unknown origin; probably an old dialect word meaning shingle, hence the place covered by shingle. Beach sometimes denotes material thrown up by waves, sometimes the long resulting ridge—though this generally has the special term of "storm beach"—but usually denotes the area between high and low water, or even the area between land and sea covered with material thrown up by storms.

The actual character of beach material depends upon the rocks inshore or the boulders deposited on the shore as a result of past glaciation, currents and waves. The Isle of Wight ends westward in the well-known "Needles" consisting of chalk with flints. Disintegration of this rock separates the finer chalk, carried seawards in suspension, from the hard flint, piled as rough shingle. Currents sweep constantly eastward up channel, and the rough flint shingle is rolled along toward the Ventnor rampart, and ground finer and finer, until it arrives as a very fine flinty gravel at Ventnor pier. Sandown Bay follows with cliffs composed mainly of greensand, and here the beach at low water is sandy and smooth. The eastern end of the island is again composed of chalk with flints, and here the beach material as at the western end consists of very coarse flint shingle. In this, as in similar cases, the material has been dragged seawards from the land by constant action of the undertow that accompanies each retreating tide and each returning wave. The grading of material is also excellently shown in Chesil bank where the pebbles in various sections are remarkably uniform in size and shape. The resulting accumulated ridge is battered by every storm, and thrown above ordinary high water mark in a ridge; an older example is the long grass-grown mound that has blocked the old channel of the Yar and diverted its waters into Yaverland Bay. Sandown furnishes an instructive example of the power of the eastward currents with their high-storm waves. The groins built to preserve the foreshore are piled to the top with coarse pebble and shingle on the western side, while there is a drop of over 8 ft. on to the sands east of the wall. The force of the waves has been estimated on the west coast of Scotland and found to be as much as 3 tons per square foot. Against these forces the preservation of the shore from the advance of the sea becomes an extremely difficult undertaking. The beach advances in front of the encroaching sea, burying former beaches under the sand and mud of the now deeper water, or it retreats when the sea is withdrawn from the land or the land rises locally, leaving the old shingle stranded in a "raised beach."

BEACHCOMBER, a settler on the coast of the Pacific or its islands who haunts the wharves of harbours and makes a livelihood chiefly by pilfering from ships.

BEACH PEA (*Lathyrus maritimus*), a characteristic beach plant of northern regions. It is a perennial herb of the family Leguminosae native to cool sandy shores throughout the Northern Hemisphere and extending northward to the Arctic sea. It is found on the coasts of the British Isles and on those of North America from New Jersey and Oregon northward and also in the interior along the Great Lakes. It is a smooth, stout, trailing or climbing pea-like plant, 1 ft to 3 ft high, with tendrill-bearing leaves divided into from 6 to 10 oblong, thick leaflets, and with clustered, showy, purple flowers, about 1 in long.

BEACH WORMWOOD (*Artemisia stelleriana*), a perennial plant of the family *Compositae*, native to north-eastern Asia, now naturalized in North America on sandy sea beaches from Quebec to Delaware and also on the coasts of Sweden. It is a densely white-woolly plant, with foliage very similar to that of the dusty miller (*Cineraria maritima*). It is cultivated as a border plant and enjoys some repute in household medicine. (See ARTEMISIA.)

BEACHY HEAD, promontory, Sussex, England, south-west of Eastbourne, about 3m. from centre of the town. It is a perpendicular chalk cliff 532ft high, and forms the east end of the South Downs. The old Bell Tout lighthouse, 285ft. above high-water mark, erected in 1831 on the second cliff to the westward in 0° 10' 18" E., 50° 43' 30" N., has been superseded by a new lighthouse built in the sea at the foot of the head itself.

Battle of Beachy Head.—This naval battle, known to the French as *Bévisier* (a corruption of Pevensey), was fought on June 30, 1690. An allied force of 37 British sail of the line, under command of the earl of Torrington (Arthur Herbert), and of 22 Dutch under C. Evertsen, was at anchor under the headland, while a French fleet of over 70 sail, commanded by the comte de Tourville, was anchored some miles off to the south-west, with orders to co-operate with an expected Jacobite rising in England. Torrington had suggested to the council of Regency that he ought to retire to the mouth of the Thames until he could be reinforced. The council, however, ordered him to remain and rather to fight if he could secure an advantage of position. The admiral elected to treat this as a peremptory order to fight. At day-break on the 30th he bore down on the enemy, but the numerical inferiority of the allies made it inevitable that there should be gaps between the different divisions. The English rear division under Sir Ralph Delaval, fought a close action with the French, but the French ships, ahead of the leading Dutchman, succeeded in turning to windward and putting part of Evertsen's squadron between two fires. The tide turned from flood to ebb during the action, and the surface current began to carry the fleets with it. The Dutch and English dropped anchor, but the French did not and were carried westward. When the tide turned the allies retreated to the Thames, abandoning several of the most damaged ships in Pevensey bay. Torrington was tried for his conduct but acquitted.

A full account of the battle of Beachy Head, written with ample quotation of documents, and for the purpose of vindicating Herbert, will be found in Admiral Colomb's *Naval Warfare* (London, 1899).

BEACON, a city of Dutchess county, N.Y., U.S.A., pleasantly situated on the east bank of the Hudson, opposite Newburgh, about 50m. N. of New York city. It is served by the New York Central and the Central New England railways and by river boats. The population was 10,996 in 1920, of which 2,010 were foreign-born white, and 11,621 in 1925 (State census). Its manufactures include bakers' machinery, fireworks, brick, paint, hats and tyres; the aggregate output of its 20 factories in 1925 was valued at \$6,291,012. The Matteawan State hospital for insane criminals is situated here, and at Castle Point, near by, is the U.S. Veterans' Bureau Hospital 98.

Mt. Beacon, which forms the city's background, was so named from the signal fires which were lighted on its summit in Revolutionary days. There are several historic buildings in and near the city, including the Ver Planck mansion, where the Society of the Cincinnati was organized in 1783. The first house here was built in 1709. The city was created in 1913 by the consolidation of the old villages of Fishkill Landing and Matteawan. A commission form of government (the first in the State) was provided for in its charter.

BEACON, a conspicuous object, either natural or artificial, visible as a mark from a distance by day and, if lighted (e.g., a lighthouse), at night. More particularly it is a fixed mark of distinctive construction provided to assist the mariner, by day, in identifying his position and fixing his course, or to indicate the position of hidden dangers. Beacons are essentially fixed marks as distinguished from floating marks, e.g., a marking buoy, although the superstructure usually carried by a marking buoy—such as a globe or cone—is sometimes referred to as its beacon. They are usually constructed of masonry, concrete, iron, steel or timber,

size and form varying widely with the circumstances and position. Simple and primitive forms are a cairn of rough stones, and masts of wood or iron surmounted by a cage or other appropriate top mark. In exposed wave-swept positions beacon structures must be strong and securely founded. Usually they are painted in conspicuous and distinctive colouring to increase their visibility and aid their identification by the mariner. They are erected on headlands and other positions on the coast line, small islands, isolated rocks, reefs and shoals, or to mark the limits of the fairway in harbours, estuaries and rivers. In some instances disused buildings in a conspicuous position on the coast, which otherwise might fall into ruin, have been preserved and maintained as day marks or beacons by a lighthouse authority. Beacons marking fairways are fitted with top marks of the conventional form or colour prescribed by the appropriate lighting or navigation authority in the same way as marking buoys.

A beacon sometimes carries a small light arranged to function automatically and unattended for a considerable period, and thus serves as an aid to navigation at night; such lighted beacons are often employed for fairway marking (see LIGHTHOUSE). Two beacons are sometimes so placed, at a suitable distance apart, to indicate, when seen in line, the direction of a submerged danger, or a line of fairway. If, in addition, they are lighted at night, they are described as "leading" or "direction" lights. (N. G. G.)

Beacons in Aviation.—In commercial aviation beacons or aerial lighthouses (see LIGHTHOUSE) are coming into general use for two purposes: (1) the distinctive marking of airports at night; and (2) for marking established airway routes at night.

Beacons: Airport.—Several types of beacons are used for marking airports. Powerful electric arc beacons of 300,000,000 candlepower are also used. Incandescent electric rotating beacons using 1,000-watt lamps at the focus of 24in. parabolic reflectors and having a beam candle power of 3,000,000 are most generally used for airport beacons in America. Flashing Neon beacons are being used for airport marking in several of the countries of Europe.

Beacons: Airway.—There are several types of beacons in general use for marking airway routes. The national airways of the United States are marked by 3,000,000 candlepower incandescent beacons spaced at intervals of ten miles along the route. The beacons rotate at six revolutions per minute. Smaller acetylene flashing beacons with Fresnel optical system are occasionally used where shorter spacing is desirable. On the European airways, in addition to the incandescent type and acetylene flashing type described, small Neon beacons are being used, especially in Germany. France, in addition to marker beacons along the air routes, has installed a number of very powerful location beacons on elevated points, not as markers on a route but as definite locations visible from long ranges. The Dijon beacon and the Mt. Valerian beacon are examples of this type. (E. A. Sp.)

BEACONSFIELD, BENJAMIN DISRAELI, EARL OF (1804–1881), British statesman and novelist, eldest son of Isaac D'Israeli (q.v.) and Miriam (or Maria) Basevi was born on Dec. 21, 1804, at 6 King's road, Bedford row, now 22 Theobald's road, London. His grandfather, Benjamin D'Israeli (or Israeli) had come to England in 1748 from the Italian Jewish colony of Cento in Ferrara, as a trader; by his death he had risen to be a member of the Stock Exchange committee and left an estate of £35,000. This Benjamin D'Israeli's second wife was Sarah Siprut de Gabay Villareal, descended on the one side from the great Spanish Jewish house of Ibn Xaprut, on the other from the famous Portuguese Jewish family, the Villareals. Their son, Isaac D'Israeli, student of letters and dilettante, remained until 1813 a member of the Portuguese synagogue in Bevis Marks, but in consequence of a quarrel that he had in that year with the officials of the congregation, decided to sever his connection with the religion of his forefathers, and permitted his three surviving sons and his daughter to be baptized. Benjamin's christening took place on July 31, 1817, at St. Andrew's Holborn, and by this indifferent decision of his sceptical father was made possible the political career from which, as a Jew, he would by the laws of the time have been debarred.

Benjamin Disraeli was sent to school first at a Mr. Potticany's at Blackheath and then to Higham hall, near Walthamstow, a prosperous academy kept by a Unitarian minister, the Rev. Eli Cogan. At the age of 17 he was articled to a solicitors' firm in Old Jewry, but three years' experiment convinced a young man of adventurous and romantic temperament, whose dandified dress already attracted notice, that he was not cut out to be a lawyer. His first essays in a wider field were, however, unfortunate. By gambling in South American stock in 1825 he loaded himself with heavy debts, and by attempting, with the aid of a ready tongue and a bold address, to organize, on behalf of Murray the publisher, a new daily paper, the *Representative*, of which Lockhart, Scott's son-in-law was to be editor, he involved himself in a journalistic failure and made enemies of Murray, of John Wilson Croker, the Tory publicist, and other influential persons. His fortunes took a turn for the better, however, when, at the suggestion of his friend, Mrs. Austen, a solicitor's wife, he embodied and embellished some of his experiences in the daring *roman à clef*, *Vivian Grey*, which was published by Colburn, with strenuous puffing in 1826. In spite of its youthful crudeness, the novel made a stir by its lively plot and witty dialogue, as much as by the audacity with which the chief figures of society were introduced into it under thinly disguised names. On returning to England after a tour in Italy with the Austens, Disraeli published in 1828 a satire on English life and institutions, entitled *The Voyage of Captain Popanilla*; he also entered at Lincoln's inn for the Bar, but, overtaken by illness and depression, largely in consequence of the burden of debt, passed some time in comparative idleness at his father's new country home, Bradenham manor, at the foot of the Chiltern hills. Among the subjects of his meditation at this period appear to have been the history and destiny of the Jewish race, to which he belonged, and he fretted to visit the East and the home of his people. To gain money for the journey he wrote a second society novel, *The Young Duke*, for which in 1830 he was paid £500, and thus enabled to sail from Falmouth in the summer of this year, accompanied by William Meredith, who was engaged to marry his sister Sarah.

This voyage deeply influenced Disraeli's ideas. The itinerary included Spain, Albania, Athens, Constantinople, Palestine and Egypt. Although he indulged his fantasy by wearing a belt full of pistols and daggers, "red cap, red slippers, broad blue striped jacket and trousers," his observation was keenly at work, as is shown in the letters he wrote home to his sister Sarah, the substance of which he later incorporated into his novel *Contarini Fleming*. It was the East that particularly fascinated him, alike in the Alhambra at Granada, at Constantinople, where he was enchanted by the character and life of the Turks, and at Jerusalem, where he had the daring to seek an entry into the mosque of Omar, on the site of the Jewish temple, but was "quickly surrounded by a crowd of turbaned fanatics and escaped with difficulty." In Cairo he had an interview with the great khedive, Mehemet Ali, with whom he discussed parliamentary government. Much of Disraeli's policy in later life may be traced to these experiences. His solicitude for the oriental empire of Britain, his support of Turkey against her enemies, his swift perception of the importance of the Suez canal, above all his unfailing pride in his own Jewish ancestry all owed something to his experiences during this memorable journey. After his return (which was darkened by the death of his companion Meredith from small-pox) he utilized his impressions for two books, *Alroy*, a historical novel based on the exploits of a Jewish national leader in western Asia during the 12th century under the Caliphate, and the "psychological romance" called *Contarini Fleming*. In this latter story, one of the finest of Disraeli's works, his own fiery ambitions are portrayed in the character of the hero, who is the son of a great minister in an imaginary Scandinavian kingdom and on his mother's side of Venetian descent, as Disraeli believed that he was himself. Contarini, like his creator, suffers from the conflict between his poetical and political ambitions, and also from the sense of being half an alien in the country of his birth. In none of his books has Disraeli given a clearer view of his own nature and ambitions.

In fact, the time was now at hand when he himself was to make the choice between letters and politics as the main object of his career. In 1832 he offered himself at a bye-election in High Wycombe, near his home, as a Radical candidate, supported by O'Connell, Hume and Burdett. He was twice defeated in this borough, and then, with an audacious change of front, came forward to contest a county seat as a Tory. His quick wit soon showed him that he was laying himself open to the charge of being an adventurer without principles, and when planning his next candidature in Marylebone (which never actually took shape) he issued a pamphlet "What is He?" in which he sought to show that it was possible honestly to be both a Tory and a democrat. At the moment such a contention might seem the merest opportunism, but in fact it represented one of the deepest and most lasting of Disraeli's political convictions. He was shrewd enough, however, to realize that he must, if he wished to succeed, range himself under one party banner or the other, and accordingly he drew near to the Tories attaching himself particularly to the ex-chancellor, Lord Lyndhurst, a restless and somewhat discredited intriguer. He had still a third and a fourth defeat to suffer, at Wycombe in the general election of 1834 and at Taunton in a bye-election in 1835, but during 1835 and 1836 he laid the basis of a political reputation by three brilliant polemical pamphlets, *The Rummymede Letters* in *The Times*, attacking Melbourne's Whig Government with bitter sarcasm, and two constitutional tracts entitled *A Vindication of the English Constitution* and *The Spirit of Whiggism*. These writings, in spite of their extravagance of phrase and their exotic flavour, expose a coherent philosophy of Conservatism. The theories of abstract rights and the *a priori* systems of the utilitarians are disputed in favour of an organic view of society and of national growth. National character is fashioned by history and institutions and to destroy a nation's institutions is to destroy its life. The House of Commons is not the "house of the people"; it is the house of an "estate" of the realm, that is to say of a particular section of the nation who have the privilege of representation in it. Civil liberty and equality, which make England essentially democratic, are only to be preserved by maintaining the balance of our institutions as a whole, and it is the Whigs who have always been the really anti-popular party by endeavouring to maintain the supremacy of a class on the ruins of those popular bulwarks, the monarchy and the Church. The Tories, in appearance the champions of royal and ecclesiastical absolutism, have really been the champions of national liberty against a veiled oligarchy. Toryism does not proscribe the enlargement of the "third estate" by prudent extensions of the franchise; it only objects to the "sectarian" character of the Reform Act which the Whigs carried in 1832 with a view to consolidating their own political strength. Besides throwing into literary shape these theories which in substance guided the whole of his career as a British statesman, Disraeli in these waiting years published a Lucianic volume of satires including *Ixion in Heaven* and the *Infernal Marriage*, and two more novels, the love story, *Henrietta Temple* (1836) and *Venetia* (1837), which presents some of the chief episodes from the lives of Byron and Shelley in the form of fiction. The year of the publication of *Venetia* was that of the death of William IV and the accession of Queen Victoria. A new reign then meant a dissolution of Parliament, and Disraeli at last gained a seat as Conservative member for Maidstone.

It is well known that his maiden speech on an Irish topic in the House of Commons on Dec. 7, 1837, was a failure. The extravagance of his attire (more suited to the company of his friends, the dandies, D'Orsay and Bulwer, or to the dining-table of the "gorgeous" Lady Blessington than to Parliament) and the exuberant similes with which his speech was bejewelled made an impression of affected absurdity and he was laughed down, but not before he had warned his interrupters that one day they would have to listen to him. He quickly set himself to learn the style of the House and began to claim attention both by his command of facts and figures and by his independence. This he showed especially in the debates on the Chartist petition and disturbances in 1840, which proved that his desire to improve the conditions of the working-class was no mere affectation of Radicalism. While he

was thus strengthening his parliamentary position, he had also improved his social status by his marriage in 1839 to Mrs. Wyndham Lewis (born Mary Anne Evans), the widow of his fellow Conservative Member for Maidstone, who had lately died. Mrs. Disraeli brought to her husband, who was 12 years her junior, a house in Park Lane, a considerable fortune and the unceasing devotion of an affectionate, but not particularly intellectual, nature.

Fortified by these advantages, Disraeli considered himself important enough to solicit from Sir Robert Peel, the Conservative leader, a place in the Government that he formed on the fall of Melbourne's Whig administration in 1841. Peel's reply was a curt refusal prompted, it is believed, by a member of his cabinet, Lord Stanley, and the rejected applicant thus entered the new Parliament (where he was returned for Shrewsbury) in a mood of discontent with his leader which gave edge to a divergence of political ideals that must in any case have led to a breach. Peel's Conservatism was of a prudent and conciliatory type, which aimed especially at securing the support of the wealthy manufacturing middle-class that had risen to power by the industrial revolution. Disraeli's Toryism was more romantic and literary, at once more aristocratic and more popular. He believed strongly in the power of the Crown, in the preponderance of the old landed aristocracy, in the influence of the Church (which was at this date being championed with a new fervour by the Oxford Tractarians) and in the need of protecting the labouring class from exploitation by the factory system. These were the ideals that inspired also the small group of youthful Tories (numbering in their ranks George Smythe, later Lord Strangford, Lord John Manners, afterwards Duke of Rutland, and Ambrose Phillips de Lisle, a Roman Catholic gentleman with large estates) who acquired the nickname of "Young England." Under Disraeli's leadership this band of enthusiasts began to harass Peel with criticisms and sarcasms in the House; and to give publicity to their aims Disraeli wrote and published in 1844 *Coningsby, or the Younger Generation*, the first of a projected series of three political novels and one of his most powerful books, which has given to English literature such celebrated characters as Lord Monmouth (based, like Thackeray's Lord Steyne on the actual Lord Hertford), Mr Rigby, a bitter satire on John Wilson Croker, Taper and Tadpole, the electioneering jackals, and the mysterious Jewish millionaire, Sionia, embodying many of Disraeli's own characteristics of mind and temper. The next year appeared the second volume of the trilogy, *Sybil or the Two Nations*, which is a moving and carefully documented picture of the Chartist movement and of the distressful condition of the working classes in the "hungry forties." To deliver the lower of the two "nations" (the poor) from the oppression of the upper (the rich), Disraeli looked to the crown without specifying clearly how the young queen could intervene. The book gave added weight to the attacks of the author and his disciples on Peel's factory legislation, for falling short of the drastic reforms of hours and conditions of labour demanded by the Tory reformer, Lord Ashley (afterwards Lord Shaftesbury). It was becoming increasingly clear both to Disraeli and to the landed gentry who formed the bulk of the Tory party that Peel in his regard for the great mill-owners and for the expansion of British industry was approximating more and more to the ideals of the Liberal opposition, that, as Disraeli phrased it, he had "caught the Whigs bating and walked away with their clothes." The conflict was now to come to a sharp issue on the crucial question of the corn laws.

Ever since the foundation of the Anti-corn-law league in 1838 by Cobden and Bright the protective duties on foreign corn, which had been left in an invidious prominence by Huskisson's sweeping reduction of tariffs in 1825, had been the object of fierce attack by the manufacturing middle-class. Peel, who had been called to office after defeating the Whigs on a proposal to reduce protective duties, was nominally the champion of this bulwark of the landed interest, but his sympathies and his intellectual convictions were being more and more captivated by the theories of the free traders, a fact which became so obvious that in the beginning of the session of 1845 Disraeli amid applause declared that "a Conservative Government is an organized hypocrisy." In the autumn

of the same year a ruinous harvest, coinciding with the outbreak of the potato disease in Ireland hastened Peel's decision. He urged upon his cabinet the necessity of repealing the corn laws, and since they hesitated, Peel, feeling his hand to be forced by Lord John Russell's Edinburgh letter of Nov. 27 announcing his own conversion to complete free trade, handed in his resignation to the queen. Russell failed to form a Liberal Government through dissensions in his own party and Peel returned to office in Jan. 1846 with a reconstructed cabinet, from which the principal seceder was Lord Stanley, the brilliant minister for the colonies, Disraeli's former enemy. Peel at once introduced proposals for abrogating the corn laws, and in the bitter struggle which filled the session between Peel with his followers and the protectionist Tories, Disraeli and a sporting nobleman, Lord George Bentinck, led the opposition. The force of invective with which Disraeli assailed the prime minister during this session made him the leading orator of the House of Commons and an indisputable chief of the old Tory party. A painful incident of the duel between Peel and his revolted follower was Disraeli's denial, in answer to a taunt from the minister, that he had ever solicited office from him, which has been variously interpreted as a lapse of memory or a deliberate falsehood. The protectionists did not succeed in staying the repeal of the corn laws, which was finally carried on June 25, 1846, but they succeeded on the same night in turning out the prime minister by voting against him (with scant consistency) on a proposed measure of coercion for Ireland. The Conservative party was now irretrievably split, and a period of reconstruction in opposition awaited them.

The years of Liberal Government between 1846 and 1852 were spent by Disraeli in attempts to extricate his party from the eclipse into which it had fallen. The death of Peel from a riding accident in 1850, and of Bentinck from heart failure in 1848, cleared the political stage. In spite of the lingering dislike still felt for him by Stanley, the leader of the protectionists in the Lords, Disraeli, who from 1847 to the end of his career in the Commons sat as member for the county of Buckingham, became by degrees the acknowledged leader of the party in the Commons, though he remained unpopular with sections of his following for two main reasons. One was the racial pride with which he emphasized his Jewish descent. This was shown by the support he gave Russell against his own party in 1847 in removing the barriers that excluded professing Jews from Parliament, and even more by the publication in the same year of the third volume of the political trilogy, *Tancred or the New Crusade*. This volume had been planned to deal with the Church, but in fact it implies the impotence of the Church and the emptiness of English politics generally, which leads the hero, a wealthy young noble, to visit Jerusalem and wander in the holy land seeking inspiration from "the angel of Arabia," that is, from the genius of the Semitic stock. The second cause of the distrust felt for Disraeli at this epoch was his determination to bury the issue of protection and to rally the Conservatives round some fresh programme. The completion in 1851 of his vivacious biography of Lord George Bentinck was in effect his final tribute to what he had come to hold an irreparably lost cause. His private life during these waiting years was marked by the purchase in 1848 of the picturesque estate of Hughenden in Buckinghamshire and by his romantic friendship with Mrs. Brydges Willyams, an aged Jewess of Torquay, who left him her considerable fortune on her death in 1863, and was buried in his family grave at Hughenden.

The time of waiting ended in 1852, when the destruction of Russell's Government through his feud with Palmerston placed Stanley (who had in 1851 succeeded to the title of Earl of Derby) for a brief while in office. It was an insecure ministry, since neither Palmerston nor William Ewart Gladstone, the chief figure among the so-called "Peelites," could be persuaded to join it, and in a House overwhelmingly free trade in conviction Disraeli, as chancellor of the exchequer, had an insuperably difficult task. The budget that he brought forward in December, 1852, designed to relieve the agricultural interest by other means than a reversion to protection, was fiercely attacked both by Gladstone and by the Whigs and brought about the fall of the ministry. During Aber-

deen's coalition Government that followed, with the sequel of the Crimean War, Disraeli was principally occupied with organizing and conducting *The Press*, a weekly paper that criticized the hesitations and inefficiency of the ministry with savage irony. Derby would have been the natural person to take office when the coalition split in 1855 amid the disasters of the Crimean expedition, but he shirked the task and it was not until 1858, when Palmerston, the successor of Aberdeen's luckless combination, was overthrown over the Conspiracy bill which he promoted after Orsini's attempt (planned in England) to murder Napoleon III., that the Derbyite party found itself once again in office. Although Disraeli wrote a most magnanimous letter to Gladstone, hinting that he might himself be willing to "be removed from the scene," Gladstone still refused to return to the Conservative fold. The main problem with which the ministry found itself faced was that of parliamentary reform. It was widely felt that the time had come to enlarge the franchise which the Act of 1832 had extended to the middle classes so as to take in the best elements at least of the working class. Disraeli brought forward a tentative Bill in Feb. 1859, which lowered the qualification for the county franchise (an advantage to the Conservatives) and attempted to give some actuality to Disraeli's old dream of "estates of the realm" by what came to be known as the "fancy franchises," votes given to certain professions and standings, as those of the clergy, lawyers, schoolmasters, investors in savings banks and so on. It was too timid to please, and the overthrow of the Government soon followed. Palmerston, resuming in June, 1859, the premiership which he held until his death in 1865, systematically damped down all attempts to fan the flame of reforming zeal. Gladstone, however, who had been a Liberal minister since the overthrow of the Conservatives in 1859, was determined to advance in this direction (after Palmerston's death) and to enfranchise the masses. As leader of the House of Commons under Russell's premiership, he brought forward in 1866 a Reform bill that was hotly opposed not only by the Conservatives but by a revolted section of his own followers headed by Robert Lowe, who saw in it a surrender to pure democracy. The Liberal Government fell with its bill in the summer, and left to the new cabinet formed by Derby the duty of dealing with the reform question, now rendered more pressing than ever by John Bright's inflammatory oratory, the riots in Hyde Park, and the insistence of the queen on the necessity of allaying the agitation. After much cautious feeling of the way the cabinet in Feb. 1867 agreed on a plan of which the main features were household suffrage for all personal ratepayers, a second vote for those who paid also 20s in direct taxation and certain fancy franchises. But the bold advance made by such a scheme in the direction of democracy produced an abrupt crisis in the cabinet. During the weekend of Feb. 23-Feb. 25, Lord Cranborne (Robert Cecil), the Indian secretary, and one of the strongest men in the Government, convinced himself by a fresh study of the statistics that the new Bill would go further than its promoters realized in throwing the balance of power in the constituencies into the hands of the new popular voters. He won over to his view Lord Carnarvon, the colonial secretary, and General Peel, the war minister, and on Monday morning, the very day upon which Disraeli was to unfold the bill to the House, the dissentients announced to Derby that they withdrew their support from the measure. As a result of this unexpected blow Disraeli had to confront the House with some lame suggestions, derisively known as the "ten minutes" bill. But in a few weeks, Derby and Disraeli, rallying from the shock, resolved to return to their original project, at the cost of losing Cranborne and his two sympathizers. Accordingly, Disraeli on March 18, brought in a bill on the lines already mentioned. In its first draft it was not extreme, since the grant of household franchise in the boroughs to ratepayers (which accompanied a reduction on the qualification for the county franchise) was balanced by the dual vote, the fancy franchises and the exclusion of the "compound householder," i.e., the householder, usually poor, who compounded with his landlord for the latter to pay his rates. But in the course of the debates Disraeli with astute parliamentary skill yielded to critics of the measure on all these vital points without forfeiting the prestige of the Government. He agreed to

lower the county franchise still further, to a £12 basis, to abandon the dual vote and the two years residence qualification, to include lodgers, and finally to abolish the system of compounding for rates, which made the "fancy franchises" otiose and enormously increased the mass of voters. The bill was finally passed on Aug. 15, after bitter opposition from Gladstone (who was, however, abandoned by his own party), Lowe and Lord Cranborne, who denounced the "Conservative surrender." Undoubtedly Disraeli had departed far from his theory of balanced "estates" and his often repeated hostility to a democracy of numbers, while Derby confessed to "a leap in the dark." They could, however, plead something like a national mandate to settle the reform question on broad lines in order to avert revolution, while the extended electorate of their creation proved by no means unfriendly to Conservative principles.

Its gratitude, however, was not immediate. Disraeli (who became prime minister on Derby's retirement in Feb. 1868) was overthrown, when Gladstone (who had become formal leader of the Liberal Party by old Lord Russell's retirement in 1867) brought forward in 1868 his project for disestablishing the Irish Church. The electorate supported the Liberals and from the autumn of 1868 to 1874 Disraeli was again condemned to hold together a party languishing in the chill of opposition. He had been overthrown on a Church question and religious interests filled a great part of his mind at this period. He had endeavoured, while prime minister, to distribute Church patronage so as to discourage both the Ritualist (Anglo-Catholic) and Broad Church parties, and in a famous speech delivered at Oxford in 1864 he had criticized rationalism and Darwinism, declaring himself "on the side of the angels" against those who (he said) favoured the view that man was rather an ape. He now gathered up the results of his religious thinking in *Lothair*, the most successful of his novels, published in 1870, which depicts the struggle of the revolutionary sects against the papacy, the progress of Roman Catholic proselytizing in England, the conflict between Semitic and Hellenic ideals and other burning topics of the hour in the form of a good-natured satire on English society. His home life was darkened in 1872 by the death of his devoted wife, for whom on leaving office four years earlier he had secured the title of Viscountess Beaconsfield; but he found some solace in his Platonic but ardent affection for Lady Bradford, for whom, as for her sister, Lady Chesterfield, he unceasingly declared the warmest sentiments in his letters. Politically he had little to do but to watch Gladstone's administration break up under the strain of its own mistakes, though he plied it with keen criticisms, and in especial urged the need of maintaining imperial cohesion against what he considered the "cosmopolitan" indifference of the Liberal rulers to England's colonial heritage. His patience and tenacity were rewarded, when, after the crushing defeat of Gladstone in 1874, he returned to power with a large majority and was able to form an exceptionally strong Government in which Lord Salisbury (formerly Lord Cranborne), now at length reconciled, accepted the India Office again, while Lord Derby (Edward Stanley), the son of Disraeli's old chief, became foreign secretary, Lord Carnarvon, colonial secretary, and a powerful lawyer, Sir Hugh Cairns, lord chancellor.

Yet a further source of strength to the new ministry lay in the special sympathy felt by Queen Victoria for its chief. At the outset of his political career Disraeli had been regarded with some distrust both by the queen and the prince consort; but a better understanding of his ability, his patriotism and his sincere devotion to the monarchical idea had worked a change in the views of the royal couple. After her husband's death, Queen Victoria found great support in the courtly deference and loyal affection with which Disraeli treated her; and though it is difficult to clear him from the charge of gaining certain ends by flattering her self-esteem, there is no reason to doubt either his faith in the principle of monarchy or that his romantic temperament sincerely responded to the ideal of devotion embodied in her whom he called (following Spenser) the "faery." He had not been long in office before he conferred a fresh lustre on her crown by securing the addition of the title "empress of India" to her royal and imperial style. This imaginative measure, carried in 1876, had the

further effect, which Disraeli with his oriental sympathies clearly foresaw, of binding the princes and peoples of India by a closer, more personal tie of loyalty, to the English rule.

Queen Victoria, perhaps, valued almost as highly the support which her prime minister gave her in promoting the passage into law of the Public Worship Regulation Act of 1874. This bill, proposed by the archbishop of Canterbury, Dr. Tait, had for its object to restrain the alleged illegalities of ceremonial practised by the Anglo-Catholic party in the Anglican Church; in Disraeli's picturesque phrases it aimed at "putting down ritualism" and abolishing "the mass in masquerade." An untoward incident of the debates on the measure was a bitter interchange between the prime minister and Lord Salisbury (a moderate High Churchman), who opposed the bill and was described by his chief as "a great master of gibes and flouts and jeers." The remark, however, did not lead to a breach with his powerful lieutenant, and the vehement Protestantism of the queen was gratified by Disraeli's remark that the success of the bill had been wholly due to "the personal will of the sovereign."

That "personal will" was not less strongly felt in the principal matter with which Disraeli's last and greatest administration had to deal, the Eastern question (*q.v.*). Ever since his youthful tour in the East, he had taken a specially keen interest in that department of politics and the concern for Britain's Indian empire which had spurred him on to give the queen her new title made him vigilantly jealous of all possible encroachments on British supremacy in the East. In 1875 a unique opportunity occurred for gaining possession of one of the chief doorways to the orient. The khedive of Egypt found himself compelled by his heavy debts to offer for sale his 177,000 shares in the Suez canal. Disraeli, on receiving early news that the shares were to be disposed of, promptly borrowed the four millions needed from the Rothschilds in the name of the cabinet and waited for parliament to sanction his audacious stroke. It may be reckoned the greatest service that in his long career he rendered to his country.

More complicated was the trouble that arose in 1876 in the Balkan peninsula. Following Palmerston and the great diplomatist Lord Stratford de Redcliffe, who had directed the policy that culminated in the Crimean War, Disraeli was deeply convinced that only by maintaining the Turkish empire with its centre at Constantinople could Russia be prevented from obtaining a position at the Straits from whence ultimately she would threaten British dominion over India and elsewhere in the East. The Bulgarian revolt of 1876, however, suppressed by the Turkish government with hideous barbarity, seemed to give Russia only too plausible an excuse for interfering in the Near East in the interest of humanity. Disraeli made an initial blunder when he dismissed the news of the atrocities committed by the Turkish troops in Bulgaria as "coffee-house babble," and the apparent callousness of his attitude enabled his opponent Gladstone (who had temporarily retired from the leadership but not from the fighting ranks of Liberalism) to mobilize an immense weight of public opinion against him by vigorous pamphlets and by speeches demanding the expulsion of the Turkish government "bag and baggage" from Europe. Disraeli was not shifted from his position by the outcry, and as the situation became more entangled by Montenegro and Serbia declaring war on the Sultan and by Russia peremptorily demanding an armistice, he delivered at the Lord Mayor's banquet in November a defiant speech on England's readiness for war. This seemed doubly unfortunate since shortly before a conference of representatives of the Powers had been convoked at Constantinople, with Lord Salisbury representing England. Although Salisbury reached a friendly agreement with Ignatiev, the Russian representative, and a plan for reorganizing the government of the Sultan's Balkan possessions was accepted by the conference, the upshot was a failure, through the obduracy of the Turkish Government, who considered that the attitude openly displayed by the British Minister and more cautiously shown by the foreign minister, Lord Derby, justified them in believing that the failure of the negotiations would not displease the British Government. In pursuing this line Disraeli (who had in the summer of 1876 gone to the House of Lords with the title earl of Beaconsfield) had the

energetic support of the queen, who dreaded the spectre of Russian aggression in the Near East and was revolted by the extravagant agitation of the Liberals and High Churchmen in favour of the Balkan Christian States.

The result of the failure of the conference was the outbreak of war between Russia and Turkey in the summer of 1877, and Disraeli was now faced with the triple task of maintaining a threatening front against a possible Russian advance upon Constantinople, preserving the unity of his cabinet (in which Salisbury and Carnarvon by no means shared his enthusiastically pro-Turkish convictions, while Derby grew progressively more and more alarmed at the possibility of England being involved in the war), and restraining the ardour of the queen, who was passionately desirous of throwing down the gauntlet to Russia. When after sharp vicissitudes of success and failure, the Russian armies in December captured Plevna, which had heroically resisted their advance, and appeared on the outskirts of Constantinople, Disraeli, still hotly pressed by the queen who even spoke of abdication, began to concert measures of warlike preparation and a schism in the Cabinet became inevitable. Carnarvon was the first to go, and when on Feb. 8, 1878, the English fleet was sent up to Constantinople, and on March 27 the cabinet decided to call up the reserves and to seize a military post such as Cyprus or Alexandria from which to control the eastern Mediterranean, Derby also resigned his position. Fortunately for Beaconsfield, Salisbury was indisposed to tolerate the demands made upon the Sultan by Russia in the Treaty of San Stefano, dictated, as it were on the field of victory. It provided for an autonomous Bulgaria with far-reaching frontiers, the entire independence of Rumania, Serbia and Montenegro, the cession of Kars and Batum to Russia and the payment of a war indemnity by the vanquished Turks. Salisbury agreed to take Derby's place at the Foreign Office and promptly issued a circular to the Governments of Europe demanding that Russia should submit the Treaty in all its parts to a congress. Russia was in no position to refuse, but before the congress met at Berlin and while Disraeli was summoning Indian troops to Malta a secret agreement between England and herself conceded the division of Bulgaria into two parts, the Southern enjoying less independence than the Northern and the retention by Russia of Kars and Batum subject to England finding compensation in another quarter, which was effected by requiring Turkey to cede Cyprus in return for a guarantee of her Asiatic possessions. This arrangement naturally robbed the congress which opened on June 13 of much of its actuality. Beaconsfield and Salisbury represented Great Britain, and the "old Jew" greatly impressed Bismarck by his firmness. At one moment when the Russian representatives seemed inclined to waver on the new arrangements about Bulgaria, he ordered his special train to be got ready for his departure from Berlin. The influence of Bismarck and of Austria-Hungary, which had been placated by receiving the right to administer Bosnia and Hercegovina, ultimately induced Russia to yield to the chief English demands; a Treaty in that sense was signed on July 13 and Beaconsfield and Salisbury returned to England in triumph, the former claiming to have brought with him "peace with honour."

It was his last triumph. Misfortune gathered round the last months of his Government. Both in South Africa, where the Zulus massacred an English force at Isandhlwana and in Afghanistan, where the British Resident at Cabul was murdered by his staff, it seemed that Conservative policy was rash and ill-judged. The efforts made by the able home secretary, Richard Cross, to improve artisans' dwellings and public health (a legacy of the ideas expressed in *Sybil*) did less to strengthen Conservatism than the acute agricultural depression did to destroy its popularity. A shattering defeat was encountered at the polls in 1880 and Beaconsfield did not tarry in resigning. He took up again a novel he had left unfinished when called to office, and produced in *Endymion*, which was published towards the end of the year, a political novel that was rather a romantic retrospect of the years he had known, than the enunciation of a programme or of a set of principles. In March 1881 Beaconsfield was attacked by a chill, which proved fatal on April 19. He was buried in the family

vault at Hughenden between Lady Beaconsfield and Mrs. Brydges Willyams, and a few days after the interment Queen Victoria came herself to lay a wreath with her own hand upon the grave of her favourite minister.

The character and achievements of Benjamin Disraeli have been variously estimated. As a novelist, for all his wit and his moments of acute realism, he was too individual and fantastic to be classed with a school or to perpetuate a tradition. In considering him as a statesman few would be found to deny that by his courageous seizure of opportunity in the matter of the Suez canal shares he did more to consolidate British power in the east than has fallen to most statesmen to do at a single stroke. Only prejudice again could refuse him the credit of having by tenacity and astuteness reconstructed the Conservative party, shattered by Peel's face-about on the corn law question, and incapable of being restored to its old strength by Derby's dilettante and capricious leadership. Disraeli not only held Conservatism together; he secured for it a new lease of prosperity by making it a popular rather than a restrictive cause. It has on the other side been urged that many or most of his peculiar ideas proved impracticable or sterile. His championship of protection and the preponderance of the landed class, his theory of "estates of the realm" as an alternative to democratic parliamentarism, his faith in the recovery of personal power by the crown, his desire to draw the cords of empire closer by a tariff, a military code and a continuous council representing the Dominions in London, his ecclesiastical policy of warring on both the latitudinarian and Catholic elements of Anglicanism, all proved designs that were either abandoned by their author or failed to commend themselves to posterity. Nor was his Near Eastern policy, on which he especially plumed himself, anything but a grandiose failure. The division of Bulgaria, with the whole scheme of maintaining Turkish rule in the Balkan peninsula, has passed like a dream, while the establishment of the Hapsburg monarchy in Bosnia and Hercegovina paved the way for the conflagration of 1914. In spite of these considerations, however, Conservatives are loth to admit that Disraeli left no legacy beyond the sentimental tradition that founded the "Primrose League" on one of his alleged floral preferences. They feel that they have inherited from him a spirit if not a set of dogmas. The union of Toryism with democracy, the acceptance of the duty of social reform, pride in the empire apart from considerations of material profit, the veneration of the crown as the sacramental symbol of national and imperial unity, are all principles that the modern Conservative finds expressed with incomparable force and felicity in the speeches, novels and epigrams of this undoubtedly mysterious personality.

To solve that fascinating mystery many attempts have been made. Disraeli's personal integrity is no longer doubted. His zeal for his party and his country makes it inappropriate to call him an "adventurer," however adventurous on many occasions his policy. Yet he continues to baffle critics. Few have been more successful in summarizing his character than Frederick Greenwood in the memoir that appeared in earlier editions of this *Encyclopædia*, part of which may fitly be quoted here:—"He was thoroughly and unchangeably a Jew. At but one remove by birth from southern Europe and the East, he was an Englishman in nothing but his devotion to England and his solicitude for her honour and prosperity. It was not wholly by volition and design that his mind was strange to others and worked in absolute detachment. He had 'none of the hereditary prepossessions of the native Englishman.' No such prepossessions disturbed his vision when it was bent upon the rising problems of the time, or rested on the machinery of government and the kind of men who worked it and their ways of working. The advantages of Sidonia's intellect and temperament were largely his, in affairs, but not without their drawbacks. His pride in his knowledge of the English character was the pride of a student; and we may doubt if it ever occurred to him that there would have been less pride but more knowledge had he been an Englishman. It is certain that in shrouding his own character he checked the communication of others to himself, and so could continue to the end of his career the costly mistake of being theatrical in England."

BEACONSFIELD, urban district, South Buckinghamshire, England. Pop. (1921) 3,642. It lies just off the chalk of the Chilterns, in a hilly district above the valley of the small River Wye, a tributary of the Thames, giving access to High Wycombe and thus to North Bucks and Oxfordshire. It grew as a posting station of some importance, and has revived its function as a route town with modern road traffic. The Oxford road forms its main street. The improvement of railway communication with London in 1906 led to an influx of resident population. (The population in 1901 was 1,570.) The Perpendicular church of St. Mary and All Saints is the burial place of Edmund Burke (d. 1797) who lived at Butler's Court, near the town. Benjamin Disraeli chose the title of Earl of Beaconsfield in 1876. There was formerly a considerable manufacture of ribbons. Since 1918 the town has formed part of the Aylesbury parliamentary county division.

BEACONSFIELD, a town in South Africa. It is situated at an elevation of 3,790ft. Pop. (1918) 3,445 whites, 16,919 natives and coloured. The town was founded in 1870 near the famous Du Toit's Pan diamond mine. It gradually became practically a suburb of Kimberley, and was officially united to that municipality in 1912.

BEACONSFIELD, a town of Devon county, Tasmania, on the river Tamar. Pop. c. 3,000. It is the centre of the most important gold-field in the island.

BEADLE, also **BEDEL** or **BEDELL**, originally a subordinate officer of a court or deliberative assembly, who summoned persons to appear and answer charges against them (see Du Cange, *supra tit. Bedelli*). As such, the beadle goes back to early Teutonic times; he was probably attached to the moot as its messenger or summoner, being under the direction of the reeve or constable of the leet. After the Norman Conquest, the beadle seems to have diminished in importance, becoming merely the crier in the manor and forest courts, and sometimes executing processes. He was also employed as the messenger of the parish, and thus became, to a certain extent, an ecclesiastical officer, but in reality acted more as a constable by keeping order in the church and churchyard during service. He also attended upon the clergy, the churchwardens and the vestry. He was appointed by the parishioners in vestry, and his wages were payable out of the church rate. From the Poor Law Act of 1601 till the Act of 1834 by which poor-law administration was transferred to guardians, the beadle in England was an officer of much importance in his capacity of agent for the overseers. In all mediæval universities the bedel was an officer who exercised various executive and spectacular functions (H. Rashdall, *Hist. of Universities in the Middle Ages*, i. 193). He still survives in many universities on the continent of Europe and in those of Oxford and Cambridge, but he is now shorn of much of his importance.

BEAD MANUFACTURE. A bead is a small globule or ball used in necklaces, etc., and made of a great variety of materials.

Beads have been made from remote antiquity, and are found in early Egyptian tombs; variegated glass beads, found in the ground in certain parts of Africa, as Ashantiland, and highly prized by the natives as *aggry*-beads, are supposed to be of Egyptian or Phœnician origin. Glass beads have long been used for purposes of barter with savage tribes.

Czechoslovakia produces by far the largest proportion of the world's beads, and though the variety from that country alone is immense, the principal material employed is glass. From Venice come the Venetian beads that are ornamented in bright colours, the colouring matter being blown on by means of a tube. Carved ivory and bone beads come from China and Japan; porcelain beads

from France, Germany and Austria; jug beads from Bavaria. Then there are loofa beads, noteworthy for their extremely light weight, mosaic beads and pound beads, so called because, being so very small, they are sold by the pound weight.

In glass beads there are two distinct methods of colouring. The cheaper kinds are dyed on the outer surface, while the better are coloured on the interior surface. Variegated effects are sometimes introduced by mixing a number of colours while the material of which the bead is made is in a hot and plastic form. Different finishes are identified by the application of trade terms, as, for example, the "satin" bead, which has a dull lustre.

The bead trade is essentially a fashion trade, and therefore fluctuates considerably from year to year, this applying both to beads used for necklaces and for the trimming of dresses. Cylindrical beads for the latter purpose are often known as "bugles."

The Gablonz Industry.—The centre of the Czechoslovak bead industry is in the district of Gablonz, the exports of which amount to about half of the extensive artificial jewellery production of that area. At one time the industry consisted primarily in the production of celluloid beads imitating sea corals in form and colour, but in modern times glass, wood, galalith, horn and tortoiseshell are employed. With the glass beads the raw material, either crystal or black or in various natural colours, such as topaz, aquamarine, amber, ruby, garnet, etc., is produced in the form of glass rods of about a yard in length, this work either being done on factory scale in glass works or at home by members of families. A special kind of the raw material is called "rocaïl," which is produced from a heavy lead glass. In Gablonz there are about 20 firms manufacturing beads, and production is also carried on in neighbouring places. The industry suffered severely during the World War, but on the cessation of hostilities quickly re-established itself, and in a short space of time the number of exporters rose from about 200 to 700. (G. J. W.)

BEAD-MOULDING, in architecture, a small moulding having a convex profile usually semi-circular. It is differentiated from the *torus* (*q v.*), whose profile is similar, only by its smaller size. It is sometimes decorated by breaking its surface with rhythmic alternations of long, narrow, oval forms and short, reel-shaped or wheel-shaped forms, and is then known as the bead and reel. It is also sometimes decorated by a helical incision forming it into a rope or cable moulding (*q v.*) or by carving it into a series of adjacent hemispheres. Its most common use is either above or below a larger moulding, or as part of a necking or horizontal division.

BEADS. The word bead is derived from the Saxon verb "bid-dan," to pray; originally associated with the "beads" on a rosary, it has now been extended to mean almost any pierced object which can be strung. Their great diversity of form, portability and lasting power make beads one of the most valuable articles for tracing the influence of nation upon nation even back to the times of which no written records exist.

Stone Age Beads.—The earliest objects supposed to be beads are certain small fossils, *Coscinopora globularis*, found in numbers in graduated sizes amongst the Acheulian remains. These have natural holes through them, but in some cases the holes appear to have been enlarged by hand, and the ends show signs of wear. By the Aurignacian period there is no doubt that beads were worn in large quantities, and in the carving of the "Femme au Renne" (Lagerie-Basse, Dordogne), the woman, although otherwise nude, wears a bead necklace. Amongst the beads of this period, which are made of teeth, shell, bone and ivory, is a chamois tooth with two perforations (fig. 1, 1) which appears to have been a spacing bead, and suggests that the necklaces with several strings separated by spacing beads, so common in the bronze age, were in use at this period. In the neolithic and later periods the wearing of beads appears to have been universal in all parts of the world. Such trouble was taken to make many of them that they were probably used more as amulets than as ornaments. In Egypt the word for them was "Sha-sha," the syllable "Sha" being the Egyptian word for luck.

Mesopotamia.—(See ASSYRIA AND BABYLONIA.) Discoveries at Ur show that about 3500 B.C. the Mesopotamians had a more

FIG. 1.—TYPES OF BEADS IN USE FROM 3500 B.C. TO 700 B.C.

1. Chamois tooth spacing, Aurignacian period, France. Length, .72 inch
2. Bicone cornelian, Ur, Mesopotamia, 3500 B.C. Length, 2.5 inches
3. Octagonal barrel lapis, Ur, Mesopotamia, 3500 B.C. Length, 1.35 inch
4. Lapis melon, Ur, Mesopotamia, 3500 B.C. Diameter, 1.1 inch
5. Gold bead representing a bird on fruit, Ur, Mesopotamia, 3500 B.C. Length, .38 inches
6. Etched cornelian, Ur, Mesopotamia, 3100 B.C. Length, .44 inch
7. Etched cornelian, Ur, Mesopotamia, date unknown. Length, .52 inch
8. Looset spacing in cornelian, Egypt, XIIth dynasty. Length, .5 inch
9. Daisy spacing Tel el Amarna, Egypt, XVIIIth dynasty. Length, .8 inch
10. Date pendant Tel el Amarna, Egypt, XVIIIth dynasty. Length, .7 inch
11. Faience orumb, Egypt, VIIth dynasty. Length, .5 inch
12. Onyx cats eye, Assyria, before 700 B.C. Length, .76 inch
13. Simple spot glass eye, Tel el Amarna, Egypt, XVIIIth dynasty. Diameter, .55 inch
14. Impressed ring eye, Mediterranean area, c. 800 B.C. Diameter, .65 inch

advanced culture of beads than any other country we know of at that period. Beads were made of pearl, lapis, cornelian, other stones, shell, ostrich shell and occasionally faience. Many of the stones had definite amuletic properties. Very well made bicone

cornelian beads (fig. 1, 2), octagonal barrel beads (fig. 1, 3), and lapis melon beads (fig. 1, 4), were interspersed with elaborate gold beads (fig. 1, 5) and pendants, and mixed with minute carved beads some not much more than 1mm. in diameter with a perforation of $\frac{1}{2}$ mm. The etching of cornelian and chalcedony was employed at this period. In one method the pattern was made by etching white lines on a red background (fig. 1, 6). In another the whole surface was first etched white and then dark lines re-etched on that (fig. 1, 7). This process is found in the contemporary Indo-Sumerian beads from Mohenjo-Daro on the Indus (see *INDIA: Archaeology*), where other beads also suggest a connection between the two countries; it is practically unknown in Egypt, but it has been later used in the Crimea and other parts of Russia.

Many of the Mesopotamian beads of various periods have elliptical, lenticular or planoconvex transverse sections. These shapes are also found to a smaller extent in pre-dynastic Egypt but are comparatively rare there in dynastic times. Glazed quartz beads are found from an early date up to about 2000 B.C.; they are usually colourless.

Egypt.—(See *EGYPT: Archaeology*) The earliest Egyptian beads are the Badarian which are mostly of stone. Amongst them is a large number of glazed steatite beads. The glaze used is practically glass, but glass beads are not found until much later.

In the pre-dynastic period "Faience" beads appeared, and were extensively used down to recent times. They have a core consisting of quartz fragments cemented together by heat with a small admixture of lime. This core is covered with glaze. The blue colouring matter was copper, the purple and black was manganese. Special faience beads which appear in early dynasties reach a high state of perfection both in colour and shape during the 12th dynasty, which marked the zenith of Egyptian beads. A typical bead was the ball amethyst, found in great numbers during the 12th dynasty but uncommon at other times. Other favourite materials were gold, green feldspar, lapis and cornelian; the last frequently cut into odd shapes such as a locust etc. (fig. 1, 8)

Glazed quartz beads which commence in the pre-dynastic extend down to the 12th dynasty, but probably not later. They are always coloured blue or green. At Der el Bahri blue beads of the early 18th dynasty reached the finest colour, whilst at Tel el Amarna slightly later factories existed which turned out thousands of beads and pendants representing flowers, fruits, etc. (fig. 1, 9 and 10). For colour and daintiness of design these are unsurpassed. Crumb beads in which small pieces of steatite or faience are cemented on to the surface of a faience bead appear in the 5th dynasty and last to the 18th (fig. 1, 11). Glass came into general use in Egypt in the 18th dynasty, although earlier specimens are recorded both from Egypt and Mesopotamia. From the 19th to 22nd dynasty small oblate and cylindrical beads were made by the million to cover mummies, in some cases woven into complete covers with elaborate designs. During this period and down to the Saite period (about 600 B.C.) amuletic beads and pendants representing various emblems and deities were very common. After this date, although quantities of beads were still made in Egypt those found in the Mediterranean area became more interesting. In the Sudan and West Africa numbers of ancient beads are dug up, which are very highly prized by the natives. In some cases these may date from the Roman period.

Eye Beads.—These were almost invariably talismans. One of the earliest forms is the onyx cat's-eye bead from Mesopotamia (fig. 1, 12), of which a specimen is dated 2200 B.C. The majority of eye beads, however, were made of glass. There were four chief varieties: (1) Spot eye beads, in which simple spots of one coloured glass were stuck on to, or pressed into, a matrix of another colour (fig. 1, 13); (2) impressed eye beads in which a ring of different coloured glass was pressed into the matrix (fig. 1, 14); (3) stratified eye beads, in which a spot was pressed into the matrix, a second spot pressed into the first, and so on (fig. 2, 15); (4) inserted cane eye beads, in which pieces of a glass cane or rod with the required pattern in it were broken off and pressed into the matrix. The first and third methods are the earliest, both being used as early as 1300 B.C. The second commenced in the 9th century B.C. The fourth, though usually much later, is occa-

FIG 2 —TYPES OF BEADS IN USE FROM 1300 B.C. TO A.D. 1500

15. Stratified eye, Italy, c. 1300 B.C. Diameter, .75 inch
16. Glass pendant with spirals, Aegean, 1300 B.C. Length, 1.3 inch
17. Glass leech on gold fibula, Carniola, 900 B.C. Length, 3 inches
18. Amber talisman, Brittany, Roman period. Diameter, .75 inch
19. Viking Chequer, Gotland, 850 A.D. Diameter, .9 inch
20. Spiral gold, Ireland, bronze age. Length, 7.5 inches
21. Faience melon, London, Roman period. Diameter, .6 inch
22. Glass with raised spots, Suffolk, late Roman period. Diameter, .5 inch
23. Double wave and spot glass, Kent, Anglo-Saxon. Length, .56 inch
24. Facetted quartz, Cambridgeshire, Anglo-Saxon. Length, 1.7 inch
25. Carved stone, Peru, c. A.D. 1500. Length, 1.25 inch

sionally found in the 6th century B.C. Eye beads continued to be made during Roman and Saxon times and are still manufactured in great quantities at Hebron for protection from the evil eye.

Aegean Beads.—The early beads from Crete and the Aegean islands show decided originality. The most striking novelty was the flat glass bead and pendant (fig. 2, 16) dating to about 1300

B.C. These were made of transparent glass, some colourless, some pale blue and some dark blue. The technique of their manufacture was not used in Egypt until several centuries later. The flush glass crumb bead in which pieces of glass of different colours were pressed flush into a matrix, began to appear at this period; a few centuries later it became a common type.

Mediterranean Area.—The Villanovans (*q.v.*) and Etruscans (*q.v.*) from the 9th to the 6th centuries B.C. used great quantities of beads. A large proportion were of amber which was probably imported from the Baltic, glass beads were extremely common, whilst gold and bronze ones were not infrequent. Some of them are very large, scaraboids over four inches long being made of amber, and spiral beads over six inches long of bronze wire. Besides being strung as necklaces, beads were also used to ornament pins and fibulae. A gold fibula with glass leech bead is shown in fig. 2, 17.

Some of these beads found in Italian tombs appear to be definitely Etruscan, but many belong to a type of which quantities are found all round the eastern Mediterranean and the Black sea, in Italy, Sicily, Corsica, Sardinia, Syria, Carthage and the Crimea. There is no evidence where they were made, but they were probably carried by the Phoenicians as they are found so much in Phoenician colonies.

Northern Europe.—In northern Europe during the neolithic period many amber beads and pendants were worn. Some very large ones come from Denmark. In the French Dolmens are found numbers of beads made of callais, a species of turquoise which is supposed to have been imported from China. In pre-Roman and early Roman times large numbers of beads of amber and glass were worn in Brittany. Some of these have been handed down as amulets and are still worn by the peasants who value them as talismans. Such glass beads are said to preserve the eyesight, and the amber ones to be a certain cure for stomach-ache. In some cases the perforations of the beads have almost worn through and then been filled up with metal (fig. 2, 18).

Amongst the beads from Viking graves of the 7th to the 9th century A.D. are several elaborate chequer beads (fig. 2, 19). These have not been found in graves of the same period in other parts of Europe, but a specimen has been found in a Crimean grave over 1,000 years earlier. This suggests that these Viking beads may have been handed down as amulets in the same way as the Britany beads.

British Beads.—Gold and amber beads of the bronze age are found in southern England and Ireland. The Irish amber beads are similar to the Etruscan and may come from the Mediterranean. But in England elaborate strings with large spacing beads and many small intermediate beads are found. They seem to be confined to this country, where similar necklaces in jet occur. In the Wiltshire barrows segmented blue faience beads are found which closely resemble some made in Egypt during the 18th dynasty. Amongst the Irish gold beads are some bicone beads made from gold wire (fig. 2, 20). In Roman times the melon bead in faience (fig. 2, 21) and glass is common, whilst beads in black glass with coloured eyes (fig. 2, 22) or waves are found. The Saxon period produced great quantities of beads, mostly of glass; these, especially the Kentish ones, show a great similarity to the Merovingian beads of the Rhine district, but there is evidence which suggests that some of them have been made in this country. The double wave and spot bead (fig. 2, 23) occurs in almost all Anglo-Saxon cemeteries. Large faceted crystal beads (fig. 2, 24) and crystal spheres in bronze mounts are typical of this period.

America.—The early civilizations of North and South America produced great numbers of beads. From the Indian grave mounds of North America come beads of stone and shell, both complete shells and shaped beads cut out of large shells. In Peru, beads in turquoise and other stones are found; some of a curious shape which suggests the double axe (fig. 2, 25); whilst from Lake Guatavita in Colombia come quantities of beads and pendants of stone, amber and gold.

Trade Beads.—Since the middle ages the manufacture of beads for sale or barter has been carried on in Europe. Explorers have

at all times found them invaluable when dealing with natives and many of the early trade beads are still greatly prized in the countries where they have been sold. During the 17th and 18th centuries this trade in beads, or "conterie" as it was called, was enormous, and warehouses along the Thames were full of them. At the present day great quantities of beads are worn by all semi-civilized races, by whom they are frequently used as money. These beads show immense variety and are of great interest, but it is impossible to discuss them in this article.

BIBLIOGRAPHY.—H. C. Beck, "Classification and Nomenclature of Beads and Pendants," *Archæologia*, vol. lxxvii. (1928), general classification giving names of different kinds and some remarks on materials and methods of manufacture; Joseph Déchelette, *Manuel d'Archéologie, préhistorique, celtique et gallo-romaine* (1924), many references to early beads, especially those of France; Edward Dillon, *Glass* (1907), references to methods of manufacture and types of glass beads; Gustavus Eisen, "Eye Beads," *American Journal of Archaeology*, vol. xx. pt. 1 (1916), discussion of the dates and methods of manufacture of eye beads; Gustavus Eisen, "Button Beads," *American Journal of Archaeology*, vol. xx. pt. 3 (1916), discussion of the unperforated button beads; Aveneau de la Grancière, *Les Parures pré-historique et antiques en grains d'enfilage et les Colliers talismans Celto-armoricains* (1897), description of, and enquiries into the origin and use of, the talisman necklaces of Brittany, with some account of early necklaces of other countries; Sir W. M. Flinders Petrie, *Amulets* (1914), an exhaustive account of the Egyptian amuletic beads and pendants in the collection at University college, London. (H. Be.)

BEADSMAN or BEDESMAN, a pensioner whose duty it was to pray for his benefactor (M.E. *bede*, prayer). In Scotland there were public almsmen supported by the king and expected in return to pray for his welfare. They wore long blue gowns with a pewter badge on the right arm, and were nicknamed Blue Gowns. Their number corresponded to the king's years. On the king's birthday each beadsman received a new blue gown, a loaf, a bottle of ale, and a leathern purse containing a penny for every year of the king's life. On the pewter badge were their name and the words "pass and repass," which authorized them to ask alms throughout Scotland. The word had a special sense as the name for those almsmen attached to cathedral and other churches, whose duty it was to pray for the souls of deceased benefactors.

BEAK, the horny bill of a bird, and so used of the horny ends of the mandibles of the octopus, the duck-billed platypus and other animals; hence the rostrum (*q.v.*) or ornamented prow of ancient war vessels. The term is also applied, in classic architecture, to the pendent fillet on the edge of the *corona* of a cornice, which serves as a drip and prevents the rain from flowing inwards.

The slang use of "beak" for a magistrate or justice of the peace, has not been satisfactorily explained. The earlier meaning, which lasted down to the beginning of the 19th century, was "watchman" or "constable." The word is also used in certain English public schools as a slang name for a schoolmaster.

BEAKER, a large, wide-mouthed drinking-cup, supported on a flaring base or foot; also, a deep vessel of glass, with a projecting lip, used in laboratories. The beaker, used as a drinking-vessel, was perhaps more popular in the 16th century than at any other period. Various designs in metals that lent themselves to decorations were common. The laboratory type is better known at present—a plain, deep, thin vessel of glass, or sometimes copper or porcelain, with a projecting lip. See **DRINKING-VESSELS**.

BEAK-HEAD, in architecture, an ornament consisting of the top of a bird's head with its beak, or any similar form, used by the Norman Romanesque builders, especially in England, for the decoration of arch mouldings.

BEALE, DOROTHEA (1831–1906), headmistress of Cheltenham Ladies' college, England, was born on March 21, 1831 and died at Cheltenham, Nov. 9, 1906. In 1848 she attended lectures at the newly opened Queen's college, London, and in 1857 was appointed head teacher of the Clergy Daughters' school at Casterton, Westmorland—the "Lowood" of Charlotte Brontë's *Jane Eyre*. In June 1858 Miss Beale was chosen as principal of the Ladies' college, Cheltenham (opened 1854), and during her time there the numbers rose from 69 girls to some hundreds, the financial arrangements were reorganized, and new buildings were erected from 1873 onwards. In 1869, she published the *Reports*

on the Education of Girls, the result of the Endowed Schools Enquiry Commission before which she had given evidence in 1865. Realizing the necessity for training teachers, Miss Beale helped to establish the first residential training college in this country, St. Hilda's college, at Cheltenham; she also opened St Hilda's hall, a college for women, in 1893. From 1895-97 she was president of the Headmistresses' Association.

See E. Raikes, *Dorothea Beale of Cheltenham* (1908).

BEAM, a solid piece of timber, as a beam of a house, of a plough, a loom, or a balance (O.E. *béam*, cf. Ger. *Baum*, a tree, to which sense may be referred the use of "beam" as meaning the rood or crucifix, and the survival in certain names of trees, as hornbeam). From meaning simply the cross-bar of the balance, "beam" has come to be used of the whole, as in the expression "the king's beam," or "common beam," which refers to the old English standard balance, formerly in the custody of the Grocers' Company, London. As a nautical term, "beam" was transferred from the main cross-timbers to the side of the ship; thus "on the weather-beam" means "to windward," and a ship is said to be "wide in the beam" when she is wide horizontally. The phrase "to be on one's beam-ends," denoting a position of extreme peril or helplessness, is borrowed from the position of a ship which has heeled over so far as to stand on the ends of her horizontal beams. The meaning of "beam" for shafts or rays of light comes apparently from the use of the word in translating the Latin *columna lucis*, a pillar of light.

BEAN, the seed of certain leguminous plants cultivated for food all over the world, and furnished chiefly by the genera *Vicia*, *Phaseolus*, *Dolichos* and *Glycine*. The common or broad bean, in all its varieties, as cultivated in Great Britain and on the continent of Europe, is the produce of *Vicia Faba*. The French bean, kidney bean or haricot, which is the common bean of the United States, is the seed of *Phaseolus vulgaris*. In India several other species of *Phaseolus* are raised, and form no small portion of the diet of the inhabitants. Besides these, there are numerous other pulses cultivated for the food both of man and domestic animals, to which the name bean is frequently given. The common bean (*Vicia Faba*) is more nutritious than wheat; and it contains a very high proportion of nitrogenous matter under the form of legumin, which amounts on an average to 24%. It is, however, a rather coarse food, and difficult of digestion, and is chiefly used to feed horses, for which it is admirably adapted. In England, French beans are chiefly, almost exclusively, used in the green state; the whole pod being eaten as a table vegetable or prepared as a pickle.

The common or broad bean (*Vicia Faba*) is an annual which has been cultivated from prehistoric times for its nutritious seeds. The lake-dwellers of Switzerland and northern Italy, in the bronze age, cultivated a small-fruited variety, and it was grown in ancient Egypt, though, according to Herodotus, regarded by the priests as unclean. The ancient Greeks called it *κβαμος*, the Latins *faba*, but there is no suggestion that the plant is a native of Europe. Alphonse de Candolle (*Origin of Cultivated Plants*, p. 320) concludes that the bean was introduced into Europe probably by the western Aryans at the time of their earliest migrations. He suggests that its wild habitat was two-fold some thousands of years ago, one of the centres being on the south of the Caspian, the other in the north of Africa, and that its area has long been in process of diminution and extinction. The nature of the plant favours this hypothesis, for its seed has no means of dispersing itself, and rodents or other animals can easily make prey of it; the struggle for existence which was going against this plant as against maize would have gradually isolated it and caused it to disappear, if man had not saved it by cultivation. It was introduced into China a little before the Christian era, later into Japan, and more recently into India, though it has been suggested that in parts of the higher Himalayas its cultivation has survived from very ancient times.

The broad bean is a plant which will flourish in all ordinary good garden soil. The seeds are sown about 4 in. apart, in drills 2½ ft. asunder for the smaller and 3 ft. for the larger sorts. The soil should, preferably, be a rather heavy loam, deeply worked

and well enriched. For an early crop, seeds may be sown in November and protected during winter in the same manner as early peas. An early crop may also be obtained by dibbling in the seeds in November, sheltering by a frame, and in February transplanting them to a warm border. Successional crops are obtained by sowing suitable varieties from January to the end of June. All the culture necessary is that the earth be drawn up about the stems. The plants are usually topped when the pods

have set, as this not only removes the black aphides which often settle there, but is also found to promote the filling of the pods.

The kidney, French or haricot bean (*Phaseolus vulgaris*), an annual, usually dwarf and bushy but in some varieties vine-like and twining in growth, is widely cultivated in temperate, sub-tropical and tropical regions, but is nowhere known as a wild plant. It was long supposed to be of Indian origin, an idea which was disproved by Alphonse de Candolle, who sums up the facts bearing on its origin as follows.—*Phaseolus vulgaris* has not been long cultivated in India, the south-west of Asia and Egypt, and it is not certain that it was known in Europe before the discovery of America. At the latter epoch the number of varieties in European gardens suddenly increased, and all authors began to

BY COURTESY OF THE U.S. DEPARTMENT OF AGRICULTURE
THE SOY BEAN (GLYCINE SOJA),
SHOWING GROWTH AND GENERAL
STRUCTURE

mention them. The majority of the species of the genus exist in South America, and seeds apparently belonging to the species in question have been found in Peruvian tombs of an uncertain date, intermixed with many species, all American. Hence it is probable that the plant is of South American origin.

The kidney bean is a tender annual, and should be grown in a rich light loamy soil and a warm sheltered situation. The soil should be well enriched with hot-bed dung. The earliest crop may be sown by the end of March or beginning of April. If, however, the temperature of the soil is below 45°, the beans make but little progress. The main crops should be got in early in May; and a later sowing may be made early in July. The earlier plantings may be sown in small pots and put in frames or houses, until they can be safely planted out-of-doors. A light covering of straw or some other simple shelter suffices to protect from late frosts. The seeds should be covered 1½ or 2 in. deep, the distance between the rows being about 2 ft., or for the dwarf sorts 18 in., and that between plants from 4-6 inches. The pods may be used as a green vegetable, in which case they should be gathered whilst they are so crisp as to be readily snapped in two when bent; but when the dry seeds are to be used the pods should be allowed to ripen. As the green pods are gathered others will continue to be formed in abundance, but if old seed-forming pods are allowed to remain the formation of young ones will be greatly checked. There are numerous varieties; among the best are Canadian Wonder, Canterbury and Black Negro.

The scarlet runner (*Phaseolus multiflorus* or *P. coccineus*), a runner bean, is nearly allied to *P. vulgaris*, of which it is sometimes regarded as a variety, but differs in its tall climbing habit. It is naturally perennial and has a thick fleshy root, but is grown in Great Britain as a tender annual. Its bright, generally scarlet flowers, arranged in long racemes, and the fact that it will flourish in any ordinary good garden soil, combine to make it a favourite garden plant. It is also of interest as being one of the few plants that twine in a direction contrary to the apparent motion of the sun. The seeds of the runner beans should be sown in an open plot,—the first sowing in May, another at the beginning of June, and a third about the middle of June. In the London market-

gardens they are sown 8–12 in. apart in 4-ft. rows if the soil is good. The twining tops are pinched or cut off when the plants are from 2–2½ ft. high, to save the expense of staking. It is better, however, in private gardens to have the rows standing separately, and to support the plants by stakes 6 or 7 ft. high and about a foot apart, the tops of the stakes being crossed about one-third down. If the weather is dry when the pods are forming abundantly, plenty of tepid water should be supplied to the plants. In training the shoots to their supports, they should be twined from right to left, contrary to the course of the sun, or they will not lay hold. By frequently picking the pods the plants are encouraged to form fresh blooms from which pods may be picked until the approach of frost.

The Lima bean (*Phaseolus lunatus* or *P. limensis*), a tall biennial with dwarf varieties, bearing a scimitar-shaped pod 2–3 in. long containing a few large seeds, is widely cultivated in the warmer parts of the world.

The young pods of the lablab, a leguminous climbing herb (*Dolichos Lablab*), as well as the seeds, are widely used in the tropics. The plant is probably a native of equatorial Africa, but is now generally cultivated in the tropical countries. The seed of the horse gram (*D. biflorus*) is eaten by the poorer classes in India, and is also, as are the pods, a food for horses and cattle.

The soy bean (*Glycine Soja*, *G. hispida* or *G. Max*) is extensively cultivated in China and Japan, chiefly for the pleasant-flavoured seed, from which is prepared a piquant sauce. It is also widely grown in India, where the bean is eaten, while the plant forms a valuable fodder; it is extensively cultivated also in the United States for fodder, as a soil-improvement crop, and the seed is used for feed and for oil.

Other references to beans will be found under special headings, such as CALABAR BEAN, LOCUST-TREE. There are also several nonleguminous seeds to which the popular name bean is attached. Among these may be mentioned the sacred Egyptian or Pythagorean bean (*Nelumbium speciosum*), and the Ignatius bean (*Strychnos Ignatii*), a source of strychnine.

The ancient Greeks and Romans made use of beans in gathering the votes of the people, and for the election of magistrates. A white bean signified absolution, and a black one condemnation. Beans had a mysterious use in the *lemuralia* and *parentalia*, where the master of the family, after washing his hands three times, threw black beans over his head nine times, reiterating the words "I redeem myself and my family by these beans."

BEAN-FEAST, an annual dinner given by an employer to his workpeople, and thus, colloquially, any jollification. The most probable theory connects the phrase with a feast on Twelfth Night, at which a cake with a bean buried in it was a great feature. The bean-king was he who had the good fortune to have the slice of cake in which was the bean. This monarch was master of the revels like his congener, the lord of misrule. The king of the bean may have originally reigned for the twelve days from Christmas to Twelfth Night, his chief duty being the performance of magical ceremonies for ensuring good weather during the ensuing twelve months. He is probably the lineal descendant of the old king of the Saturnalia.

See WAYZGOOSE; MISRULE, LORD OF; also Brand, *Popular Antiquities of Great Britain* (Hazlitt's ed. 1905), under "Twelfth Night."

BEAR, originally the European brown bear (*Ursus arctus*), but extended to include all members of the family *Ursidae* (see CARNIVORA). Bears are characterized by their massive bodies, short limbs and very short tails; they are omnivorous and are particularly fond of honey; the grizzly bear (*U. horribilis*) and polar bear (*Thalassarctus maritimus*), however, are largely carnivorous. The five toes are provided with large, non-retractile claws, with which most species can climb well, though slowly. In northern countries the animals hibernate in the winter, having grown very fat during the autumn.

The brown bear (*U. arctus*) is found over the temperate regions of the northern hemisphere from Spain to Japan, though extirpated in Britain before the end of the 11th century. It is the commonest species in captivity and can be trained to "dance" to music. A large race inhabits Alaska.

The grizzly bear (*U. horribilis*) exceeds all other American mammals in strength and ferocity. Unlike the brown bear, the flesh is uneatable. Except in the great national parks, where it is strictly preserved, this bear is now rare.

The American black bear (*U. americanus*) is a woodland and largely vegetarian animal. Its valuable fur has led to a big reduction in the numbers of this timid and inoffensive beast.

BY COURTESY OF THE AMERICAN MUSEUM OF NATURAL HISTORY

THE ALASKAN BROWN BEAR

The Himalayan black bear (*U. torquatus*) ranges from the Persian frontier to Assam. It has a white horseshoe-mark on the chest, and is more carnivorous.

The small bruang or Malay bear (*U. malayanus*) lives largely on honey. The spectacled bear (*U. ornatus*) inhabits the Andes. The sloth bear (*Melursus labiatus*) lacks one pair of upper incisors. It is also called the honey

bear, and is the species usually exhibited by Indian jugglers

The polar bear (*Th. maritimus*) is distinguished by its white fur and the stiff bristles on its feet. It is a very active animal, feeding on seals, walruses, fish and dead animals. The female brings forth her young in a chamber in the snow. This bear is confined to the Arctic.

The great cave bear (*U. spelaeus*) of the glacial epoch was bigger than any living species. Its remains have been found in Central Europe and Asia. An allied species (*U. priscus*) inhabited Britain. Bears first occur fossilized in the Pliocene.

BEAR, in dealing, a term used on the Stock Exchange, and in other markets in which speculation occurs, to describe a speculator who sells what he does not possess in the hope that before the account day he will be able to buy back at a lower price, and thus make a marginal profit. He sells for the fall, and his risk may be exceedingly great because there is no theoretic limit to the possible rise that may take place in the stock or product dealt in.

Powerful financial interests sometimes sell at declining prices thousands of shares of stocks that they do not own, for the very purpose of creating an unfavourable impression about the value of such stocks, in the hope of inducing others to throw their

A FAMILY OF POLAR BEARS (THALASSARCTUS MARITIMUS) IN THE ARCTIC.

These animals rank among the largest members of the bear family shares overboard for whatever offers are available. If these bear tactics result in heavy selling by the general public and others, then the original short sellers are able to buy back, or cover, at a considerably lower figure than they received. If one were clever enough to sell short at exactly the right moment, he could make a profit much more rapidly than by holding stocks for the advance in a rising market. This is because stocks are likely to go down in a poor market faster than they rise in a good market. The reason is that a falling market spreads fear, and fear is more suddenly contagious than hope. See also STOCK EXCHANGE; BACKWARDATION; BULL.

BEAR-BAITING and **BULL-BAITING**, sports formerly very popular in England but now suppressed on account of their cruelty. They took place in arenas built in the form of theatres which were the common resort even of cultivated people. In the bear-gardens, which are known to have existed since the time of Henry II., the bear was chained to a stake by one hind leg or by the neck and worried by dogs. Erasmus, writing (about 1500) from the house of Sir Thomas More, spoke of "many

AFTER THE LOUTERELL PSALTER
BEAR BAITING IN THE 14TH CENTURY. THIS CRUEL SPORT, POPULAR IN ENGLAND FOR ABOUT 700 YEARS, WAS NOT PROHIBITED UNTIL 1835

herds of bears maintained in the country for the purpose of baiting." Sunday was the favourite day for these sports. Hentzner describes the whipping of a blinded bear, a popular variation. For a baiting attended by Queen Elizabeth in 1575 13 bears were provided. Of it Robert Laneham (c. 1575) wrote, "it was a sport very pleasant to see, to see the bear, with his pink eyes, tearing after his enemies' approach; the nimbleness and wait of the dog to take his advantage and the force and experience of the bear again to avoid his assaults; if he were bitten in one place how he would pinch in another to get free; that if he were taken once, then by what shift with biting, with clawing, with roaring, with tossing and tumbling he would work and wind himself from them; and when he was loose to shake his ears twice or thrice with the blood and the slaver hanging about his physiognomy." The famous "Paris Garden" in Southwark was the chief bear-garden in London. A Spanish nobleman of the time, who was taken to see a pony baited that had an ape tied to its back, expressed himself to the effect that "to see the animal kicking amongst the dogs, with the screaming of the ape, beholding the curs hanging from the ears and neck of the pony, is very laughable." Butler describes a bear-baiting at length in the first canto of his *Hudibras*.

The Puritans endeavoured to put an end to animal-baiting, although Macaulay sarcastically suggested that this was "not because it gave pain to the bear, but because it gave pleasure to the spectators." The efforts of the Puritans seem, however, to have had little effect, for we find the sport flourishing at the Restoration; but the conscience of cultivated people seems to have been touched, for Evelyn wrote in his *Diary* under the date of June 16 1670: "I went with some friends to the bear-garden, where was cock-fighting, dog-fighting, bear and bull-baiting, it being a famous day for all these butcherly sports, or rather barbarous cruelties. The bulls did exceedingly well, but the Irish wolf-dog exceeded, which was a tall greyhound, a stately creature indeed, who beat a cruel mastiff. One of the bulls tossed a dog full into a lady's lap, as she sat in one of the boxes at a considerable height from the arena. Two poor dogs were killed, and so all ended with the ape on horseback, and I most heartily weary of the rude and dirty pastime, which I had not seen, I think, in twenty years before." Steele also attacked these cruel sports in the *Tatler*. Nevertheless, when the Tsar Nicholas I. visited England as Tsarevich, he was taken to see a prize-fight and a bull-baiting. In this latter form of the sport the bull's nose was usually blown full of pepper to render him the more furious. The bull was often allowed a hole in the ground, into which to thrust his nose and lips, his most vulnerable parts. Sometimes the bull

was tethered, and dogs, trained for the purpose, set upon him one by one, a successful attack resulting in the dog fastening his teeth firmly in the bull's snout. This was called "pinning the bull." A sport called bull-running was popular in several towns of England, particularly at Tutbury and Stamford. At Stamford the running took place annually on November 13, the bull being provided by the butchers of the town, the townspeople taking part in the chase, which was carried on until both people and beast were exhausted, and ended in the killing of the bull. Certain rules were strictly observed, such as the prohibition of carrying sticks or staves that were shod with iron. The Stamford bull-running survived well into the 19th century. Considering the brutality they involved, it is curious that bear-baiting and bull-baiting were not prohibited in England by act of parliament until 1835.

BEARBERRY (*Arctostaphylos Uva-Ursi*), a small shrub of the heath family, Ericaceae (*q.v.*), native to dry, sandy or rocky soil and very widely distributed in high northern regions. In the British Isles it grows on stony alpine heaths; in North America it is found on rocks and bare hills from Labrador and Alaska south to New Jersey, Colorado and California. The trailing, much branched stems, often somewhat matted on the ground, bear leathery, evergreen, entire leaves, small heath-like white flowers, and smooth, red, insipid, berry-like fruits (drupes) about $\frac{1}{4}$ in in diameter. The alpine bearberry (*A. alpina*), a smaller depressed-prostrate shrub, with veiny, toothed leaves and black, juicy, edible fruit, grows on high mountain heaths in the British Isles and from Arctic America south in high altitudes to British Columbia, Colorado and northern New England. (See MANZANITA.)

BEARD, CHARLES AUSTIN (1874—), American historian and professor of politics, was born in Knightstown, Ind., on Nov. 27, 1874. He graduated from De Pauw university in 1898, and after studying at Oxford, Cornell and Columbia universities received the degree of Ph.D. from the last named institution in 1904. His interest was at first in European, and particularly in English, history; and such works as *The Office of Justice of the Peace in England* (1904), and *The Development of Modern Europe* (1907-08), written in collaboration with J. H. Robinson, represent this phase. But the problems of American history soon gained his attention and it is in this field, and in American politics and government, that he accomplished his most significant work, at first as a member of the faculty of Columbia university (1907-15) and later in independent research. In 1917 he became director of the Training School for Public Service in New York city and gave much attention to municipal problems. He was invited to Japan to give advice for reconstruction after the earthquake and embodied some results of his investigations there in *The Administration and Politics of Tokyo* (1923). In 1927 he was called to Yugoslavia on a similar mission. But throughout he continued his research into the formative elements of the American Constitution and political parties and set forth his conclusions in four notable works: *The Supreme Court and the Constitution* (1912), *The Economic Interpretation of the Constitution* (1913), *The Economic Origins of Jeffersonian Democracy* (1915), and *The Economic Basis of Politics* (1922). These have exerted a profound influence upon opinion concerning the origins of the American State, largely because of their contention that political thought is dictated by the economic self-interest of parties rather than by abstract theories, and that the American Constitution, specifically, was evolved by those whose holdings would increase in value by the creation of the form of government which it prescribes. Later he wrote, in collaboration with his wife, Mary Ritter Beard, a more comprehensive study of the national life under the title, *The Rise of American Civilization* (1927); like his other work, it is characterized by the analysis of cause and effect rather than by an array of outstanding phases in chronological order. Like his other work, too, it shows originality of views founded upon independent investigation of sources.

Among his other works are: *American Government and Politics* (1910), *American City Government* (1912), *Contemporary American History* (1914), *History of the American People* (1918,

in collaboration with W. C. Bagley), *History of the United States* (1921, in collaboration with Mary Ritter Beard), and *Cross Currents in Europe To-day* (1922).

BEARD, in modern usage, applies to the hair grown upon a man's chin and cheek. When the chin is shaven, what remains upon the cheeks is called whiskers. "Moustache" or "moustaches" describes the hair upon the upper lip. But the words have in the past had less exact meaning. Beard has stood alone for all these things, and whisker has in its time signified what we now call moustache, as in the case of Robinson Crusoe's great pair of "Turkish whiskers."

The bearded races of mankind have ever held the beard in high honour. It is the sign of full manhood; the lad or the eunuch is beardless, and the bearded woman is reckoned a witch, a loathsome thing to all ages. Also the beard shrinks from the profane hand; the future King John gave deadly offence to the chieftains, when visiting Ireland in 1185, by plucking at their flowing beards. David's ambassadors had their beards despitefully shaven by a bold heathen. Their own king mercifully covered their shame—"Tarry ye at Jericho until your beards be grown"—but the war answered the insult. The oath on the beard is as old as history, and we have an echo of it in the first English political ballad when Sir Simon de Montfort swears "by his chin" revenge on Warenne.

Adam, the primal man, was by tradition created with a beard. Zeus Allfather is bearded, and the old painters and carvers who hardly pictured the first person of the Trinity gave Him the long beard of his fatherhood. The race-fathers have it and the ancient heroes Abraham and Agamemnon, Woden and King Arthur and Charlemagne, must all be bearded in our pictures. With the Mohammedan peoples the beard as worn by an unshaven prophet has ever been in high renown. But before Mohammed's day, kings of Persia had plaited their sacred beards with golden thread, and the lords of Nineveh had curiously curled and oiled beards such as their winged bull wears. Bohadin tells us that Saladin's little son wept for terror when he saw the crusaders' envoys "with their clean-shaven chins." Selim I. (1512-21) comes down as a Turkish sultan who broke into holy custom and cut off his beard, telling a remonstrating Mufti that his vizier should now have nothing to lead him by. But such tampering with tradition has its dangers, and the absolute rule of Peter the Great is made clear when we know that he taxed Russian beards and shaved his own, and yet died in his bed. Alexander the Great did as much and more with his well-drilled Macedonians, and was obeyed when he bade them shave off the handle by which an enemy could seize them.

With other traditions of their feudal age, the Japanese nation has broken with its ancient custom of the razor, and their emperor has beard and moustache; a short moustache is common amongst Japanese officers and statesmen, and generals and admirals of Nippon follow the imperial example. The Nearer East also is abandoning the full beard, even in Mohammedan lands. Earlier shahs of the Kajar house have glorious beards below their girdles, but Násiru'd-Dín and his successor have shaved their chins. The tsar Alexander III's beard might have satisfied Ivan the Terrible, whose hands played delightedly with the five-foot beard of Queen Elizabeth's agent George Killingworth. Indeed the royal houses of Europe are for the most part bearded or whiskered. Leopold II, king of the Belgians, however, was in 1909 the only sovereign with the full beard unclipped. The Austrian emperor, Francis Joseph, retained the moustache and whiskers of the '60s, and the German emperor, William II., for a short period commemorated by a few rare photographs, had a beard, although it was never suffered to reach the length of that beard which gave his father an air of Charlemagne or Barbarossa. In France bearded presidents have followed each other, but it may be noted that the waxed moustache and "imperial" beard of the Second Empire is now all but abandoned to the Frenchman of English comedy. The modern English fashion of shaving clean is rare in France save among actors, and during 1907 many Parisian waiters struck against the rule which forbade them to grow the moustache.

For the most part the clergy of the Roman obedience shave clean, as have done the popes for two centuries and more. But missionary bishops cultivate the long beard with some pride, and

the orders have varying customs, the Dominican shaving and the Franciscan allowing the hair to grow. The Roman Catholic clergy of Dalmatia, secular and regular, are allowed to wear the moustache without beard or whiskers, a concession to national prejudices.

English Fashions.—Amongst English people, always ready to be swayed by fashion, the hair of the face has been age by age, cherished or shaved away, curled or clipped into a hundred devices. Before the immigration from Sleswick the Briton knew the use of the razor, sometimes shaving his chin, but leaving the moustache long. The old English also wore moustaches and forked beard, but, save for aged men, the beard had passed out of fashion before the Norman Conquest. Matthew Paris had a strange idea that the beard was distinctive of Englishmen; he asserts that those who remained in England were compelled to shave their beards, while the native nobles who went into exile kept their beards and flowing locks "like the Easterns and especially the Trojans."

It was only about the year 1000, according to Rodolf Glaber, that men began in the north of France to wear short hair and shave "like actors"; and even in the Bayeux tapestry the old Norman shipwrights wear the beard. But so rare was hair on the face amongst the Norman invaders that William, the forefather of the Percys, was known in his lifetime and remembered after his death as William "Asgernuns" or "Oht les gernuns," i.e., "William with the moustaches," the epithet revived by one of his descendants, making our modern name of Algernon. Fashion swung about after the Conquest, and, in the days of Henry I., Serle the bishop could compare bearded men of the Norman-English court with "filthy goats and bristly Saracens." The crusades, perhaps, were accountable for the beards which were oddly denounced as effeminate in the young courtiers of William Rufus. But for more than four centuries diversity is allowed, beards, moustaches and shaven faces being found side by side. Henry II. is a close-shaven king, and Richard II.'s effigy shows but a little tuft on each side of the chin, tufts which are two curled locks on the chin of Henry IV. But Henry III. is long-bearded, Edward II. curls his beard in three great ringlets, and the third Edward's long forked beard flows down his breast in patriarchal style. The mid-13th century is an age of many full and curled beards, although the region about the lips is sometimes clipped or shaved. The beard is common in the 14th century, the forked pattern being favoured and the long drooping moustache. Henry of Monmouth and his son are shaven, and thereafter beards are rare save with a few old folk until they come slowly back with the 16th century. Henry VIII., always a law to himself, brought back the beard to favour, Stowe's annals giving 1535 as the year in which he caused his beard "to be knotted and no more shaven," his hair being polled at the same time.

The age of Elizabeth saw lawyers, soldiers, courtiers and merchants all bearded. A shaven chin such as that seen in the portrait of Philip Howard, earl of Arundel, is rare, but the beards take a hundred fashions, and satirists and Puritan pamphleteers were busy with them and with the men who wasted hours in perfuming or starching them, in dusting them with orris powder, in curling them with irons and quills. Stubbs gives them a place amongst his abuses. "It is a world to consider how their mowchatowes must be preserved or laid out from one cheek to another and turned up like two horns towards the forehead." The Elizabethan fashions continued under King James, the beard trimmed to a point being common wear; but under King Charles there is a certain reaction, and the royal style of shaving the cheeks and leaving the moustache whose points sweep upward and the chin beard like a downward flame is followed by most of the gentry.

From the Restoration year the razor comes more into use. Young men shave clean. The restored king curls a few dark hairs of a moustache over each cheek, but his brother James is shaven. With the reign of Queen Anne the country enters the beardless age, and beards, moustaches and whiskers are no more seen. In the 18th century the moustache indicated a soldier from beyond sea. A Jew or a Turk was known by the beard, an appendage loathsome as comic. That George III. in his madness should have

been left unshaved was a circumstance of his misery that wrung the hearts of all loyal folk. But we may note that the hair of the face, which disappeared when wigs came in, began to reappear as wigs went out. Early in the 19th century the bucks began to show a patch of whisker beside the ear, and the soldier's moustache became a common sight. Before Waterloo, guardsmen were complaining that officers of humbler regiments imitated their fashion of the moustache, and by the Waterloo year most young cavalry officers were moustached. But for a civilian to grow a moustache was long reckoned a piece of unseemly swagger. Freedom in these matters only came when the troops were home from the Crimea, when officers who had grown beards and acquired the taste for tobacco during the long months in the trenches showed their beards and their cigars in Piccadilly. Then came the Volunteer movement, and every man was a soldier, taking a soldier's licence. The dominant fashion was the moustache, worn with long and drooping whiskers. But the "Piccadilly weepers" of the '60s were out of the mode for the younger men when the '80s began, and by the end of the century whiskers were seen in the army only upon a few veteran officers.

The footman, whose full-dress livery is the court dress of 100 years ago, must show no more than the rudimentary whisker of the early 1800s, and butler, coachman and groom come under the same rule. The jockey and the hunt whip are shaven likewise, but the courier has the whiskers and moustache that once marked him as a foreigner in the English milor's service, and the chauffeur, a servant with no tradition behind him, is often moustached.

Lastly, we may speak of the practice of the royal house since England came out of the beardless century. The regent took the new fashion, and sat "in whiskered state," but his brother and successor shaved clean and disliked even the hussar's moustache. The prince consort wore the moustache as a young man, adding whiskers in later years. King Edward VII. wore moustache and trimmed beard, and his heir has also followed the fashion of many fellow admirals.

(O. B.)

BEARDSLEY, AUBREY VINCENT (1872-1898), English artist in black and white, was born at Brighton on Aug. 24, 1872. In 1883 his family settled in London, and in the following year he appeared in public as an "infant musical phenomenon." In 1888 he obtained a post in an architect's office. In 1891, under the advice of Sir Edward Burne-Jones and Puvis de Chavannes, he took up art as a profession and attended classes at the Westminster School of Art. From 1893 until his death, at Mentone, on March 16, 1898, his work met with a storm of criticism. Beardsley had an unswerving tendency towards the fantastic; he deliberately ignored proportion and perspective, and the freedom from convention which he displayed caused his work to be judged with harshness. In certain phases of technique he excelled, and his earlier methods of dealing with the single line in conjunction with masses of black are in their way unsurpassed, except in the art of Japan. He was always an ornamentalist rather than an illustrator; and his work must be judged from that point of view. His frontispiece to *Volpone* is held by some to be, from this purely technical standpoint, one of the best pen-drawings of the age. His posters for the Avenue theatre and for Mr. Fisher Unwin were among the first of the modern cult of that art which at that time was by few regarded as such.

The following are the chief works which are illustrated with drawings by Beardsley: the *Bon Mot Library*, *The Pall Mall Budget*, and *The Studio* (1893), Sir Thomas Malory's *Morte d'Arthur* (1893-94), *Salomé* (1894), *The Yellow Book* (1894-95), *The Savoy Magazine* (1896), *The Rape of the Lock* (1896).

See also J. Pennell, *The Studio* (1893); Symons, *Aubrey Beardsley* (1898); R. Ross, *Volpone* (1898); H. C. Marillier, *The Early Work of Aubrey Beardsley* (1899); Smithers, *Reproductions of Drawings by Aubrey Beardsley*; John Lane, *The Later Works of Aubrey Beardsley* (1901); R. Ross, *Aubrey Beardsley* (1908).

BEARDSTOWN, a city of Cass county, Illinois, U.S.A., on the east bank of the Illinois river, about 100 miles north of St. Louis. It is served by the Baltimore and Ohio and the Burlington railways and by steamboats. The population in 1920 was 7,111. It has important fisheries, the extensive railroad shops and other industries. Laid out in 1827 and named after Thomas Beard, who had settled near by in 1820, it was incorporated as a city in 1896. The old court-house, in which Abraham Lincoln won his "Armstrong murder case" in 1854, is now the city hall.

BEARER, strictly "one who carries," a term used in India for a palanquin-bearer, and now especially for a body-servant. The term is also used in connection with military ambulances, and "bearer" companies formed part of the Royal Army Medical Corps until amalgamated with the field hospitals to form field-ambulances (see **MEDICAL SERVICE**). In banking and commerce the word is applied to the holder or presenter of a cheque, draft or other negotiable instrument not made payable to a specific person; it has also a technical use, as in printing, of anything that supports pressure in machinery, etc.

BEARER SECURITIES. Stocks and shares can be held in various shapes by the proprietor. The bond to bearer is a document stating upon its face that the bearer of it is entitled to a specified amount of stock in the loan, debenture, share or other security which that bond represents. The instrument may be for a British Government stock, such as Consols or War loan; for (most popular of all in this shape) foreign government loans; for shares in a rubber, oil, mining or other such company. The interest or dividend payments are met by the provision of coupons, small pieces of paper, numbered and, as a rule, dated, which must be presented to named bankers when the payments become due, and which, after a few days for examination, will be exchanged for cheques in payment of interest or dividend due on his holding.

Risk of Loss.—Bearer securities are regarded as being more liable to loss than are registered or inscribed stocks and shares, for the latter must be dealt with by deed of transfer, involving signatures and witnesses, whereas bearer securities belong, as the name implies, to the bearer, and can be passed from hand to hand like a bank-note. A stolen bond may be difficult to trace to the thief if he has succeeded in selling it and in hiding his subsequent tracks after being paid for it. The British investor greatly prefers registered or inscribed stocks and shares, for reasons of safety, but the French, Belgian and other European Continental capitalist has an equally marked preference for bearer securities, and why there should be this difference of predilection is a pretty problem for the financial psychologist to tackle.

American Methods.—The American partiality is for a combination of bearer-and-registered security. While the bonds of American railroads are generally bearer securities, the share capital is represented most often by certificates made out in the name of an individual or a firm who, when selling, will sign the certificates on the back and pass them on to buyers who not infrequently treat the certificates as bearer securities, leaving the stock or share in the names of the original holders as stated on the face of the deed. The certificates pass from hand to hand in the same way as a bearer security, although any holder can have the stock registered, if he desires it, into his own or other name. Dividends, as they fall due, are claimed and collected by the holder at the time the payments fall due: if the registered proprietor does not want to be troubled with such claims, he merely gives notice of his desire, and the actual proprietor will then put the shares into his own or some other name. Various companies issue registered bonds, but these securities are not to bearer. The risk of loss entailed by the holding of a bearer security is the reason why many proprietors deposit such bonds with their bankers, who will detach coupons when these fall due, present them for payment to the proper agents and credit the interest or dividend to the proprietors' banking accounts.

FROM BEARDSLEY, "ILLUSTRATIONS FOR SALOMÉ"
"THE REWARD OF THE DANCER."
A CHARACTERISTIC SPECIMEN OF THE WORK OF AUBREY BEARDSLEY

Stamps on Bonds.—Bearer securities in Great Britain require to be stamped with a duty of £2 on every £100 upon their first being negotiated. After this no further charge is made. Therefore it is cheaper to deal with bearer securities than it is with those registered stocks and shares which take a 1% stamp when they are transferred from one holder to another. The prejudice of the Continental investor in favour of bearer securities is so pronounced that many companies in whose shares there is an international interest have arrangements for conversion of registered shares into bearer securities, and vice versa.

BEAR-GRASS (*Xerophyllum tenax*), a North American plant of the lily family (Liliaceae), called also elk-grass, squaw-grass, fire-lily and turkey-beard, native to mountainous districts from northern California to British Columbia and eastward to Montana. It is a very smooth light-green perennial with a stout, unbranched stem, from 2 ft. to 6 ft. high, which rises from a woody, tuber-like rootstock with cord-like roots. At the base the stem bears a dense tuft of very narrow, grass-like, rough-edged leaves, from $\frac{1}{2}$ in. to $\frac{3}{4}$ in. wide and from 2 ft. to 3 ft. long; the leaves of the upper part of the stem are similar but much smaller. At flowering, which occurs only once in from five to seven years, the top of the stem develops a large showy cluster, 6 in. to 18 in. long, of very numerous small creamy white flowers, each on a slender stock 1 in. to 2 in. long. In many parts of its range the plant is very common on dry hillsides. When in bloom it is a striking feature of the vegetation of mountain slopes. Because of its attractive appearance it is a favourite with tourists who visit alpine resorts within its range, being especially abundant in Mt. Rainier and Glacier national parks. Hupas and other north-western Indians used the fibres of the leaves in making garments and baskets and roasted the bulbous rootstocks for food. The turkey-beard (*X. asphodeloides*) of the southern United States, found in dry pine-barrens from New Jersey to Florida, is similar but with less showy flowers. In the Southern and South-western United States the name bear-grass is given to various kinds of yucca, especially to *Yucca filamentosa* and *Y. glauca*; also to the camas (*Camassia esculenta*) and the aloe-like *Dasylyrion texanum*, all of which have grass-like leaves.

BEARINGS, the name given to the supports of a rotating shaft. The shaft imposes a load on each of the bearings supporting it, and it is turned against the frictional resistances caused by this loading.

The main shaft seen in a workshop carries pulleys from which belts transmit power to the machinery. Such a shaft loads its bearings not only with its own weight and the weights of the pulleys, clutches, and couplings keyed to it, but with the tensions from the driving belts on the pulleys and with the dynamical forces caused by the mere rotation of unbalanced masses. The dynamical forces increase as the square of the speed. The dynamical force, f , acting on the shaft at a point where a mass weighing W lb. is unbalanced in the sense that its centre of mass is r feet from the axis of rotation, may be calculated from

$$f = 1.2 W n^2 r.$$

In this expression n is the speed of the shaft in revolutions per second, r is in feet, and f is in pounds. If, for example, a large pulley on the shaft is out of balance to the extent of 10 lb. at 1 ft. radius, then when the shaft turns 300 times per minute the force f is 300 lb. This force always acts along the radius of the unbalanced mass. If the speed be doubled to 600 turns per minute, the force f is quadrupled to 1,200 lb. This force not only increases the friction at the bearings but sets up vibration because it is continually changing in direction. All parts attached to the shaft and rotating with it should therefore be carefully balanced to prevent undue loading of the bearings and to avoid setting up vibration. The rotation of the shaft against the frictional resistances in the bearings caused by the loading, absorbs energy from the prime mover, and this energy is converted into heat. Shafts and bearings assume the temperature of their surroundings when not at work, but immediately the shaft is set in motion, heat is produced at the rubbing surfaces of shaft and bearing and the temperature of the bearing rises, and continues to rise until the heat pro-

duced by friction per second is exactly balanced by the heat escaping from the bearing per second by conduction, convection, and radiation to the cooler surroundings. When the balance is struck the temperature of the bearing remains constant. Thus a bearing at work must always be hotter than its surroundings in order to establish a heat flow sufficient to dissipate the heat produced.

The dominating principle of design is therefore so to proportion the parts to the loads and the lubrication to the speed that

FIG. 1.—DETAILED DRAWING OF A PLUMMER BLOCK

the heat necessarily produced by the rotation of the shaft is dissipated without undue rise of temperature. If by any chance the frictional resistance is abnormally increased by failure of the lubrication, by dirt getting between the rubbing surfaces, or by unexpected increases of load or speed, the temperature of the bearing rises dangerously until ultimately the rubbing surfaces may seize together, causing perhaps a broken shaft and other troubles.

A Plummer Block.—The mechanical details of a bearing in common use for general millwrighting purposes are shown in fig. 1.

The shaft (*see* upper drawing) is encircled by a gun metal or brass cylinder split longitudinally into halves specifically called "brasses" (*see* lower drawing). End flanges prevent endwise movement. The part of the shaft encircled by the brasses is called the journal. Shallow grooves cut in the surface of the brasses distribute oil from the wick lubricator to the rubbing surfaces. The brasses are secured between a base block of cast iron and a cast iron cap by the bolts as shown. The complete unit is called alternatively a pillow block, plummer block, or pedestal. The pillow blocks themselves are supported on brackets secured to the wall, or cross beams or any suitable bearer. When the cap is clamped home the brasses should be in close contact along their longitudinal joint and the cap should stand quite clear of the base block; the clearance is shown in the lower figure. The brasses can be let together to compensate for slight wear by filing away along the longitudinal joint. To facilitate this process, new

FIGS. 2 AND 3.—DIAGRAM OF THE AXLE BOX OF A RAILWAY GOODS WAGON

brasses are sometimes separated along their longitudinal joint by a thin liner or by a few thin steel strips called shims. Thinning the liner, or the removal of a shim, allows of adjustment as wear proceeds without filing the brasses.

The brasses are made of gun metal or brass and are often lined with antifriction metal. The metal is usually an alloy of tin, antimony and lead (the proportions vary), and from its colour is called generally white metal. An antifriction metal must be soft enough to yield to slight inequalities in the shaft but hard enough to resist abrasion on the surface.

An Axle Box.—Figs. 2 and 3 show a bearing in which the load *W* is imposed on the journal from the brass. It is the axle box of a railway goods wagon. The load acts always vertically downwards so that one brass only is necessary, as shown in diagram. It rests on the journal and engages the axle box crown with a hemispherical central hump. It is thus able to turn slightly and adjust itself to any want of exact alignment between axle box and journal. The bottom part of the axle box is formed into an oil reservoir which has an inlet for replenishment. A pad of cotton wick, woven on a tin frame, is pressed up against the bare underside of the journal by a spring. The upper part of the pad is finished as a sort of brush. The oil is fed to the brush by the capillary action of the streamer in the oil. The bottom part of the box is held in place by strong bolts, and a leather ring, as shown in fig. 2, is fitted to prevent dust from entering the axle box.

The Oil Film.—Given proper conditions of form and relative velocity between the rubbing surfaces of journal and brass, Beauchamp Tower found that with unlimited supply of oil a film insinuates itself between the surfaces, so converting the frictional resistance between greased metal surfaces into the shearing resistance of an oil film under pressure. The oil film automatically builds itself between journal and brass and shoulders the load transmitted from one to the other. Although the pressure in the film varies from point to point of its extension round the journal, yet the sum of these variable pressures is equal to the total load transmitted through the bearing. The condition of form is that the brass shall have a slightly less curvature than the journal. The unholed brass would therefore touch the journal along a line parallel to the axis of the journal. If a load is applied to the bearing and oil is pumped between the brass and the journal at rest, the brass is separated slightly from the journal and the line of contact becomes a position of closest approach. This position is situated directly under the line of action of the load. A cross section of the bearing (see fig. 11) at right angles to the axis of the journal would show the position of closest approach directly under the load, and the brass would be seen receding from the

journal both to right and left of this position. The oil film would look like a pair of narrow wedges curving round the journal with the sharp ends joined in the position of closest approach and the blunt ends at the edges of the brass. When the journal is turned at sufficient speed this oil film is formed automatically, providing the supply of oil is sufficient; but when the position of closest approach is ahead of the line of load (see fig. 11) in the direction of rotation, the oil wedge in the direction ahead of the position of closest approach becomes shorter, and the other wedge longer and with a blunter end than the leading wedge. Oil is brought into the film, by the rotation of the shaft, at this blunt end. A brass is always bored slightly larger than the journal so that the journal is able to take up a slightly eccentric position in relation to the brass and so accommodate itself to the necessary condition.

The condition of speed cannot be stated precisely because the viscosity of the oils used for lubrication vary with the kind of oil, the pressure in the film, and the temperature. The plummer block illustrated in fig. 1 is an example in which the conditions are not fulfilled because the supply of oil is not copious enough from the wick lubricator to allow the film to form even when a sufficient relative velocity is reached. The axle box is an example in which viscous lubrication is approached. The bottom of the journal is always kept greased by the pad; oil is carried round and a film will form if there is enough oil carried. Beauchamp Tower found that with pad lubrication oil was not carried to the brass in sufficient quantity to form a true film. After the experiments of Beauchamp Tower had been published and the fact had been established that, in suitable conditions, an oil film forms, Prof. Osborne Reynolds showed that its formation could be predicted from the principles of the flow of viscous fluids, and he deduced an expression relating the pressure at any given point in the film to the dimensions of the bearing and the variables of the lubricant. This work was published in the *Phil. Trans.* of 1886. A brief account of this outstanding investigation is given below.

A High Speed Bearing.—The bearing shown in fig. 4 is designed to support one end of the shaft of a turbo alternator which turns at a speed of 1,000 revolutions per minute. The bearing is 12 in. in diameter and 48 in. long, and carries a load of about 12.8 tons. The brasses, now unsplit longitudinally, are put in from the ends; they are lined with white metal, seen as a thin black cylinder round the journal, and oil is fed to their centre under a head of pressure, due to a tank on a tower, through an inlet pipe. From the middle of the bearing the oil flows right and left between the rubbing surfaces and escapes at each end into the base of the housing from which it flows away to a tank in the base of the tower. Here it is cooled and pumped back to the top tank from which it again flows into the cool oil main sup-

plying a number of bearings in parallel, of which the illustration is one. There is thus an unlimited supply of oil, a sufficient relative speed, and oil films form. The work done against the shearing resistance of the oil film heats the oil to a point which is well within the safe limit. But as an extra precaution the bearing is formed so that water can be circulated round the brasses through the passages as marked. The relative speed of rubbing is in this

FIG. 4.—A HIGH SPEED BEARING FOR THE SHAFT OF A TURBO ALTERNATOR

bearing about 50ft. per second and in normal conditions the temperature rises about 20°C above its surroundings.

Intensity of Load.—The intensity of the load on a bearing is measured by dividing the total load it carries by the projected area of the journal. The projected area is the product of the diameter of the journal and its length. Thus the projected area of a journal 12in. diameter and 48in. long is 576 sq. in., and assuming the load it carries to be 12.8 tons, the intensity of loading is $12.8 \times 2240 / 576 = 50$ lb. per sq. in. When the shaft is turning under the action of a continuous load the permissible intensity of loading is less than if the load is intermittent. A table of values of intensity of loading used in practice is given in the article LUBRICANTS.

High Speed Engines.—Bearings of different constructional forms are grouped together in an engine. In particular the high speed internal combustion engine for air craft or motor-cars furnishes many examples. In an engine of this type the moving parts are enclosed and the crank shaft is held in a line of bearings with split brasses and caps to allow it to be put in place. The bearings may be formed of white metal directly lining the cap and cylindrical seatings forming part of the framing itself. Thus a shaft with six cranks will usually have seven bearings in line to support it, one between each crank and an outside bearing at each end. Each connecting rod connects a piston to a crank journal by a bearing called a big end bearing and is jointed to the piston by one called a small end bearing. The big end brasses are split to allow connection to the crank journal, but the little end brass may be put in place as a bush. The bearings are in general supplied with oil under pressure from a pump driven by the engine itself. The crank case is formed into a well from which the pump draws oil through a filter. The pump delivers its charge through a spring loaded relief valve, by which the pressure of delivery can be regulated, into pipes and channels leading to the several bearings included in the forced circulation system.

Before the existence of a film was suspected and the advantages of forced lubrication were understood, it was the practice to construct high speed engines single acting only, to avoid the reversal

of thrust at the bearings when the connecting rods change their action from push to pull. Since the bearings are always a little larger than the journal, a reversal of thrust in the absence of an oil film causes a knock and high speeds are impossible.

Thrust Bearings.—A shaft which transmits a thrust in a direction along its length is held in a form of bearing called a thrust block. The thrust from the screw propeller is delivered to the hull of a ship through a thrust block of the kind illustrated diagrammatically in fig. 5. A number of collars are formed on the propeller shaft and into the grooves between them are fitted half rings, horseshoe shape, which engage in corresponding grooves in the housing. The thrust from the collars is transmitted through the half rings to the housing. The housing is secured to the hull, and so the hull gets the thrust from the propeller. The method of construction allows individual rings to be adjusted so that the thrust is equally divided between them. If any collar fails to take its share of the thrust, extra thrust is thrown on the other collars and heating may ensue. To guard against this, arrangements are made to cool the bearing with water. The contact area between collars and rings is proportioned so that the thrust does not exceed 50 to 70 lb. per sq. in. The limitation of the thrust intensity to these figures involves a multiplication of the collars to an impossible extent for large thrusts, so that the power which can be transmitted through one shaft is limited. This limitation has been removed by the remarkable inventions of Michell.

The Michell Bearings.—Michell developed Osborne Reynolds' mathematical theory of lubrication and ultimately applied his conclusions to the design of a single collar thrust which has revolutionized the design of marine thrust blocks. Fig. 6 is a diagrammatic sketch of a section through a Michell block. The thrust from the collar is transmitted to the housing fastened to the hull through a ring or segment of pads. A segment of six pads is seen in the end view in fig. 6. Each pad transmits its share of the thrust to the housing through a blunt knife edge, as shown in profile in the lower diagrammatic drawing (fig. 6). The thrust through the pads is delivered immediately to the segments of horse-shoe shape fitted into the housing (shown in outline). This method of construction facilitates assembling and ensures that the load is transmitted from the shaft to the lower part of the housing in the line of thrust. The plan shows a pad of the set for a head running tilted about its blunt knife edge, with a wedge-shaped film of oil between it and the moving surface of the collar. The base of the housing is formed into an oil-bath, and rotation of the shaft ensures a continuous supply of oil to all the pads. Stops (not shown in the sketch) are added to the horseshoe segments to prevent circumferential movement. The pads are made of gun metal or

FIG. 5.—DIAGRAM ILLUSTRATING THE THRUST BLOCK

cast-iron faced with white metal. The blunt knife edge is placed to pass nearly through the estimated position of the centre of pressure in the film. The intensity of thrust which may be safely used is 300 lb. per sq. in. A block of this kind fitted to H.M.S. "Hood" transmits through a single collar 36,000 h.p. corresponding to a thrust of about 100 tons.

The Michell principle of pad lubrication has been extended to journals supporting vertical loads. An ordinary high speed bearing may be regarded as a single pad bearing, the conditions for the formation of the oil wedge being realized by slight automatic

FIG. 6—DRAWING OF A SECTION THROUGH A MICHELL BEARING, SHOWING THE SINGLE COLLAR THRUST THAT HAS REVOLUTIONIZED THE DESIGNS OF THRUST BLOCKS IN MARINE PROPELLING MACHINERY

movement of the journal into an eccentric position in relation to the brass. When a number of pads are incorporated in a bearing, then as many oil wedges form as there are pads, and the size of a bearing for a given load is considerably reduced. The twin-screw steamship "Gouverneur-General Chanzy," built by Cammell Laird and Co. Ltd., is stated to be the first ship in which the whole of the main and thrust bearings of the propelling machinery have been constructed on the Michell principle. The details may be studied in *Engineering*, July 28, 1922

Ball and Roller Bearings.—

Ball bearings enable the resistance to rolling to be substituted for sliding resistance and are especially useful for high-speed bearings required to carry moderate loads. The ball elements of a bearing are manufactured as standard units and these units are incorporated in the complete design of a bearing. A typical ball bearing unit with a single row of balls is shown in fig. 7. The inner and the outer race, representing two diameters, enclose completely the ring of balls. A cage is added to prevent adjacent balls from touching because, when rolling in their races, adjacent surfaces are moving in opposite directions. The cage is seen clearly in the perspective sketch to the left of the figure. Units are made with double rows of balls. A single plate thrust bearing is shown in fig. 8. It consists of two flat rings with races formed on their faces for the single ring of balls seen. A cage is added to separate the balls.

Balls are made of high grade steel hardened and finished to exact dimensions. The ball races and rings are also made of high grade steel hardened and finished by grinding. Rolling resistance is not easily analysed into all the factors involved in the total resistance, but the minute elastic distortions of the hardened balls and races and the slight relative slipping, probably contribute the major part of the resistance when the bearing is properly housed and set up (See Reynolds, *Scientific Papers* Vol. I. for theory of rolling friction.) The manufacturers supply a wide range of sizes in each type together with com-

plete particulars regarding loads and speeds, so that a suitable unit may be selected for the particular problem in hand. The units have then to be incorporated in a suitably designed housing.

A Skefko design of a lathe head incorporating two double row self-aligning bearings and a double row thrust bearing is shown in fig. 9. This illustrates a fundamental principle of design in the use of ball bearing units, namely that the shaft must be located by one unit only. The outer races of the other bearing must be free to take up longitudinal position determined by the balls. The lathe spindle is located by the middle plate of the double thrust bearing. This plate is clamped to the spindle by the bushes of which one is a nut. The outer plates then abut against faces in the housing, but the outer rings of the double thrust bearing supporting the spindle are free to slide longitudinally in the housing. The inner races are however clamped securely to the spindle in the way shown in the sketch.

A Timken design for a front axle bearing for a motor-car is shown in fig. 10. This illustrates the use of a taper roller bearing. Adjustment can be made for any slight wear that may occur.

Ball and roller bearings are used in motor vehicles, and the quietness and smoothness of the motion of a well-made car are due to the frictionless qualities of the ball bearings in which the moving parts are mounted. Experiments on ball and roller bearings are recorded in "Roller and Ball Bearings" by Prof. Goodman, *Proc. Inst. Civil Eng.*, Vol. 189. Much technical information will be found in A. W. Macaulay's *Handbook on Ball and Roller Bearings* (1924).

Bearing Friction.—If W is the total load on a bearing, and if μ is the co-efficient of friction between the rubbing surfaces, the tangential resistance to turning is expressed by the product μW . If v is the relative velocity of the rubbing surfaces, the work done per second against friction is $\mu W v$ foot pounds. The co-efficient μ is a variable quantity. It varies between values characteristic of solid friction for imperfectly lubricated surfaces and values characteristic of fluid friction for surfaces separated by an oil film. Beauchamp Tower ("Report on Friction Experiments," *Proc. Inst. Mech. Eng.*, Nov 1883) found that when oil was supplied to a bearing by means of a pad the co-efficient of friction was approximately constant with the value $1/100$, thus following the characteristics of solid friction; but when the journal was lubricated by means of an oil-bath the co-efficient of friction varied nearly inversely as the load, thus making $W\mu$ a constant, a characteristic of fluid friction. Tower's experiments were carried out at nearly constant temperature. O. Lasche (*Zeit. Verein deutsche Ingenieure* 1902, 46, pp 1881 et seq) found that the formula $p\mu t = 2$ expressed the results of his experiments. In this expression p is the load per unit of projected area of the bearing in kilograms per sq. cm, t is the temperature of the bear-

ing in degrees C. If p is changed to lb. per sq. in., the constant 2 is changed to 30 approximately. The expression is valid between the limits of pressure 14 and 213 lb. per sq. in., between limits of temperature 30°C and 100°C and between limits of relative velocity between the rubbing surfaces of 3 and 50 ft. per sec. Experiments bearing on the value of μ are recorded in O. Lasche's *Materials and Design in Turbo-Generator Plant*, trans. by A. L. Mellanby (1927).

With the exception of the work of Michell, nothing of fundamental importance has been done since the researches of Beau-

parative result it was found that the co-efficient of viscosity for castor oil at 40°C is about six times as great at a pressure of six tons per sq. in. as at one atmosphere, whilst an animal oil called trotter oil shows a viscosity only 1.16 times as great for the same range of pressure, and yet the tests show that the frictional resistance in the bearing of both oils is about the same. The inference is that the frictional resistance of an oil film does not depend only upon the viscosity of the lubricant. The report contains much experimental work relating to the properties of lubricating oil of value to the engineer. A new committee, The Lubrication Research Committee, was appointed in 1925 to continue research in the subject but it has not yet issued a report.

Theory of Lubrication.—After the publication of Tower's experiments on journal friction Osborne Reynolds showed (*Phil. Trans.*, 1886, p. 157) that the facts observed in connection with a journal lubricated by means of an oil-bath could be explained

BY COURTESY OF THE TIMKEN ROLLER BEARING CO.

FIG. 10.—CROSS SECTION ILLUSTRATING THE USE OF A TIMKEN BEARING ON A MOTOR CAR AXLE

champ Tower carried out for the Institution of Mechanical Engineers (1883-91) and the brilliant work of Osborne Reynolds based upon the results. The Report of the Lubricants and Lubrication Enquiry Committee appointed by the Department of Scientific and Industrial Research in 1917 was published in 1920. The Committee reviewed the knowledge existing at the time of their report and compiled an exhaustive bibliography of the subject. This bibliography is not separately published but may be consulted at the office of the Department, 16, Old Queen street, London. Included in the report are many data derived from experiments initiated by the Committee. The report gives the following approximate values of μ .

Unlubricated surfaces	0.1 to 0.4
Imperfectly lubricated surfaces called greasy surfaces	0.01 to 0.1
Completely lubricated surfaces with formation of oil film giving what is called viscous friction	0.001 to 0.01

Included in the report are the results of experiments made to find how μ varied with high pressures. Quoting only one com-

FIG. 11.—DRAWING OF JOURNAL AND BRASS, ILLUSTRATING THE PRINCIPLE THAT THE RADIUS OF THE BRASS MUST BE GREATER THAN THE RADIUS OF THE JOURNAL. I IS THE CENTRE OF THE BRASS AND J THE CENTRE OF THE JOURNAL

by a theory based upon the general principles of the motion of a viscous fluid. It is first established as an essential part of the theory that the radius of the brass must be slightly greater than the radius of the journal as indicated in fig. 11, where J is the centre of the journal and I the centre of the brass. Given this difference of curvature and a sufficient supply of oil, the rotation of the journal produces and maintains an oil film between the

rubbing surfaces, the circumferential extent of which depends upon the rate of the oil supply and the external load. With an unlimited supply of oil, *i.e.*, with oil-bath lubrication, the film extends continuously to the extremities of the brass—unless such extension would lead to negative pressures and therefore to a discontinuity, in which case the film ends where the pressures in the film become negative. The minimum distance between the journal and the brass occurs at the point H (fig. 11), on the off-side of the point O where the line of action of the load cuts the surface of the journal. To the right and left of H the thickness of the film gradually increases, this being the condition that the oil-flow to and from the film may be automatically maintained. With an unlimited supply of oil the point H moves farther from O as the load increases until it reaches a maximum distance, and then it moves back again towards O as the load is further increased until a limiting load is reached at which the pressure in the film becomes negative at the boundaries of the film, when the boundaries recede from the edges of the brass as though the supply of oil were limited.

In the mathematical development of the theory it is first necessary to define the co-efficient of viscosity. This is done as follows: If two parallel surfaces AB, CD are separated by a viscous film, and if whilst CD is fixed AB moves in a tangential direction with velocity U , the surface of the film in contact with CD clings to it and remains at rest, whilst the lower surface of the film clings to and moves with the surface AB. At intermediate points in the film the tangential motion of the fluid will vary uniformly from zero to U , and the tangential resistance will be $F = \mu U/h$, where μ is the co-efficient of viscosity and h is the thickness of the film. With this definition of viscosity and from the general equations representing the stress in a viscous fluid, the following equation is established, giving the relations between p , the pressure at any point in the film, h the thickness of the film at a point x measured round the circumference of the journal in the direction of relative motion, and U the relative tangential velocity of the surfaces,

$$\frac{d}{dx} \left(h^3 \frac{dp}{dx} \right) = 6\mu U \frac{dh}{dx} \dots \dots \dots (1)$$

In this equation all the quantities are independent of the co-ordinate parallel to the axis of the journal, and U is constant. The thickness of the film h is some function of x , and for a journal Reynolds takes the form,

$$h = a \{ 1 + c \sin(\theta - \phi_0) \}$$

in which the various quantities have the significance indicated in fig. 11. Reducing and integrating equation (1) with this value of h it becomes

$$\frac{dp}{d\theta} = \frac{6R\mu U c \{ \sin(\theta - \phi_0) - \sin(\phi_1 - \phi_0) \}}{a^3 \{ 1 + c \sin(\theta - \phi_0) \}^3} \dots \dots \dots (2)$$

ϕ_1 being the value of θ for which the pressure is a maximum. In order to integrate this the right-hand side is expanded into a trigonometrical series, the values of the co-efficients are computed, and the integration is effected term by term. If, as suggested by Prof. J. Perry, the value of h is taken to be $h = h_0 + ax^2$, where h_0 is the minimum thickness of the film, the equation reduces to the form

$$-\frac{dp}{dx} = \frac{6\mu U}{(h_0 + ax^2)^2} + \frac{C}{(h_0 + ax^2)^3} \dots \dots \dots (3)$$

and this can be integrated. The process of reduction from the form (1) to the form (3) with the latter value of h , is shewn in full in *The Calculus for Engineers* by Prof. Perry (p. 331), and also the final solution of equation (3), giving the pressure in terms of x .

Reynolds, applying the results of his investigation to one of Tower's experiments, plotted the pressures through the film both circumferentially and longitudinally, and the agreement with the observed pressure of the experiment was exceedingly close. The whole investigation of Reynolds is a remarkable one, and is in fact the first real explanation of the fact that oil is able to insinuate itself between the journal and the brass of a bearing carrying a

heavy load. Reynolds assumed the bearing to be of infinite width. In the actual bearing of finite width the oil leaks away from the film at the sides and is not all discharged from the front edge of the brass. Michell developed the theory and solved the problem of a bearing of finite width (see *Zeit. für Math. und Physik*, Vol. 50, pp. 97-155, 1904; and two articles in *Engineering*, "The Theory of the Michell Thrust Bearing," Feb. 20, 1920, p. 233, and "The Michell Thrust Bearing" by Robert Oliphant Boswell, Aug. 7, 1925). Reference may be made to the report of the Lubricants and Lubrication Enquiry Committee, mentioned above, for important references to papers and experimental results, and also to *Lubrication and Lubricants*, by Archbutt and Deeley (1927). (See also LUBRICATION.) (W. E. D.)

UNITED STATES PRACTICE

Bearings signify the stationary support which carries a moving element of a machine. The commonest form is the support of a

FIG. 12.—THE HYATT ROLLER. A BEARING WHICH IS A SPIRAL CORD AND FLEXIBLE BOTH AS TO DIAMETER AND STRAIGHTNESS

revolving shaft. The quality usually required in a bearing is that it shall allow the supported member perfect freedom for one form of motion, such as rotation, at the same time preventing it from performing any other form of motion. The contacting surfaces between the moving and stationary elements offer more or less resistance to motion, depending on the material used and the smoothness of the surfaces. In nearly all cases the surfaces are separated either by a film of oil or by steel balls or rollers. Bearings may be classified into two distinct types; sliding, and rolling.

Sliding Bearings, in common use in machinery, are those whose sliding surfaces are separated by a film of oil or other coating having low friction. Sliding bearings are divided into three types; right line, in which the motion is parallel to the elements of the sliding surface; journal bearings, in which two machine parts rotate relatively to each other; thrust bearings, in which the end thrust in bevel and worm gearing, or in general any force acting in the direction of the shaft axis, is taken up.

Rolling Bearings, commonly called anti-friction bearings, are subdivided into two groups, ball and roller. There has been considerable development with the design and application of the rolling bearings in the United States. In this type, rollers or balls

FIG. 13.—THE SHORT ROLL. NORMA-HOFFMAN BEARING. Diagram shows the two ribs, integral with the inner raceway, which guide the roll

are interposed between the moving and stationary element of a machine. The resistance to motion, the rolling friction, is usually found to be very small in comparison to the sliding friction of plain bearings. By the use of anti-friction bearings reduction of frictional resistance has been made possible on all kinds of mechanical contrivances, including bearings for shafts, railway axle boxes, axle boxes for tram-cars, automobiles and innumerable industrial machines. In ball bearings the load is concentrated at a few points where the balls touch the race, and in the roller bearing at a few lines of contact between the rollers and the surfaces of the journal and bearing. These points and lines however have an appreciable area due to the flexibility of all material and the consequent indentation of the small contact surface when pressure is applied. Therefore the load, which bearings of this kind carry, must not be great enough to cause indentation deeper than the elastic or fatigue limit of the material in the surface. In practice, these indentations are of microscopic, yet of measurable though negligible depth and area.

Roller Bearings, of the radial classification, having cylindrical rolls are the simplest form of the roller type. The axes of the rolls must be held perfectly parallel with the axis of the shaft,

but as this has not been found possible in a radial roller bearing, various methods have been used to overcome the effect of the skewed position of the rollers. One method is to make the roller flexible both as to diameter and straightness. The flexible roll takes the form of a spiral coil as exemplified in the Hyatt bearing, of which a roll is shown in fig. 12. Another method is to make the roll very short as in the Norma-Hoffman bearing, shown in fig. 13, guiding it between two ribs which are integral with the inner raceway. The outer raceway is rounded so as to make contact only near the centre of the roll. This is to protect the ends of the rollers against slight misalignment of the outer raceway. Radial roller bearings require a cage or retainer which is built of two or more parts. The load must be applied only in a radial direction, as the bearing has no end thrust capacity. A successful method of keeping the rollers in line with the shaft is exemplified in the tapered design of roller as in the Timken bearings. The surfaces of the rolls as well as of both races, when extended, form cones which have their apexes on a common point on the centreline of the shaft. The tapered shape of the roll causes it to press endwise against a rib provided on one of the races, usually the inner race or cone. The rib as well as the ends of the rolls have such contacting surfaces as will prevent skewing of rolls or misalignment.

FIG. 14.—CROSS SECTION VIEW OF TIMKEN TAPERED BEARING APPLICATION FOR RAILWAY PASSENGER EQUIPMENT. THIS BEARING CAN TAKE THRUST LOADS IN EITHER DIRECTION AS WELL AS THE VERTICAL AND RADIAL LOADS AND CAN BE ADJUSTED FOR ANY WEAR WHICH MAY OCCUR

There is no possibility of the endwise movement of rolls such as that existing in a straight roller bearing. The angle of the tapered roller bearing can be proportioned to obtain endwise thrust capacity of any desired ratio to its radial capacity. Perfect alignment of the rolls is thus obtained, resulting in a rolling contact along the entire length of the roll. The Timken tapered roller bearing is provided with a one-piece cage which acts as a roll spacer and as a retainer when the bearing is stored or handled. In the mounting of a roller bearing of this type two or more bearings are mounted on the shaft, with the tapers in opposite direction for holding the

adjusted running clearance, and for taking thrust load in either direction. The tapered roller bearing is adjustable for proper running clearance with liberal tolerances for dimensions of the finished parts surrounding the bearings. This feature is particularly valuable where tight fits must be used for securing the inner race of the bearing to the shaft. The inner race or cone is expanded because of the tight fit, which would cause pinching of

FIG. 15.—SHAFTER ROLLER BEARING, SHOWING INNER RACE WITH SPHERICAL FORM FOR PRODUCING A SELF-ALIGNING EFFECT

the rolls in bearings of the non-adjustable type. Close adjustment without pinching or cramping is desirable, because if a roller bearing has a large running clearance, the entire load may come on one roll. This applies also to ball bearings. Fig. 14 shows a phantom view of Timken tapered roller bearings as used on a large number of American railway passenger cars (see W. C. Sanders, *Journal of the American Society of Mechanical Engineers*, Dec. 1927). A modified form of roller bearing employing a barrel shaped roll is being made by the S K. F. Industries, Inc. The purpose of this form of roll is to permit a spherical surface in the outer race, a self-aligning feature. The cross-section of the inner race has a contour conforming to the shape of the roll, producing a slight slippage near the ends. Tangent lines drawn through the rolling contact points of the roll converge at a common point on the centreline of the shaft, similarly to the tapered roller bearing. This causes the roll to bear firmly against a rib on the inner race. The area of contact on this rib is also spherical and serves to prevent the roll from skewing out of line. A one-piece cage serves to space the rolls. Two sets of rolls opposing each other make up a self-contained bearing unit, each having a separate cage riding on the inner race. The running clearance between the rolls and races is large enough to allow for the expansion of the inner race when properly fitted on a shaft. The bearing is non-adjustable due to the use of one-piece races in a double-row bearing. Another modified form of roller is used in the Shafer roller bearing as shown in fig. 15. The inner race has a spherical form in order to produce a self-aligning effect. The roll makes contact with the inner race over a portion of the roll length. The roll therefore has a smaller diameter at its middle than toward the ends, thus producing considerable slippage. The rolls are held in alignment by means of a one-piece cage. The outer raceway has a convex curvature of cross-section to conform

FIG. 16.—AUBURN BALL BEARING, SHOWING DOUBLE CONTACT GROOVES TO OFFSET THE SPINNING EFFECT AT HIGH SPEEDS

nearly with the shape of the roll. Two sets of rolls opposing each other on the same inner race produce an adjustable self-contained bearing, each set of rolls having a separate cage and separate outer race. **Ball Bearings**, when subjected to a load between two surfaces, are deformed from their original shape—as is also the surface in contact with the balls—which produces an area of contact instead of point contact. This causes slippage on a portion of the surfaces as the ball rolls along. The nearest approach to a pure rolling motion of a ball is obtained in the single row bearing under radial load. Lines drawn tangent to the ball at the two contacts are parallel with the shaft. The capacity for carrying a load becomes maximum when the cross-sectional curvature of the raceway is made slightly larger in radius than that of the ball. The reason for this is that the area of contact increases as the curvature of ball and race are made more nearly coincident. Each

ball in a bearing of this construction can be loaded only at two points diametrically opposed to each other. When under radial load, the tangent lines through these points are parallel to the shaft, the ball is theoretically free from any spinning effect. This is the condition of minimum slippage. Centrifugal force has the effect of increasing the radial load on the balls and outer race and therefore does not introduce a disturbing force to cause spinning of the ball. When a deep groove ball bearing is subjected to thrust load parallel to the axis of the shaft, the tangent lines through the ball contacts are parallel to each other, but are not parallel to the shaft. The axis of ball rotation is therefore constantly changing position, causing a pivoting or spinning effect about the contact points. This accounts for the reduced capacity or durability of a ball when used in a thrust bearing. In fact, this is the principle used in the manufacture of a steel ball for grinding the finished surface. The ball is ground between two rotating discs, one of which has an abrasive surface. At high speeds,

FIG. 17—SECTION SHOWING LINES OF CONTACT IN A THRUST BEARING

FIG. 18.—DIAGRAMS OF SECTIONS OF DOUBLE ROLL BALL BEARINGS

- A. A double row rigid type without filling slot
- B. Bearing in which balls are inserted either through a slot or by eccentric race method
- C, D and E. Ball bearings that can have a maximum number of balls without the use of a filling slot

centrifugal force in a thrust bearing has the effect of moving the contact points off the diametric line. The spinning effect is therefore greatly increased. Some designers have attempted to overcome the spinning effect of a ball in a thrust bearing by providing

double contact grooves as shown in fig. 16 and fig. 17. Lines drawn through the contact points intersect at a point on the bearing. A commercial bearing based on this principle is made by the Auburn Ball Bearing Company. The areas at the contacts of the balls are however at a considerable angle with the axis of ball rotation, therefore, producing a pivoting effect in addition to the rolling motion. The Gurney type of single roll ball bearing permits the full circle to be filled with balls by

FIG. 19.—SECTION SHOWING RADIAL BALL BEARING DEFLECTED POSITION

omitting most of the rib on one side of the outer race. The outer race is sprung into position after heating it in oil. Thrust can be applied only in one direction

Double Row ball bearing, in which each row of balls is equally loaded by an external radial load, is shown in fig. 19. The bearing is not adjustable. A large number of balls can be used

because the outer race swings out of the way during assembly. A one-piece retainer cage is used to hold both rows of balls. Ball bearings of types shown in fig. 18 A, C and D can be given a maximum number of balls without the use of a filling slot. In fig. 18, A shows a double row rigid type without filling slot. The outer race is of two piece construction and held together by an enclosing shell. It is of the cup and cone principle, being partially adjustable. Each row of balls can receive thrust in one direction. In case of design fig. 18 B, thrust is taken in either direction by both sets of balls, but requires great accuracy in its manufacture. The balls in this bearing are inserted either through a slot which is later closed, or by the eccentric race method.

Ball and roller bearings need a small amount of lubrication in spite of the practical absence of friction. The pure rolling motion, as well as the contacts between the balls or rollers and their cages are benefited by the presence of lubricant. The inherent characteristics of a properly designed and produced ball or roller bearing are—durability, long life and continuity of service; simplicity in construction and operating principle; low frictional resistance and absence of any internal condition in the bearing or surrounding parts which is liable to produce rapid wear; and positiveness and cheapness of lubrication. (W. C. S.)

BEAR-LEADER, formerly a man who led bears about the country. In the middle ages and Tudor times these animals were used in the brutal sport of bear-baiting and were led from village to village; performing bears were also common. The phrase "bear-leader" has now come colloquially to mean a tutor or guardian, who escorts any lad of rank or wealth on his travels.

BEAR MOUNTAIN BRIDGE crosses the Hudson river about 44m. above New York city. It is a highway toll bridge, with a deck accommodating four lines of vehicles and two sidewalks. The floor system was designed for 15 ton and 20 ton motor trucks, with impact allowance. Opened to public use in November 1924, 18 months after work on it was started, it had what was at that time the longest suspension span in the world, 1,632ft. from centre to centre of the towers. It was completed early in 1925.

Each of the two cables contains 7,252 annealed steel galvanized wires, giving a diameter of 18½in.; from them stiffening trusses of "silicon" steel carrying the roadway over the main span are suspended by steel ropes passing over castings clamped to the cables. The trusses extend over the main span only, the roadway being carried on independent steel spans supported on concrete piers between the towers and the end of the bridge. The two towers are 355ft. high, built of structural steel with cast bases, and rest on four concrete piers founded on the natural rock on both shores, slightly above the water-level. The roadway and sidewalks are formed of a continuous reinforced concrete slab from railing to railing, with a roadway paving of sheet asphalt. Twelve expansion joints are provided in the main span. The bridge was designed and supervised by Howard C. Baird, with Francis P. Witmer as associate. It is owned by the Bear Mountain Hudson River

Bridge Company, but will become the property of the State of New York in 1955. (H. C. B.)

BEAR MOUNTAIN BRIDGE ROUTE connects New England with the West across the Hudson river just below the U.S. Military academy at West Point where the river narrows in passing through deep mountain cuts. The approach along Storm King highway affords magnificent views of the Hudson river.

BÉARN, formerly a small frontier province in the south of France, now included within the department of Basses-Pyrénées. It was bounded on the west by Soule and Lower Navarre, on the north by Chalosse, Tursan and Astarac, east by Bigorre and south by the Pyrenees. Its name can be traced back to the town of Benecharnum (Lescar). It was conquered by the Vascones in the 6th century and in 819 became a viscounty dependent on the

dukes of Aquitaine—a feudal link which was broken in the 11th century, when the viscounts ceased to acknowledge any suzerain. They then reigned over the two dioceses of Lescar and Oloron; but their capital was Morlaas, where they had a mint which was famous throughout the middle ages. In the 13th century Gaston VII., of the Catalonian house of Moncade, made Orthez his seat of government. His long reign (1220–90) was a perpetual struggle with the kings of France and England, each anxious to assert his suzerainty over Béarn. As Gaston left only daughters, the viscounty passed at his death to the family of Foix, from whom it was transmitted through the houses of Grailly and Albret to the Bourbons, and they, in the person of Henry IV., king of Navarre, made it an apanage of the crown of France. From the 11th century onward, the Béarnais were governed by their own special customs or *fors*. Moreover, from the 12th century Béarn enjoyed a kind of representative government, with *cours plénières* composed of deputies from the three estates. From 1220 onward, the judiciary powers of these assemblies were exercised by a *cour majour* of 12 *barons jurats* charged with the duty of maintaining the integrity of the *fors*. When Gaston-Phœbus wished to establish a regular annual hearth-tax (*fouage*) in the viscounty, he convoked the deputies of the three estates in assemblies called *états*. These soon acquired extensive political and financial powers, which continued in operation till 1789.

See Olhagaray, *Histoire de Foix, Béarn et Navarre* (1609); Pierre de Marca, *Histoire de Béarn* (1640), a work which does not go beyond the end of the 13th century, but contains a large number of documents; Faget de Baure, *Essais historiques sur le Béarn* (1818); *Les Fors de Béarn*, by Mazure and Hatoulet (1839) completed by J. Brissaud and P. Rogé in *Textes additionnels aux anciens Fors de Béarn* (1905); Léon Cadier, *Les États de Béarn depuis leur origine jusqu'au commencement du XVI^e siècle* (1888). (C. BEM.)

BEAS or **BIAS**, a river of India. The Beas, which was the Hyphasis of the Greeks, is one of the Five Rivers of the Punjab. It issues in the snowy mountains of Kulu at an altitude of 13,326ft. above sea-level, flows through the Kangra valley and the plains of the Punjab, and finally joins the Sutlej after a course of 290 miles.

BEAT, a blow or stroke; from the many applications of the verb "to beat" come various meanings of the substantive. It is applied to the throbbing of the pulse or heart and to the beating of a drum; in music to the alternating sound produced by the striking together of two notes not exactly of the same pitch (*see* SOUND), and to the movement of the baton by which a conductor of an orchestra or chorus indicates the time. In navigation a "beat" is one of the courses taken by a ship in sailing against the wind. The word is also applied to a policeman's or sentry's round.

BEAT FREQUENCY, the number of beats per unit of time. This frequency is equal to the difference between the frequencies of the combining waves.

BEATIFICATION, the act of making blessed; in the Roman Catholic Church a stage in the process of canonization (*q.v.*).

BEATON or **BETHUNE, DAVID** (c. 1494–1546), Scottish cardinal and archbishop of St. Andrews, was a younger son of John Beaton, of Balfour, in the county of Fife. He was educated at the universities of St. Andrews and Glasgow, and studied civil and canon law in Paris. About this time he was presented to the rectory of Campsie by his uncle James Beaton, then archbishop of Glasgow. When James Beaton was translated to St. Andrews in 1522 he resigned the rich abbacy of Arbroath in his nephew's favour. Beaton was sent by King James V. on various missions to France, and in 1528 was appointed keeper of the privy seal. He took a leading part in the negotiations connected with the king's marriages, first with Madeleine of France, and afterwards with Mary of Guise, and was consecrated bishop of Mirepoix by King Francis I. in Dec. 1537. On Dec. 20, 1538 he was appointed a cardinal priest by Pope Paul III., under the title of St. Stephen in the Coelian Hill, and on the death of Archbishop James Beaton in 1539 he was raised to the primatial see of Scotland.

Beaton used his influence over King James to draw closer the French alliance and refuse Henry VIII.'s overtures to follow him in his religious policy. On the death of James in Dec. 1542 he attempted to assume office as one of the regents for the infant sovereign, Mary, founding his pretensions on an alleged will of

the late king; but the earl of Arran was declared regent by the estates. The cardinal was, by order of the regent, committed to the custody of Lord Seaton; but he was soon again at liberty and at the head of the party opposed to the English alliance. Arran, too, was soon won over to his views, dismissed the Protestant preachers by whom he had been surrounded, and joined the cardinal at Stirling, where in Sept. 1543 Beaton crowned the young queen. In the same year he was raised to the office of chancellor of Scotland, and was appointed protonotary apostolic and legate *a latere* by the pope. His strenuous opposition to the plans of Henry VIII. for the subjugation of Scotland would have earned him the lasting gratitude of his countrymen, had not resistance to English influence involved resistance to the reformers in the Church, whose ultimate victory has obscured the cardinal's genuine merits as a statesman. The popular accounts of the persecution for which he was responsible are no doubt exaggerated, and it sometimes ceased for considerable periods. One of his most celebrated victims was George Wishart, an eloquent preacher who was protected by several barons of the English faction. These barons, with Wishart as a willing agent, were engaged in a plot to assassinate the cardinal who, perhaps, suspected Wishart's knowledge of it, and in any case was not sorry to have an excuse for getting him. For some time he was unsuccessful; but at last, with the aid of the regent, he arrested the preacher and carried him to his castle of St. Andrews. On Feb. 28, 1546, Wishart was brought to trial in the cathedral before the cardinal and other judges, the regent declining to take any active part, and, being found guilty of heresy, was condemned to death and burnt.

The death of Wishart produced a deep effect on the Scottish people, and the cardinal became an object of general dislike, which encouraged his enemies to proceed with the design they had formed against him. The conspirators, the chief of whom were Norman Leslie, master of Rothes, and William Kirkcaldy, of Grange, contrived to obtain admission into the castle at St. Andrews at daybreak on May 29, 1546, and murdered the cardinal under circumstances of horrible mockery and atrocity.

As a statesman Beaton was able, resolute, and in his general policy, patriotic. As an ecclesiastic he maintained the privileges of the hierarchy and the dominant system of belief conscientiously, but sometimes with cruelty. His immoralities, like his acts of persecution, were exaggerated by his opponents; but his private life was undoubtedly a scandal to religion. The authorship of the writings ascribed to him in several biographical notices rests on no better authority than the apocryphal statements of Thomas Dempster.

Beaton's uncle, JAMES BEATON, or BETHUNE (d. 1539), archbishop of Glasgow and St. Andrews, was lord treasurer of Scotland before he became archbishop of Glasgow in 1509, was chancellor from 1513–26, and was appointed archbishop of St. Andrews and primate of Scotland in 1522. He was one of the regents during the minority of James V., and was chiefly responsible for this king's action in allying himself with France and not with England. He burned Patrick Hamilton and other heretics.

This prelate must not be confused with another, JAMES BEATON or BETHUNE (1517–1603), the last Roman Catholic archbishop of Glasgow. A son of John Bethune, of Auchmuty, and nephew of Cardinal Beaton, James was a trusted adviser of the Scottish regent, Mary of Lorraine, widow of James V., and a determined foe of the reformers. In 1552 he was consecrated archbishop of Glasgow, but from 1560 until his death he lived in Paris, acting as ambassador for Scotland at the French court.

See John Knox, *Hist. of the Reformation in Scotland*, ed. D. Laing (1846–64); John Spottiswoode, archbishop of St. Andrews, *Hist. of the Church of Scotland* (Spottiswoode Soc., 1847–51); Art. in *Dict. of Nat. Biog.*, and works there quoted; and A. Lang, *Hist. of Scotland*, vols. i. and ii. (1900–02).

BEAT or **BEATING**. A beat is a complete cycle of pulsations produced when two or more periodic quantities of not greatly different frequencies react with each other to produce a resultant having pulsations of amplitude. Beating is an instance of this phenomenon (*see* SOUND).

BEATRICE, a city of Nebraska, U.S.A., 40m. S. of Lincoln, in the fertile valley of the Big Blue river, the county seat of Gage

county. It is on Federal highway 77, and is served by the Burlington, the Rock Island and the Union Pacific railways. The population in 1920 was 9,664.

Hydro-electric power is available, and the city is an important manufacturing centre. Its diversified products include silos, show-cases, mirrors, cultivators, steel tanks, hardware specialties, wind-mills and gasoline engines. There are large stone-quarries in the vicinity, and deposits of clay suitable for brick and earthenware. The State institution for the feeble minded is here. Beatrice was founded in 1857; the first railway reached it in 1871; and it was chartered as a city in 1873.

BEATTIE, JAMES (1735–1803), Scottish poet and writer on philosophy, was born at Laurencekirk, Kincardine. He was educated at the parish school and at Marischal college, Aberdeen, where, after some years spent in school teaching, he became professor of moral philosophy. Beattie's first published work was *Original Poems and Translations* (1760). In 1771 and 1774 he published the first and second parts of the *Minstrel*, a descriptive poem written in the Spenserian stanza, which struck a new note of simplicity and made its author famous. The best known of his minor poems are "The Hermit" and "Retirement." In the meantime Beattie wrote the once famous *Essay on the Nature and Immutability of Truth, in Opposition to Sophistry and Scepticism* (1770), which was a direct attack on Hume. Beattie visited London in 1773, and was well received by George III., who gave him a pension of £200 a year. He had many friends in London literary circles, including Johnson, Burke, Garrick and Goldsmith. His domestic life was unhappy. His wife became insane and his two sons died young. The elder, James Hay Beattie, was a poet, and his father published some of his prose and verse with a memoir in 1794.

Beattie's other poetical works include the *Judgment of Paris* (1765), and *Verses on the death of (Charles) Churchill*, a bitter attack which the poet afterwards suppressed. The best edition is the *Poetical Works* (1866) in the *Aldine Edition of the British Poets*, with an admirable memoir by Alexander Dyce. Beattie also wrote *Miscellaneous Dissertations* (1783), *Evidences of Christianity* (1786), and *Elements of Moral Science* (1790).

See Sir William Forbes, *An Account of the Life and Writings of James Beattie* (1807), *Beattie and his Friends* (1904) by the poet's great-grand-niece, Margaret Forbes; and James Beattie, "The Minstrel." *Some Unpublished Letters*, ed. A. Mackie (Aberdeen, 1908).

BEATTY, DAVID, 1ST EARL (1871–), British admiral of the fleet, was born on Jan. 17, 1871, second son of Captain David Longfield Beatty of County Wexford, Ireland. He entered the training ship "Britannia" as a naval cadet in 1884. As a young officer, from 1896–98, he saw service with the naval brigade in Egypt and the Sudan, for which he obtained the D.S.O. and early promotion to commander. In that rank he served in China during the Boxer Rebellion in 1900, when he again distinguished himself and was promoted to captain at the early age of 29.

In 1911, as a rear-admiral, he became naval secretary to the first lord of the Admiralty, then Winston Churchill, and, on completing two years in that office, in 1913 he was appointed to command the Battle Cruiser Squadron.

Very soon after the outbreak of the World War in Aug. 1914, his naval force made a raid into the Heligoland bight (*q.v.*) and sank three cruisers and one destroyer without loss. A few months later he intercepted the German squadron under Admiral von Hipper in their third attempt on the English coastal towns. In a running fight, the rear German battle cruiser "Blucher" was sunk by the British gunfire. Further damage to the enemy would probably have been inflicted but for the fact that the flagship "Lion" was disabled just as Beatty had swung his ships away from the reported position of an enemy submarine and that his second in command misunderstood his signal to renew the engagement, which was broken off. This action was known as the fight of the Dogger Bank (*q.v.*).

In the battle of Jutland (*q.v.*) on May 30, 1916, the battle cruiser fleet under Beatty was heavily engaged in a running fight with the German scouting force under von Hipper. Although Beatty's battle cruisers had the advantage of numbers, they were

handicapped by conditions of light, and the ships themselves proved unable to sustain the superior gunfire of the German battle cruisers, with the result that the "Indefatigable," "Queen Mary" and "Invincible" were sunk. The Fifth Battle Squadron, which was also part of Beatty's command, having been stationed five miles on the opposite bearing to that on which the enemy was sighted, were unable to render the powerful support which they could have given during the early part of the engagement. Nevertheless, Beatty succeeded in his main object of drawing the combined High Sea Fleet to the northward, from whence Admiral Jellicoe, with the whole British Grand Fleet, was hastening to meet and engage it. In Dec. 1916, on Jellicoe being appointed first sea lord, Beatty became commander-in-chief of the Grand Fleet. In this capacity he received the surrender of the greater part of the German navy after the Peace of Versailles.

From 1919 to 1927 he served with marked distinction and ability as first sea lord, having to deal with the exceptionally difficult problems connected with the reduction of the war fleet and the creation of a much smaller, modernized, but highly efficient peacetime navy. In 1921 he was the British delegate at the Washington Conference on the limitation of armaments.

He received the K.C.B. in 1914. In 1919 he was raised to the Peerage as Earl Beatty, Viscount Borodale of Borodale, Baron Beatty of the North Sea and of Brooksby, and received £100,000 for services during the war. He was also awarded the G.C.B. and the O.M. and was the recipient of numerous other British and foreign honours and decorations. In May 1901 he married Ethel, daughter of the late Marshall Field of Chicago, and has two sons. (E. A.)

BEATUS, of Valcavado, Spanish theologian and geographer, was born about 730, and died in 798. He took a prominent part in the Adoptionist controversy, and wrote against the views of Felix of Urgel, and his followers. About 776, he produced his *Commentaria in Apocalypsin* to which was attached one of the oldest Christian world-maps. This original map, which was probably intended to illustrate the distribution of the apostolic missions throughout the world (depicting the head of Peter at Rome, of Andrew in Greece, of Thomas in India, of James in Spain, and so forth) has survived only in 10 copies, varying in date from the 9th to the 13th century, the most valuable being that of "St. Sever" now at Paris, dating from c. 1030.

There is only one complete edition of the *Commentaria in Apocalypsin*, that by Florez (1770). The text of the Apocalypse used by Beatus has been edited by E. S. Buchanan (1915); see also Konrad Miller *Die Weltkarte des Beatus*; Heft 1 of *Mappamundi: die ältesten Weltkarten* (Stuttgart, 1895); d'Avezac in *Annales de . . . géographie* (June, 1870); Beazley, *Dawn of Modern Geography* (1897–1901).

BEAUCAIRE, town in France, department of Gard, 17m E. by S. of Nîmes on the P.L.M. railway. Pop. (1926), 6,691. Beaucaire is on the right bank of the lower Rhone, opposite Tarascon, with which it is connected by a suspension-bridge 1,476ft long, and by a railway bridge. A triangular keep, a small late Romanesque chapel and other remains of the castle (13th and 14th centuries) of the counts of Toulouse stand on the rocky pine-clad hill which rises abruptly from the Rhone and is cut off by a deep cleft landward. A great July fair, held here annually since the 12th century, is now of little importance save for leather goods (see FAIR). Beaucaire occupies the site of the ancient *Ugernum*, and several Roman remains have been discovered. The present name is derived from the mediaeval term *Bellum Quadrum*, used for the castle or its rock. In 1125 Beaucaire came into the possession of the counts of Toulouse, one of whom established the importance of its fairs by the grant of privileges. In the Wars of the League it suffered severely, and in 1632 its castle was destroyed by Richelieu. The Beaucaire canal communicates with Aigues-Mortes and the Canal du Midi. The town is an important river port, trading in wine and freestone.

BEAUCE (Lat. *Belsia*), a natural region of northern France, comprising portions of the departments of Eure-et-Loire and Loire-et-Cher, and also extending into Loiret and Seine-et-Oise. It has an area of over 2,800sq.m., its limits being defined by the course of the Essonne on the E., of the Loire on the S., and of the Brenne, the Loire and the Eure towards the W., though in the lat-

ter direction it extends somewhat beyond these boundaries. The Beauchamp is a treeless, dry, open plain of limestone formation; wind-mills and the spires in large nucleated villages at sources of water supply are the only prominent features of the landscape. Apart from the rivers on its borders, it is watered by insignificant streams. Clover and lucerne are grown and large flocks of sheep kept. It is renowned as a wheat land. Chartres (*q.v.*) is its historic and commercial focus.

BEAUCHAMP, ALPHONSE DE (1767–1832), French historian and writer, was born at Monaco in 1767, and died at Paris on June 3, 1832. In 1784 he entered a Sardinian regiment of marines, but on the outbreak of war with the French Republic he refused to fight in what he considered an unjust cause, and was imprisoned for several months. He then obtained a post in one of the government offices in Paris. On the fall of Robespierre, Beauchamp was transferred to the *bureau* of the minister of police and charged with the superintendence of the press. This situation opened up to him materials of which he made use in his first and most popular historical work, *Histoire de la Vendée et des Chouans* (1806). The third edition was confiscated; Beauchamp was deprived of his post, and in 1809 was compelled to leave Paris for a time.

Beauchamp's biographical and historical works dealing with contemporary events are valuable, owing to the sources at his disposal, but must be used with great caution. The following are worth mention:—*Vie Politique, militaire et privée du général Moreau* (1814); *Catastrophe de Murat, ou Récit de la dernière révolution de Naples* (1815); *Histoire de la guerre d'Espagne et du Portugal, 1807–1813* (1810); *Histoire de la révolution de Piémont* (1821, 1823); *Collection de mémoires relatifs aux révolutions d'Espagne* (1824); *Mémoires secrets et inédits pour servir à l'histoire contemporaine* (1825). The *Mémoires de Fouché* have also been ascribed to him, but it seems certain that he only revised and completed a work really composed by Fouché himself. See an article by Louis Madelin in *La Révolution française* (1900).

BEAUCHAMP (bē'chām), the name of several important English families. The baronial house of Beauchamp of Bedford was founded at the Conquest by Hugh de Beauchamp, who received a barony in Bedfordshire. His eldest son Simon left a daughter, whose husband Hugh (brother of the count of Meulan) was created earl of Bedford by Stephen. But the heir-male, Miles de Beauchamp, nephew of Simon, held Bedford castle against the king in 1137–38. From his brother Payn descended the barons of Bedford, of whom William held Bedford castle against the royal forces in the struggle for the Great Charter, and was afterwards made prisoner at the battle of Lincoln, while John, who sided with the barons under Simon de Montfort, fell at Evesham. With him the line ended, but a younger branch was seated at Eaton Socon, Bedfordshire, where the earthworks of their castle remain, and held their barony there into the 14th century.

The Beauchamps of Elmley, Worcestershire, the greatest house of the name, were founded by the marriage of Walter de Beauchamp with the daughter of Urise d'Abetot, a Domesday baron, which brought him the shrievalty of Worcestershire, the office of a royal steward, and large estates. His descendant William, of Elmley, married Isabel, sister and eventually heiress to William Mauduit, earl of Warwick, and their son succeeded in 1268 to Warwick castle and that earldom, which remained with his descendants in the male line till 1445.

The earls of the Beauchamp line played a great part in English history. Guy, the 2nd, distinguished himself in the Scottish campaigns of Edward I., who warned him at his death against Piers Gaveston. Under Edward II. he was one of the foremost foes of Piers, who had styled him "the black cur of Arden," and with whose death he was closely connected. As one of the "lords ordainers" he was a recognized leader of the opposition to Edward II. By the heiress of the Tonis he left at his death in 1315 a son Earl Thomas, who distinguished himself at Crécy and Poitiers, was marshal of the English host, and, with his brother John, one of the founders of the order of the Garter. In 1369 his son Earl Thomas succeeded; from 1376 to 1379 he was among the

lords striving for reform, and in the latter year he was appointed governor to the king. Under Richard II. he joined the lords appellant in their opposition to the king and his ministers, and was in power with them 1388–89; treacherously arrested by Richard in 1397, he was imprisoned in the Tower of London (the Beauchamp Tower being called after him), but liberated by Henry IV. on his triumph (1399). In 1401 he was succeeded by his son Earl Richard, who defeated Owen Glendower, fought the Percys at Shrewsbury, and, after travelling in state through Europe and the Holy Land, was employed against the Lollards and afterwards as lay ambassador from England to the council of Constance (1414). He held command for a time at Calais, and took part in the French campaigns of Henry V., who created him earl and count of Aumale in Normandy. He had charge of the education of Henry VI., and in 1437 was appointed lieutenant of France and of Normandy.

Dying at Rouen in 1439, he left by Isabel, widow of Richard Beauchamp, earl of Worcester, a son, Earl Henry, who was created duke of Warwick, 1445, and is alleged, but without authority, to have been crowned king of the Isle of Wight by Henry VI. He died, the last of his line, in June 1445. On the death of Anne, his only child, in 1440, his vast inheritance passed to Anne, his sister of the whole blood, wife of Richard Neville, earl of Salisbury ("the kingmaker"), who thereupon became earl of Warwick.

Of the cadet branches of the house, the oldest was that of Powyke and Alcester, which obtained a barony in 1447 and became extinct in 1496; from it sprang the Beauchamps Lords St. Amand from 1448, of whom was Richard, bishop of Salisbury first chancellor of the order of the Garter, and who became extinct in 1508, being the last known male heirs of the race. Another cadet was Sir John Beauchamp of Holt, minister of Richard II., who was created Lord Beauchamp of Kidderminster (the first baron created by patent) 1387, but beheaded 1388; the barony became extinct with his son in 1400. Roger, Lord Beauchamp of Bletsoe, summoned in 1363, is said to have been descended from the Powyke branch; his line ended early in the 15th century. Later cadets were John, brother of the 3rd earl, who carried the standard at Crécy, became captain of Calais, and was summoned as a peer in 1350, but died unmarried; and William, brother of the 4th earl, who was distinguished in the French wars, and succeeding to the lands of the Lords Abergavenny was summoned in that barony 1392; his son was created earl of Worcester in 1420, but died without male issue in 1422; from his daughter, who married Sir Edward Neville, descended the Lords Abergavenny.

The Lords Beauchamp of "Hache" (1290–1361) were so named from their seat of Hatch Beauchamp, Somersetshire, and were of a wholly distinct family. Their title, "Beauchamp of Hache," was revived for the Seymours in 1536 and 1559. The title of "Beauchamp of Powyke" was revived as a barony in 1806 for Richard Lygon (descended through females from the Beauchamps of Powyke), who was created Earl Beauchamp in 1815.

BEAUFORT, HENRY (c. 1377–1447), English cardinal and bishop of Winchester, was the second son of John of Gaunt, duke of Lancaster, by Catherine, wife of Sir Hugh Swynford. His parents were not married until 1396, and in 1397 King Richard II. declared the four children of this union to be legitimate. Henry entered the Church, and was consecrated bishop of Lincoln in 1398. He was made chancellor in 1403, but resigned this office in 1404, when he was translated from Lincoln to Winchester as the successor of William of Wykeham. He exercised considerable influence over the prince of Wales, afterwards King Henry V., and, although he steadily supported the house of Lancaster, he opposed the party led by Thomas Arundel, archbishop of Canterbury. A dispute over money left by John Beaufort, marquess of Dorset, caused or widened a breach in the royal family, which reached a climax in 1411. The details are not quite clear, but it

seems tolerably certain that the prince and the bishop, anxious to retain their power, sought to induce Henry IV. to abdicate in favour of his son. Angry at this request, the king dismissed his son from the council, and Beaufort appears to have shared his disgrace. When Henry V. ascended the throne, in 1413, the bishop again became chancellor, and took a leading part in the Government until 1417, when he resigned his office, and proceeded to the council which was then sitting at Constance. His arrival had an important effect on the deliberations of this council, and the compromise which was subsequently made between the rival parties was largely his work. Grateful for Beaufort's services, the new pope, Martin V., offered him a cardinal's hat, which Henry V. refused to allow him to accept. After the king's death in 1422 he became a member of the council, and was the chief opponent of the wild and selfish schemes of Humphrey, duke of Gloucester. In 1424 he became chancellor for the third time, and was mainly responsible for the conduct of affairs during Gloucester's expedition to Hainaut. He was disliked by the citizens of London; and this ill-feeling was heightened when Gloucester, who was a favourite of the Londoners, returned to England and was doubtless reproached by Beaufort for the folly of his undertaking. A riot took place in London, and at the bishop's entreaty, the protector, John, duke of Bedford, came back to England. As this dispute was still unsettled when the Parliament met at Leicester in Feb. 1426, Bedford and the lords undertook to arbitrate. Charged by Gloucester with treason against Henry VI. and his successors, Beaufort denied the accusations, but he resigned the chancellorship.

Anxious to secure his aid for the crusade against the Hussites, Pope Martin again offered him a cardinal's hat, which Beaufort accepted. He went to France in 1427, and was then appointed papal legate for Germany, Hungary and Bohemia; and proceeding eastwards, he made a bold but futile effort to rally the crusaders at Tachau. Returning to England to raise money for a fresh crusade, he was received with great state in London; but his acceptance of the cardinalate had weakened his position, and Gloucester refused to recognize his legatine commission. Beaufort gave way on this question, but an unsuccessful attempt was made in 1429 to deprive him of his see. Having raised some troops he set out for Bohemia; but owing to the disasters which had just attended the English arms in France, he was induced to allow these soldiers to serve in the French war, and in Feb. 1431 the death of Martin V. ended his commission as legate. He accompanied King Henry VI. to Normandy in April 1430, and in Dec. 1431 crowned him king of France. About this time Gloucester made another attempt to deprive Beaufort of his see, and it was argued in the council that, as a cardinal, he could not hold an English bishopric. The general council was not inclined to press the case against him; but the privy council, more clerical and more hostile, sealed writs of praemunire and attachment against him, and some of his jewels were seized. On his return to England he attended the Parliament in May 1432, and asked to hear the charges against him. The king declared him loyal, and a statute was passed freeing him from any penalties which he might have incurred under the Statute of Provisors or in other ways. He supported Bedford in his attempts to restore order to the finances. In Aug. 1435 he attended the congress at Arras, but was unable to make peace with France; and after Bedford's death his renewed efforts to this end were again opposed by Gloucester, who favoured a continuance of the war. On two occasions the council advised the king to refuse him permission to leave England, but in 1437 he obtained a full pardon for all his offences. In 1439 and 1440 he went to France on missions of peace, and, apparently at his instigation, the English council decided to release Charles, duke of Orleans. This step further irritated Gloucester, who drew up and presented to the king a long and serious list of charges against Beaufort; but the council defended the policy of the cardinal, and ignored the personal accusations against him. Beaufort, however, gradually retired from public life, and after witnessing the conclusion of the Treaty of Troyes died at Wolvesey palace, Winchester. The "black despair" which Shakespeare has cast round his dying hours appears to be without

historical foundation. He was buried in Winchester cathedral, the building of which he finished. He also refounded and enlarged the hospital of St. Cross near Winchester.

Beaufort was a man of considerable wealth, and on several occasions he lent large sums of money to the king. His interests were secular, and he was certainly proud and ambitious; but Stubbs has pictured the fairer side of his character when he observes that Beaufort "was merciful in his political enmities, enlightened in his foreign policy; that he was devotedly faithful, and ready to sacrifice his wealth and labour for the king; that from the moment of his death everything began to go wrong, and went worse and worse until all was lost."

Riley (1854); W. Stubbs, *Constitutional History*, vol. iii. (1895); M. Creighton, *A History of the Papacy during the Period of the Reformation* (1897); and L. B. Radford, *Henry Beaufort* (1908).

BEAUFORT, FRANÇOIS DE VENDÔME, DUC DE (1610-1669), a picturesque figure in French history of the 17th century, was the second son of César de Vendôme, and grandson of Henry IV. by Gabrielle d'Estrées. He served in the first campaigns of the Thirty Years' War. In 1642 he joined in the conspiracy of Cinq Mars against Richelieu, and upon its failure was obliged to live in exile in England until Richelieu's death. Returning to France, he became the centre of a group, known as the "Importants," in which court ladies predominated, especially the duchess of Chevreuse and the duchess of Monthazon. For an instant after the king's death, this group seemed likely to prevail, but Mazarin came to the fore, and Beaufort, accused of a plot to murder Mazarin, was imprisoned in Vincennes, in Sept. 1643. He escaped on May 31 1648, just in time to join the Fronde, which began in Aug. 1648. He was then with the parlement and the princes, against Mazarin. His personal appearance, his affectation of popular manners, his quality of grandson (legitimized) of Henry IV., rendered him a favourite of the Parisians, who called him the *Roi des Halles* ("king of the markets"). But among the members of the parlement and the other leaders of the Fronde, he was regarded as merely a tool. Mazarin, on his return to Paris, exiled him in Oct. 1652. He was allowed to return in 1654 and engaged in no further intrigues. From 1658 onwards he faithfully served the king in naval wars. He was killed in a night sortie while defending Candia against the Turks on June 15 1669.

See the memoirs of the time, notably those of La Rochefoucauld, the Cardinal de Retz, and Madame de Motteville. Also D'Avenel, *Richelieu et la monarchie absolue* (1884), Cheruel, *La France sous le ministère de Mazarin* (1879); and *La France sous la minorité de Louis XIV.* (1882).

BEAUFORT, the name of the family descended from the union of John of Gaunt, duke of Lancaster, with Catherine, wife of Sir Hugh Swynford, taken from a castle in Anjou which belonged to John of Gaunt. There were four children of this union—John, created earl of Somerset and marquess of Dorset; Henry, afterwards bishop of Winchester and cardinal (see **BEAUFORT, HENRY**); Thomas, made duke of Exeter and chancellor; and Joan, who married Ralph Neville, first earl of Westmorland, and died in 1440. In 1396, some years after the birth of these children, John of Gaunt and Catherine were married, and in 1397 the Beauforts were declared legitimate by King Richard II. In 1407 this action was confirmed by their half-brother, King Henry IV., but on this occasion they were expressly excluded from the succession to the English throne.

JOHN BEAUFORT, earl of Somerset (c. 1373-1410), assisted Richard II. in 1397 when the king attacked the lords appellants and made himself an absolute ruler. For these services he was made marquess of Dorset, but after the deposition of Richard, in 1399, he was degraded to his former rank as earl. In 1401, however, he was declared loyal, and appeared later in command of the English fleet. He married Margaret, daughter of Thomas Holland, second earl of Kent, and died in March 1410, leaving three sons, Henry, John, and Edmund, and two daughters, Jane or Joan, who married James I., king of Scotland, and Margaret, who married Thomas Courtenay, earl of Devon.

THOMAS BEAUFORT (d. 1426) held various high offices under Henry IV., and took a leading part in suppressing the rising in the north in 1405. He became chancellor in 1410, but resigned this office in Jan. 1412 and took part in the expedition to France in the same year. In 1416 he became lieutenant of Normandy and was created duke of Exeter; and returning to England he compelled the Scots to raise the siege of Roxburgh. Crossing to France in 1418 with reinforcements for Henry V., he took an active part in the subsequent campaign, was made captain of Rouen, and went to the court of France to treat for peace. He was then captured by the French at Bauge, but was released, and returned to England when he heard of the death of Henry V. in Aug. 1422. He was one of Henry's executors, and it is probable that the king entrusted his young son, King Henry VI., to his care. However this may be, Exeter did not take a very prominent part in the government, although he was a member of the council of regency. Having again shared in the French war, the duke died at Greenwich about the end of the year 1426.

JOHN BEAUFORT (1403-1444), earl, then duke, of Somerset, fought under Henry V. in the French wars, and having been taken prisoner remained in France as a captive until 1437. After the death of Richard Beauchamp, earl of Warwick, in 1439, he commanded the English forces, and, with his brother Edmund, was successful in recapturing Harfleur. Although chagrined when Richard, duke of York, was made regent of France, Beaufort led an expedition to France in 1442, and in 1443 was made duke of Somerset. He died, probably by his own hand, in May 1444. He married Margaret, daughter of Sir John Beauchamp, and left a daughter, **MARGARET BEAUFORT**, afterwards countess of Richmond and Derby, who married, for her first husband, Edmund Tudor, earl of Richmond, by whom she became the mother of King Henry VII.

The title of earl of Somerset descended on the death of John Beaufort in 1444 to his brother **EDMUND BEAUFORT**, duke of Somerset (q.v.), who was killed at St Albans in 1455. By his marriage with Eleanor Beauchamp, daughter of the fifth earl of Warwick, he left three sons, Henry, Edmund, and John, and a daughter, Margaret, who married Humphrey, earl of Stafford.

HENRY BEAUFORT (1436-1464) became duke of Somerset in 1455, and soon began to take part in the struggle against Richard, duke of York, but failed to dislodge Richard's ally, Richard Neville, earl of Warwick, from Calais. He took part in the victory of the Lancastrians at Wakefield in 1460, escaped from the carnage at Towton in 1461, and shared the attainder of Henry VI. in the same year. In May 1464 he was captured at Hexham and was beheaded immediately after the battle. The title of duke of Somerset was assumed by his brother, **EDMUND BEAUFORT** (c. 1438-1471), who fled from the country after the disasters to the Lancastrian arms, but returned to England in 1471, in which year he fought at Tewkesbury, and in spite of a promise of pardon was beheaded after the battle on May 6, 1471. His younger brother **JOHN BEAUFORT** was killed probably at this battle, and so on the execution of Edmund the family became extinct.

See Thomas Walsingham, *Historia Anglicana*, edited by H. T. Riley (1803-64); W. Stubbs, *Constitutional History of England*, vols. ii. and iii. (Oxford, 1895); *The Paston Letters*, edited by James Gairdner (1904).

BEAUFORT, LOUIS DE (d. 1795), French historian, wrote a *Dissertation sur l'incertitude des cinq premiers siècles de l'histoire romaine* (Utrecht, 1738), an indictment, bold for its time, of traditional history such as Rollin was writing at that very moment. Beaufort also wrote an *Histoire de César Germanicus* (Leyden, 1701), and *La République romaine, ou plan général de l'ancien gouvernement de Rome* (The Hague, 1766).

BEAUFORT, a town of South Carolina, U.S.A., 60m. west-south-west of Charleston, on Port Royal island, 14m. from the ocean, and served by the Charleston and Western Carolina railway; a port of entry and the county seat of Beaufort county. The population in 1920 was 2,831 (55% negroes). Beaufort is a charming winter resort with a good harbour and considerable traffic in pine and cypress lumber, rosin, oyster shells, oysters,

shrimp and canned vegetables. There are immense turtle farms in the vicinity and market gardening is carried on extensively. Fig trees grow here, the most northerly point in the eastern United States at which they can be cultivated. On Paris island, near by, is a station of the U.S. Marine Corps, with a personnel of 2,000 men. Jean Ribaut, on May 27, 1562, sailed into the harbour, which he named Port Royal, and established a settlement, probably on Paris island, which lasted but a few weeks. In 1710 the first permanent settlement by the English was made on Port Royal island, and was named after Henry Somerset, duke of Beaufort. For a brief period early in 1779 the island was occupied by the British. It was fortified by the Confederates at the beginning of the Civil War, but they were driven out on Nov. 7, 1861, and after that the harbour was used as a coaling and repair station by the Federal blockading squadron. In 1862 a group of northerners organized the "Port Royal experiment," a successful effort, subsidized by the Government, to work the deserted cotton plantations with paid negro labour.

BEAUFORT SCALE, a series of numbers from 0 to 12 arranged by Admiral Sir Francis Beaufort (1774-1857) in 1806, to indicate the strength of the wind from a calm, force 0, to a hurricane, force 12, "that which no canvas could withstand." The British Admiralty accepted the scale for the open sea in 1838 and it was adopted in 1874 by the International Meteorological Committee for international use in weather telegraphy. The Beaufort scale as originally drawn up made no reference to the velocity of the wind and various attempts, particularly during the present century, have been made to correlate the two. One such correlation, determined in 1906 by the Meteorological Office is shown below. The Deutsche Seewarte table differs appreciably from this, particularly in the higher part of the scale. An attempt to systematize the scales led to a request to Dr. Simpson in 1921 for a definite scale. His conclusions published in 1926 suggest *inter alia* that there is no unique relationship between wind velocity as recorded by anemometers and estimates made on the Beaufort scale.

Beaufort scale.	Corresponding wind.	Limits of hourly velocity.
Numbers.		Statute ml. per hour.
0	Calm	Under 2
1-3	Night breeze	2-12
4-5	Moderate wind	13-23
6-7	Strong wind	24-37
8-9	Gale	38-55
10-11	Storm	56-75
12	Hurricane	Above 75

BEAUFORT SEA is that part of the Arctic sea that lies between Alaska and the Canadian Arctic islands. It is shallow to the south and east, but to the north-west deepens to 1,600 fathoms or more. It is generally covered with drifting ice and has not been penetrated by any ship although many vessels have navigated its Alaskan border in summer. S. Storkersen (1918) and D. Macmillan (1914) have travelled over its ice and Amundsen and Nobile (1926) and G. H. Wilkins (1927 and 1928) have flown over it, but many parts of the sea are unexplored. No land is believed to lie within its area. (See ARCTIC REGIONS)

BEAUFORT WEST, a town in South Africa, 339m. by rail from Cape Town, 2,792ft. above sea-level, at the foot of the Nieuwveld mountains. Pop. (1921) 3,004 whites, 3,136 coloured. It is the largest town in the western part of the Great Karroo. Owing to its dry climate it is recommended as an invalid resort. It has a good water supply from springs and from a reservoir, which has a capacity of 700,000,000 gallons. The town is surrounded by orchards and fields, and many of the streets are bordered with quince hedges. It was founded in 1819 and used to do a considerable trade with Bechuana and Griqua in ivory, skins and cattle.

The magisterial division of Beaufort West has an area of 6,374 sq. miles. The rainfall is about ten inches. Agriculture is impossible without irrigation; and the production and sale of wool are the chief occupations of the inhabitants of both town and district.

BEAUGENCY, town of France, department of Loiret, 16mp. S.W. of Orléans on the Orléans railway. Pop. (1926), 2,804. It is at the foot of vine-clad hills on the right bank of the Loire, crossed by a bridge of 26 arches dating in part from the 13th century. The lords of Beaugency were powerful from the 11th to the 13th centuries, when the fief was sold to the Crown, afterwards passing to the house of Orléans. Joan of Arc defeated the English here in 1429. In 1567 the town was sacked and burned by the Protestants. In Dec. 1870 the German army defeated the French army of the Loire near the river north-west of Beaugency. The chief buildings are the château (mainly 13th century) with a massive (11th century) donjon, and the abbey-church of Notre-Dame, Romanesque but frequently restored. Portions of the Benedictine abbey, to which this church belonged, remain. The hôtel-de-ville, with a decorated Renaissance façade, the church of St. Etienne (pure Romanesque), and several old houses are of interest. The town carries on trade in grain, and has flour mills.

BEAUHARNAIS, EUGÈNE DE (1781-1824), stepson of Napoleon I., was born in Paris on Sept. 3, 1781, the son of the general Viscount Alexandre de Beauharnais (1760-94) and Josephine Tascher de la Pagerie. The father, who was born in Martinique, and served in the American War of Independence, took part in the politics of the French Revolution, and in June-Aug. 1793 commanded the army of the Rhine. He was guillotined (June 23, 1794) not long before the fall of Robespierre. The marriage of his widow Josephine to Napoleon Bonaparte in March 1796 was at first resented by Eugène and his sister Hortense; but their step-father proved to be no less kind than watchful over their interests. In the Italian campaigns of 1796-97 Eugène served as aide-de-camp to Bonaparte, and accompanied him to Egypt in the same capacity. He was wounded during the siege of Acre. The intervention of Eugène and Hortense helped to bring about the reconciliation which took place in 1799 between Bonaparte and Josephine. The services rendered by Eugène at the time of the *coup d'état* of Brumaire (1799) and during the Consulate (1799-1804) established his fortunes.

After the proclamation of the Empire, Eugène received the title of prince, with a yearly stipend of 200,000 francs, and became general of the *chasseurs à cheval* of the Guard. A year later Eugène received the title of viceroy of Italy with large administrative powers. In the campaign of 1809 Eugène commanded the army of Italy, with General (afterwards Marshal) Macdonald as his *adlatus*. The battle of Sacile, where he fought against the Austrian Army of the Archduke John, did not yield proofs of military talent on the part of Eugène or of Macdonald; but on the retreat of the enemy into Austrian territory (owing to the disasters of their main army on the Danube) Eugène's forces pressed them vigorously and finally won an important victory at Raab in the heart of the Austrian empire. Then, joining the main army under Napoleon, on the island of Lobau in the Danube, near Vienna, Eugène and Macdonald acquitted themselves most creditably in the great battle of Wagram, July 6, 1809. He and his Italian contingent distinguished themselves especially at the battles of Borodino and Malojarslavitz in 1812; and Eugène's soldierly constancy and devotion to Napoleon shone out conspicuously in 1813-14, especially by contrast with the tergiversations of Murat. On the downfall of Napoleon Eugène retired to Munich, where he continued to reside, with the title duke of Leuchtenberg and prince of Eichstädt. He died in 1824, leaving two surviving sons and three daughters by his wife Augusta of Bavaria.

For further details concerning Eugène see F. J. A. Schneidewind, *Prinz Eugen, Herzog von Leuchtenberg in den Feldzügen seiner Zeit* (1857); *Mémoires et correspondance politique et militaire du Prince Eugène*, edited by Baron A. Ducasse (1858-60); A. Pultitzer, *Une Idylle sous Napoléon 1^{er}: le roman du Prince Eugène* (1895); F. Masson, *Napoléon et sa famille* (1897-1900).

BEAUHARNAIS, the name of a French family, well known from the 15th century onward in Orléanais. One of them, Jean Jacques de Beauharnais, seigneur de Miramion, had for wife Marie Bonneau, who in 1661, founded a female charitable order, called after her the Miramiones. François de Beauharnais, marquis de la Ferté-Beauharnais, was a deputy in the states general of 1789, and a devoted defender of the monarchy. He emigrated and

served in Condé's army. Later he gave his adherence to Napoleon, and became ambassador in Etruria and Spain; he died in 1823. His brother Alexandre, vicomte de Beauharnais, married Josephine Tascher de la Pagerie (afterwards the wife of Napoleon Bonaparte) and had two children by her—Eugène de Beauharnais (q.v.) and Hortense, who married Louis Bonaparte, king of Holland, and became mother of Napoleon III. Claude de Beauharnais comte des Roches-Baritaud, uncle of the marquis and of the vicomte de Beauharnais, served in the navy and became a vice-admiral. He married Marie Anne François (called Fanny) Mouchard, a woman of letters who had a celebrated salon. His son, also named Claude (d. 1819), was created a peer of France in 1814, and was the father of Stéphanie de Beauharnais, who married the grand-duke of Baden. (M P.)

BEAUJEU. The French province of Beaujolais was formed by the development of the ancient seigniorie of Beaujeu (department of Rhône, arrondissement of Villefranche). The lords of Beaujeu held from the 10th century onwards a high rank in feudal society. In 1210 Guichard of Beaujeu was sent by Philip Augustus (q.v.) on an embassy to Pope Innocent III; he was present at the French attack on Dover, where he died in 1216. His son Humbert took part in the wars against the Albigenses (q.v.) and became constable of France. Isabeau, daughter of this Humbert, married Renaud, count of Forez; and their second son, Louis, assumed the name and arms of Beaujeu. His son Guichard, called the Great, had a very warlike life, fighting for the king of France, for the count of Savoy and for his own hand. Guichard's son, Edward of Beaujeu, marshal of France, fought at Crécy, and perished in the battle of Ardres in 1351. His son died without issue in 1374, and was succeeded by his cousin, Edward of Beaujeu, lord of Perreux, who gave his estates of Beaujolais and Dombes to Louis II., duke of Bourbon, in 1400. Pierre de Bourbon was lord of Beaujeu in 1474, when he married Anne of France, daughter of Louis XI., and this is why that princess was called "lady of Beaujeu." Louise of Savoy, mother of Francis I., got Beaujolais assigned to herself despite the claims of the constable de Bourbon. In 1531 the province was reunited to the crown; but Francis II. gave it back to the Montpensier branch of the Bourbons in 1560, from which house it passed to that of Orleans. The title of comte de Beaujolais was borne by a son of Philippe "Égalité," duke of Orleans.

BEAULY (pronounced *Bewley*; a corruption of *Beaulieu*), town in Inverness-shire, Scotland, on the Beauly in Kilmorack parish, 12m. W. of Inverness by the LMS railway. Pop. (1921), 805. Its chief interest is the beautiful remains of the Priory of St. John, founded in 1230 by John Bisset of the Aird, for Cistercian monks. On the right bank of the river is the site of Lovat Castle, which once belonged to the Bissets, but was presented by James VI. to Hugh Fraser and afterwards demolished. The church of Kirkhill to the south-east contains the Lovat vault. Three miles south of Beauly is the modern Beaufort Castle, the chief seat of the Lovats, on the site of a fortress of the time of Alexander II. This was replaced by several castles in succession, of which one—Castle Dounie—was taken by Cromwell and burned by the duke of Cumberland in 1746.

BEAUMANOIR, PHILIPPE DE RÉMI, SIRE DE (d. 1296), French jurist, was born in the early part of the 13th century. The few facts known regarding him are gathered from legal documents: it appears that in 1273 he held the post of *bailli* at Senlis, and in 1280 a similar office at Clermont; he also presided at assizes held at various towns. His chief work, *Coutumes de Beauvoisis* (1690). It is one of the best works of old French law, and was much admired by Montesquieu. Beaumanoir was also a poet, and left over 20,000 verses: among his poems are "La Manekine," "Jehan et Blonde," and "Salut d'Amour."

BEAUMANOIR, a seigniorie in what is now the department of Côtes-du-Nord, France, which gave its name to an illustrious family. Jean de Beaumanoir, marshal of Brittany for Charles of Blois, and captain of Josselin, is remembered for his share in the famous battle of the Thirty. This battle, sung by an unknown trouvère and retold with variations by Froissart, was an episode in the struggle for the succession to the duchy of Brittany.

between Charles of Blois, supported by the king of France, and John of Montfort, supported by the king of England. John Bramborough, the English captain of Ploërmel, having continued his ravages, in spite of a truce, in the district commanded by the captain of Josselin, Jean de Beaumanoir sent him a challenge, which resulted in a fight between 30 picked champions, knights and squires, on either side, which took place on March 25, 1351, near Ploërmel. Beaumanoir commanded 30 Bretons, Bramborough a mixed force of 20 Englishmen, six German mercenaries and four Breton partisans of Montfort. The battle, fought with swords, daggers and axes, was of the most desperate character, in its details very reminiscent of the last fight of the Burgundians in the *Nibelungenlied*, especially in the celebrated advice of Geoffroy du Bois to his wounded leader, who was asking for water: "Drink your blood, Beaumanoir; that will quench your thirst!" In the end the victory was decided by Guillaume de Montauban, who mounted his horse and overthrew seven of the English champions, the rest being forced to surrender. All the combatants on either side were either dead or seriously wounded, Bramborough being among the slain. The prisoners were well treated and released on payment of a small ransom. (See *Le Poème du combat des Trente*, in the *Panthéon littéraire*; Froissart, *Chroniques*, ed. S. Luce, c. iv. pp. 45 and 110 ff., and pp. 338-340.)

BEAUMARCHAIS, PIERRE AUGUSTIN CARON DE (1732-1799), French dramatist, was the son of a Paris watchmaker named Caron and at the age of 21 invented a new escapement for watches, which was pirated. The affair brought him into notice at court; he was appointed watchmaker to the king, who ordered from him a watch similar to one he had made for Mme. de Pompadour. Mme. Franquet, the wife of an old court official, persuaded her husband to make over his office to young Caron, and, on her husband's death, a few months later, married the handsome watchmaker. Caron then assumed the name Beaumarchais; and four years later, by purchasing the office of secretary to the king, obtained a patent of nobility.

Beaumarchais's first play was the sentimental drama *Eugénie* (1767), and this was followed by *Les Deux Amis*. His first wife had died within a year of the marriage, and in 1768 he married Mme. Lévêque. Meanwhile he had been sharing in the speculations of the great banker, Joseph Duverney, who, some time before his death in 1770, drew up a settlement acknowledging himself debtor to Beaumarchais for 15,000 francs. Duverney's heir, the comte de la Blache, denied the validity of the document; the matter was put to trial, Beaumarchais gained his cause, but his adversary at once carried the case before the parlement. Beaumarchais was unable to obtain an interview with Goezman, the member of the parlement appointed to report on his case, but at last, just before the day on which the report was to be given in, he was informed privately that, by presenting 200 *louis* to Mme. Goezman and 15 to her secretary, the desired interview might take place; if the result should prove unfavourable the money would be refunded. The decision was adverse, and 200 *louis* were returned, the 15 going as business expenses to the secretary. Beaumarchais, who had learned that there was no secretary save Mme. Goezman herself, insisted on restitution of the 15 *louis*, but the lady denied all knowledge of the affair. Her husband doubtless thought the defeated litigant would be easily put down, and brought an accusation against him for an attempt to corrupt justice. The battle was fought chiefly through the *Mémoires*, or reports published by the adverse parties, and for vivacity of style Beaumarchais's famous *Mémoires* have never been surpassed. He was condemned to civic degradation, and reduced to great straits for two years, when he obtained restitution, and finally triumphed, becoming at the same time something of a popular hero.

During the next few years he was engaged in the king's secret service. He succeeded in inducing the French Government to give ample, though private, assistance in money and arms to the American colonists in their struggle with Great Britain. He himself carried on an enormous traffic with America under the name of Rodrique Hortalez et Cie, employing a fleet of 40 vessels to provide help for the insurgents.

During the same period he produced his two famous comedies. The earlier, *Le Barbier de Séville*, after a prohibition of two years, was put on the stage in 1775. The first representation was a complete failure; but Beaumarchais cut down and remodelled the piece in time for the second representation, when it achieved a complete success. The second and more famous comedy, *Le Mariage de Figaro*, was completed in 1778, but much difficulty was experienced in getting a licence for it, and the opposition of Louis XVI., who alone saw its dangerous tendencies, was not overcome till 1784. The comedy had an unprecedented success. To English readers the Figaro plays are generally known through the adaptations of them in the grand opera of Mozart and Rossini. The court looked on at a play justly characterized by Napoleon as the "Revolution already in action" apparently without a suspicion of its real character.

After his early popularity had waned, he was charged with treason to the republic and was imprisoned in the Abbaye on Aug. 20, 1792. A week later he was released at the intercession of Mme. Houret de la Marinière, who had been his mistress. He took refuge in Holland and England. His memoirs are *Mes six époques*. He returned to Paris in 1796, where he died May 18, 1799.

Gudin de la Brenellerie's *Histoire de Beaumarchais* (1809) was edited by M. Maurice Tourneux in 1888. See also L. de Loménie, *Beaumarchais et son temps* (1855). Eng. trans. by H. S. Edwards (1856); M. de Lescure, *Éloge de Beaumarchais* (1886); A. Hallay, *Beaumarchais* (1897); and Sainte-Beuve, *Causeries du lundi*, vol. vi. Beaumarchais's works have been edited by Gudin (1809); by Furne (1827); and by E. Fournier (1876). A variorum edition of his *Théâtre complet* was published by MM. d'Heylli and de Marescot (1860-75); and a *Bibliographie des œuvres de Beaumarchais*, by H. Cordier in 1883. A volume of his letters was published by Louis Thomas in 1923.

BEAUMARIS, market town, municipal borough, and county town, Anglesey, north Wales, situated at the north-east end of the Menai Strait. Population (1921) 1,841. The town is a typical small castle town. Beaumaris castle was built by Edward I. in 1203, the name being derived from the marsh ("beau marais") which was drained by the fosse. Communication with the sea by means of a canal enabled ships to discharge provisions for the garrison. The church of St. Mary is of the same period as the castle. The earliest charter was granted by Edward I. in 1283 and revised by Elizabeth. As in most towns of similar history, we find the establishment of a free grammar school in Elizabethan times (Beaumaris 1603). The town championed the Conservative cause during the Civil War and the Jacobean revolts. As county town it became a centre for social life, and for maritime and local trade, during the 18th and 19th centuries. Since the decline of the coastal trade Beaumaris has lived on its past, although it caters to a few visitors during the summer months.

BEAUMONT, CHRISTOPHE DE (1703-1781), French ecclesiastic, became bishop of Bayonne in 1741, archbishop of Vienne in 1743, and in 1746, at the age of 43, archbishop of Paris. To force the Jansenists to accept the bull *Unigenitus*, he ordered the priests of his diocese to refuse absolution to those who would not recognize the bull, and to deny funeral rites to those who had confessed to a Jansenist priest. While other bishops sent Beaumont their adhesion to his crusade, the *parlement* of Paris threatened to confiscate his temporalities. The king forbade the *parlement* to interfere in these spiritual questions, and upon its proving obdurate it was exiled (Sept. 18, 1753). The "royal chamber," which was substituted, having failed to carry on the administration of justice properly, the king was obliged to recall the *parlement*, and the archbishop was sent into honourable exile (Aug. 1754). An effort was made to induce him to resign the active duties of his see to a coadjutor, but in spite of the most tempting offers—including a cardinal's hat—he refused. On the contrary, to his polemic against the Jansenists he added an attack on the *philosophes*, and issued a formal mandatory letter condemning Rousseau's *Émile*. Rousseau replied in his masterly *Lettre à M. de Beaumont* (1762), in which he insists that freedom of discussion in religious matters is essentially more religious than the attempt to impose belief by force.

De Beaumont's *Mandements, lettres et instructions pastorales* were published in 1780, the year before his death.

BEAUMONT, BELMONT or BELLOMONT, the name of a Norman and English family, taken from Beaumont-le-Roger in Normandy. In the 11th century Roger de Beaumont, a kinsman of the dukes of Normandy, married a daughter of Waleran, count of Meulan, and their son, ROBERT DE BEAUMONT (died 1118), became count of Meulan or Mellent about 1080. Before this date, however, he had fought at Hastings, and had added large estates in Warwickshire to the Norman fiefs of Beaumont and Pont Audemer, which he received when his father entered the abbey of St. Peter at Préaux. It was during the reigns of William II. and Henry I. that the count rose to eminence, and under the latter monarch he became "the first among the counsellors of the king." A "strenuous and sagacious man," he rendered valuable service to both kings in their Norman wars, and Henry I. was largely indebted to him for the English crown. Henry of Huntingdon describes him as "the wisest man between this and Jerusalem." He seems to have been a man of independent character, for he assisted Anselm against William Rufus, although he supported Henry I. in his quarrel with Pope Paschal II. When Robert died in 1118 his lands appear to have been divided between his twin sons, Robert and Waleran, while a third son, Hugh, became earl of Bedford in 1138.

ROBERT DE BEAUMONT (1104-1168), justiciar of England, received his father's English fiefs in 1118, and became earl of Leicester. He and his brother, Waleran, were the chief advisers of Stephen, and helped this king to seize the bishops of Salisbury and Lincoln in 1130; later, however, Robert made his peace with Henry II., and became chief justiciar of England. First among the lay nobles he signed the Constitutions of Clarendon, he sought to reconcile Henry and Archbishop Becket, and was twice in charge of the kingdom during the king's absences in France. The earl founded the abbey of St. Mary de Pré at Leicester and other religious houses, and by a charter confirmed the burgesses of Leicester in the possession of their merchant-gild and customs. His son, Robert, succeeded to the earldom of Leicester, and with other English barons assisted prince Henry in his revolt against his father, the king, in 1173. For this participation, and also on a later occasion, he was imprisoned; but he enjoyed the favour of Richard I., and died in Greece when returning from a pilgrimage in 1190.

WALERAN DE BEAUMONT (1104-1166) obtained his father's French fiefs and the title of count of Meulan in 1118. After being imprisoned for five years by Henry I. he spent some time in England, and during the civil war between Stephen and the Empress Matilda he fought for the former until about 1150, when he deserted the king and assisted the empress.

Another member of the Beaumont family, possibly a relative of the earlier Beaumonts, was LOUIS DE BEAUMONT (d. 1333), bishop of Durham from 1317 until his death.

The barony of Beaumont dates from 1300, when HENRY BEAUMONT (died 1340), who was constable of England in 1322, was summoned to parliament under this title.

BEAUMONT, SIR JOHN (1583-1627), English poet, second son of the judge, Sir Francis Beaumont, was born at Grace-Dieu in Leicestershire in 1583. The death of his father (in 1598) and of his elder brother, Sir Henry Beaumont (in 1605), made the poet early the head of this brilliant family, the dramatist, Francis Beaumont, being a younger brother. John went to Oxford in Feb. 1597, and entered as a gentleman commoner in Broadgates hall, the present Pembroke college. He was admitted to the Inner Temple in 1600, but on the death of Henry he no doubt went down to Grace-Dieu to manage the family estates. He began to write verse early, and in 1602, at the age of 19, he published anonymously his *Metamorphosis of Tabacco*, written in very smooth couplets, in which he addressed Drayton as his "loving friend." He lived in Leicestershire for many years as a bachelor, being one "who never felt Love's dreadful arrow." But in process of time he became a tardy victim, and married a lady of the Fortescue family, who bore him four stout sons, the eldest of whom, another John, was accounted one of the most athletic men of his time. "He could leap 16ft. at one leap, and would commonly, at a stand-leap, jump over a high long table in the hall,

light on a settle beyond the table, and raise himself straight up." This magnificent young man was not without literary taste; he edited his father's posthumous poems, and wrote an enthusiastic elegy on him; he was killed in 1644 at the siege of Gloucester. Another of Sir John Beaumont's sons, Gervaise, died in childhood, and the incidents of his death are recorded in one of his father's most touching poems. Sir John Beaumont concentrated his powers on a poem in eight books, entitled *The Crown of Thorns*, which was greatly admired in ms. by the earl of Southampton and others, but which is lost. After long retirement, Beaumont was persuaded by the duke of Buckingham to move in larger circles; he attended court and in 1626 was made a baronet. This honour he did not long survive, for he died on April 19, 1627, and was buried in Westminster Abbey ten days later. The new Sir John, the strong man, published in 1629 a volume entitled *Bosworth Field; with a taste of the variety of other Poems left by Sir John Beaumont*. No more "tastes" were ever vouchsafed, so that it is by this volume and by the juvenile *Metamorphosis of Tabacco* that Beaumont's reputation has to stand. Of late years, the peculiarities of John Beaumont's prosody have drawn attention to his work. He wrote the heroic couplet, which was his favourite measure, with almost unprecedented evenness. *Bosworth Field*, the scene of the battle of which Beaumont's principal poem gives a vaguely epical narrative, lay close to the poet's house of Grace-Dieu. He writes on all occasions with a smoothness which was very remarkable in the first quarter of the 17th century, and which marks him, with Edmund Waller and George Sandys, as one of the pioneers of the classic reformation of English verse.

The poems of Sir John Beaumont were included in A. Chalmers's *English Poets*, vol. vi. (1810). An edition, with "memorial introduction" and notes, was included (1869) in Dr. A. B. Grosart's *Fuller Worthies' Library*; and the *Metamorphosis of Tabacco* was included in J. P. Collier's *Illustrations of Early English Popular Literature* vol. i. (1863). (E. G.)

BEAUMONT, WILLIAM (1785-1853), American physiologist, was born on Nov. 21, 1785, the son of a farmer. He studied privately under a practitioner, and after being granted a licence to practise by the Third Medical Society of the State of Vermont, became a surgeon in the United States army. His *Experiments and Observations* (1833) indicate Beaumont's importance in settling the chemical nature of digestion, the significance of the gastric juice, and the causes of the interruptions in its secretion.

BEAUMONT and FLETCHER, English dramatists. The names of FRANCIS BEAUMONT (1584-1616) and JOHN FLETCHER (1579-1625) are inseparably connected in the history of the English drama. John Fletcher was born in Dec. 1579 at Rye in Sussex, and baptized on the 20th of the same month. Richard Fletcher, his father, afterwards queen's chaplain, dean of Peterborough, and bishop successively of Bristol, Worcester, and London, was then minister of the parish in which the son was born who was to make their name immortal. That son was just turned of seven when the dean distinguished and disgraced himself as the spiritual tormentor of the last moments on earth of Mary Stuart. When not quite 12 he was admitted pensioner of Bene't college, Cambridge, and two years later was made one of the Bible-clerks: of this college Bishop Fletcher had been president 20 years earlier, and six months before his son's admission had received from its authorities a first letter of thanks for various benefactions, to be followed next year by a second. Four years later than this, when John Fletcher wanted five or six months of his 17th year, the bishop died suddenly of overmuch tobacco and the displeasure of Queen Elizabeth at his second marriage—this time, it appears, with a lady of such character as figures something too frequently on the stage of his illustrious son. He

¹Recent research has resulted in some variation of opinion as to the precise authorship of some of the plays commonly attributed to them; but this article, contributed to an earlier edition of the *Encyclopædia Britannica*, remains the classical modern criticism of Beaumont and Fletcher, and its value is substantially unaffected. As representing to the end the views of its distinguished author, it is therefore retained as written though with some omissions necessitated by the restricted space available, the results of later research being epitomized in the Bibliographical Appendix at the end. (Ed.)

left eight children by his first marriage in such distress that their uncle, Dr. Giles Fletcher, author of a treatise on the Russian commonwealth which is still held in some repute, was obliged to draw up a petition to the queen on their behalf, which was supported by the intercession of Essex, but with what result is uncertain.

From this date we know nothing of the fortunes of John Fletcher, till the needy orphan boy of 17 reappears as the brilliant and triumphant poet whose name is linked for all time with the yet more glorious name of Francis Beaumont, third and youngest son of Sir Francis Beaumont of Grace-Dieu, one of the justices of the common pleas—born, according to general report, in 1586, but, according to more than one apparently irrefragable document, actually born two years earlier. The first record of his existence is the entry of his name, together with those of his elder brothers Henry and John, as a gentleman-commoner of Broadgates hall, Oxford, now supplanted by Pembroke college. But most lovers of his fame will care rather to remember the admirable lines of Wordsworth on the "eager child" who played among the rocks and woodlands of Grace-Dieu; though it may be doubted whether even the boy's first verses were of the peaceful and pastoral character attributed to them by the great laureate of the lakes. That passionate and fiery genius which was so soon and for so short a time to "shake the buskined stage" with heroic and tragic notes of passion and of sorrow, of scorn and rage, and slighted love and jealousy, must surely have sought vent from the first in fancies of a more ardent and ambitious kind; and it would be a likelier conjecture that when Frank Beaumont (as we know on more authorities than one that he was always called by his contemporaries, even in the full flush of his adult fame—"never more than Frank," says Heywood) went to college at the ripe age of 12, he had already committed a tragedy or two in emulation of *Tamburlaine*, *Andronicus* or *Jeronymo*. The date of his admission was Feb. 4, 1597; on April 22 of the following year his father died; and on Nov. 3, 1600, having left Oxford without taking his degree, the boy of 15 was entered a member of the Inner Temple, his two brothers standing sponsors on the grave occasion. But the son of Judge Beaumont was no fitter for success at the bar than the son of Bishop Fletcher for distinction in the church: it is equally difficult to imagine either poet invested with either gown. Two years later appeared the poem of *Salmacis and Hermaphroditus*, generally attributed to Beaumont, a voluptuous and voluminous expansion of the Ovidian legend, not on the whole discreditable to a lad of 18, fresh from the popular love-poems of Marlowe and Shakespeare, which it naturally exceeds in long-winded and fantastic diffusion of episodes and conceits. At 23 Beaumont prefixed to the magnificent masterpiece of Ben Jonson some noticeable verses in honour of his "dear friend" the author; and in the same year (1607) appeared the anonymous comedy of *The Woman-Hater*, usually assigned to Fletcher alone; but being as it is in the main a crude and puerile imitation of Jonson's manner, and certainly more like a man's work at 22 than at 28, internal evidence would seem to justify, or at least to excuse those critics who in the teeth of high authority and tradition would transfer from Fletcher to Beaumont the principal responsibility for this first play that can be traced to the hand of either. As Fletcher also prefixed to the first edition of *Volpone* a copy of commendatory verses, we may presume that their common admiration for a common friend was among the earliest and strongest influences which drew together the two great poets whose names were thenceforward to be for ever indivisible. Entering college at the same age as Fletcher had entered six years earlier, Beaumont had before him a brighter and briefer line of life than his elder. But whatever may have been their respective situations when, either by happy chance or, as Dyce suggests, by the good offices of Jonson, they were first brought together, their intimacy soon became so much closer than that of ordinary brothers that the household which they shared as bachelors was conducted on such thoroughly communistic principles as might have satisfied the most trenchant theorist who ever proclaimed, as the cardinal point of his doctrine, a complete

and absolute community of bed and board, with all goods thereto appertaining. But in the year following that in which the two younger poets had united in homage to Jonson, they had entered into a partnership of more importance than this in "the same clothes and cloak, etc." with other necessities of life specified by Aubrey.

In 1608, if we may trust the reckoning which seems trustworthy, the twin stars of our stage rose visibly together for the first time. The loveliest, though not the loftiest, of tragic plays that we owe to the comrades or the successors of Shakespeare, *Philaster*, has generally been regarded as the first-born issue of their common genius. The noble tragedy of *Thierry and Theodoret* has sometimes been dated earlier and assigned to Fletcher alone; but we can be sure neither of the early date nor the single authorship. The main body of the play, comprising both the great scenes which throw out into full and final relief the character of either heroine for perfect good or evil, bears throughout the unmistakable image and superscription of Fletcher; yet there are parts which for gravity and steady strength of style, for reserve and temperance of effect, would seem to suggest the collaboration of a calmer and more patient hand; and these more equable and less passionate parts of the poem recall rather the touch of Massinger than of Beaumont. In the second act, for example, the regular structure of the verse, the even scheme of the action, the exaggerated braggardism which makes of the hero a mere puppet or mouthpiece of his own self-will, are all qualities which, for better or for worse, remind us of the strength or the weakness of a poet with whom we know that Fletcher, before or after his alliance with Beaumont, did now and then work in common. Even the Arbaces of Beaumont, though somewhat too highly coloured, does not "write himself down an ass," like Thierry on his first entrance, after the too frequent fashion of Massinger's braggarts and tyrants; does not proclaim at starting or display with mere wantonness of exposure his more unlovely qualities in the naked nature of their deformity. Compare also the second with the first scene of the fourth act. In style and metre this second scene is as good an example of Massinger as the first is of Fletcher at his best. Observe especially in the elaborate narrative of the pretended self-immolation of Ordella these distinctive notes of the peculiar style of Massinger; the excess of parenthetical sentences, no less than five in a space of 20 lines; the classical commonplace of allusion to Athens, Rome and Sparta in one superfluous breath; the pure and vigorous but somewhat level and prosaic order of language, with the use of certain cheap and easy phrases familiar to Massinger as catchwords; the flat and feeble terminations by means of which the final syllable of one verse runs on into the next without more pause or rhythm than in a passage of prose; the general dignity and gravity of sustained and measured expression. These are the very points in which the style of Massinger differs from that of Fletcher; whose lightest and loosest verses do not overlap each other without sensible distinction between the end of one line and the beginning of the next; who is often too fluent and facile to be choice or forcible in his diction, but seldom if ever prosaic or conventional in phrase or allusion, and by no means habitually given to weave thoughts within thoughts, knit sentence into sentence, and hang whole paragraphs together by the help of loops and brackets. From these indications we might infer that this poem belongs altogether to a period later than the death of Beaumont; though even during his friend's life it appears that Fletcher was once at least allied with Massinger and two lesser dramatists in the composition of a play, probably the *Honest Man's Fortune*, of which the accounts are to be found in Henslowe's papers.

Hardly eight years of toil and triumph, of joyous and glorious life were spared by destiny to the younger poet between the date assigned to the first radiant revelation of his genius in *Philaster* and the date which marks the end of all his labours. On March 6, 1616, Francis Beaumont died (according to Jonson and tradition) "ere he was 30 years of age," but this we have seen to be inconsistent with the registry of his entrance at Oxford. If we may trust the elegiac evidence of friends, he died of his own

genius and fiery overwork of brain; yet from the magnificent and masculine beauty of his portrait one should certainly never have guessed that any strain of spirit or stress of invention could have worn out so long before its time so fair and royal a temple for so bright and affluent a soul. A student of physiognomy will not fail to mark the points of likeness and of difference between the faces of the two friends; both models of noble manhood, handsome and significant in feature and expression alike—Beaumont's the statelier and serener of the two, with clear thoughtful eyes, full arched brows, and strong aquiline nose, with a little cleft at the tip; a grave and beautiful mouth, with full and finely curved lips; the form of face a long pure oval, and the imperial head with its "fair large front" and clustering hair set firm and carried high with an aspect at once of quiet command and kingly observation: Fletcher's a more keen and fervid face, sharper in outline every way, with an air of bright ardour and glad fiery impatience; sanguine and nervous, suiting the complexion and colour of hair; the expression of the eager eyes and lips almost recalling that of a noble hound in act to break the leash it strains at—two heads as lordly of feature and as expressive of aspect as any gallery of great men can show. That spring of 1616, we may note in passing, was the darkest that ever dawned upon England or the world; for, just 48 days afterwards, it witnessed, on April 23, the removal from earth of the mightiest genius that ever dwelt among men. Scarcely more than a month and a half divided the death-days of Beaumont and of Shakespeare. Some three years earlier by Dyce's estimate, when about the age of 29, Beaumont had married Ursula, daughter and co-heiress to Henry Isley of Sundridge in Kent, by whom he left two daughters, one of them posthumous. Fletcher survived his friend just nine years and five months; he died "in the great plague, 1625," and was buried on Aug. 20, in St. Saviour's, Southwark; not, as we might have wished, beside his younger fellow in fame, who but three days after his untimely death had added another deathless memory to the graves of our great men in Westminster Abbey, which he had sung in such noble verse. Dying when just four months short of 46, Fletcher had thus, as well as we can now calculate, altogether some 14 years and six months more of life than the poet who divides with him the imperial inheritance of their common glory.

The perfect union in genius and in friendship which has made one name of the two names of these great twin brothers in song is a thing so admirable and so delightful to remember, that it would seem ungracious and unkindly to claim for either a precedence which we may be sure he would have been eager to disclaim. But if a distinction must be made between the Dioscuri of English poetry, we must admit that Beaumont was the twin of heavenlier birth. Only as Pollux was on one side a demigod of diviner blood than Castor can it be said that on any side Beaumont was a poet of higher and purer genius than Fletcher; but so much must be allowed by all who have eyes and ears to discern in the fabric of their common work a distinction without a difference.

Although the beloved friend of Jonson, and in the field of comedy his loving and studious disciple, yet in that tragic field where his freshest bays were gathered Beaumont was the worthiest and the closest follower of Shakespeare. In the external but essential matter of expression by rhythm and metre he approves himself always a student of Shakespeare's second manner, of the style in which the graver or tragic part of his historical or romantic plays is mostly written; doubtless, the most perfect model that can be studied by any poet who, like Beaumont, is great enough to be in no danger of sinking to the rank of a mere copyist, but while studious of the perfection set before him is yet conscious of his own personal and proper quality of genius, and enters the presence of the master not as a servant but as a son. The general style of his tragic or romantic verse is as simple and severe in its purity of note and regularity of outline as that of Fletcher's is by comparison lax, effusive, exuberant. The matchless fluency and rapidity with which the elder brother pours forth the stream of his smooth swift verse gave probably the first occasion for that foolish rumour which has not yet fallen duly

silent, but still murmurs here and there its suggestion that the main office of Beaumont was to correct and contain within bounds the overflowing invention of his colleague. The poet who while yet a youth had earned by his unaided mastery of hand such a crown as was bestowed by the noble love and the loving "envy" of Ben Jonson was, according to this tradition, a mere precocious pedagogue, fit only to revise and restrain the too liberal effusions of his elder in genius as in years. Now, in every one of the plays common to both, the real difficulty for a critic is not to trace the hand of Beaumont, but to detect the touch of Fletcher. Throughout the better part of every such play, and above all of their two masterpieces, *Philaster* and *The Maid's Tragedy*, it should be clear to the most sluggish or cursory of readers that he has not to do with the author of *Valentinian* and *The Double Marriage*. In those admirable tragedies the style is looser, more fluid, more feminine. From the first scene to the last we are swept as it were along the race of a running river, always at full flow of light and buoyant melody, with no dark reaches or perilous eddies, no stagnant pools or sterile sandbanks; its bright course only varied by sudden rapids or a stronger ripple here and there, but in rough places or smooth still stirred and sparkling with summer wind and sun. But in those tragic poems of which the dominant note is the note of Beaumont's genius and a subtler chord of thought is sounded, a deeper key of emotion is touched than ever was struck by Fletcher. The lighter genius is palpably subordinate to the stronger, and loyally submits itself to the impression of a loftier spirit. It is true that this distinction is never grave enough to produce a discord: it is also true that the plays in which the predominance of Beaumont's mind and style is generally perceptible make up altogether but a small section of the work that bears their names conjointly; but it is no less true that within this section the most precious part of that work is comprised. Outside it we shall find no figures so firmly drawn, no such clearness of outline, no such cunning of hands as we recognize in the three great studies of Bellario, Evadne and Aspatia. In his male characters, as for instance in the parts of Philaster and Arbaces, Beaumont also is apt to show something of that exaggeration or inconsistency for which his colleague is perhaps more frequently and more heavily to blame; but in these there is not a jarring note, not a touch misplaced; unless, indeed a rigid criticism may condemn as unfeminine and incongruous with the gentle beauty of her pathetic patience the device by which Aspatia procures herself the death desired at the hand of Amintor. This is noted as a fault by Dyce; but may well be forgiven for the sake of the magnificent scene which follows, and the highest tragic effect ever attained on the stage of either poet. That this as well as the greater part of those other scenes which are the glory of the poem is due to Beaumont might readily be shown at length by the process of comparison. The noble scene of regicide, which it was found expedient to cancel during the earlier years of the Restoration, may indeed be the work of Fletcher; but the part of Evadne must undoubtedly be in the main assigned to the more potent hand of his fellow. There is a fine harmony of character between her naked audacity in the second act and her fierce repentance in the fourth, which is not unworthy a disciple of the tragic school of Shakespeare; Fletcher is less observant of the due balance, less heedful of the nice proportions of good and evil in a faulty and fiery nature, compounded of perverse instinct and passionate reaction. From him we might have had a figure as admirable for vigour of handling, but hardly in such perfect keeping as this of Beaumont's Evadne, the murderess—Magdalen, whose penitence is of one crimson colour with her sin. Nor even in Fletcher's *Ordella*, worthy as the part is throughout even of the precious and exquisite praise of Lamb, is there any such cunning touch of tenderness or delicate perfume of pathos as in the parts of Bellario and Aspatia. These have in them a bitter sweetness, a subtle pungency of mortal sorrow and tears of divine delight, beyond the reach of Fletcher. His highest studies of female character have dignity, energy, devotion of the heroic type; but they never touch us to the quick, never waken in us any finer and more profound sense than that of applause and

admiration. There is a modest pathos now and then in his pictures of feminine submission and slighted or outraged love; but this submission he is apt to make too servile, this love too dog-like in its abject devotion to retain that tender reverence which so many generations of readers have paid to the sweet memories of Aspatia and Bellario. To excite compassion was enough for Fletcher, as in the masculine parts of his work it was enough for him to excite wonder, to sustain curiosity, to goad and stimulate by any vivid and violent means the interest of readers or spectators. The single instance of noble pathos, the one scene he has left us which appeals to the higher and purer kind of pity, is the death of the child Hengo in *Bonduca*—a scene which of itself would have sufficed to enrol his name for ever on the list of our great tragic poets. But no surer test or better example can be taken of the distinctive quality which denotes the graver genius of either poet than that supplied by a comparison of Beaumont's *Triumph of Love* with Fletcher's *Triumph of Death*. Each little play, in the brief course of its single act, gives proof of the peculiar touch and special trick of its author's hand; the deeper and more delicate passion of Beaumont, the rapid and ardent activity of Fletcher, have nowhere found a more noticeable vent for the expression respectively of the most tender and profound simplicity of quiet sweetness, the most buoyant and impatient energy of tragic emotion.

In the wider field of their comic or romantic drama it is yet easier to distinguish the respective work of either hand. The bias of Fletcher was towards mixed comedy; his lightest and wildest humour is usually crossed or tempered by an infusion of romance; like Shakespeare in this one point at least, he has left no single play without some touch on it of serious interest, of poetic eloquence or fancy, however slight and fugitive. Beaumont, evidently under the imperious influence of Ben Jonson's more rigid theories, seems rather to have bent his genius with the whole force of a resolute will into the form or mould prescribed for comedy by the elder and greater comic poet. The admirable study of the worthy citizen and his wife, who introduce to the stage and escort with their applause *The Knight of the Burning Pestle* through his adventurous career to its untimely end, has all the force and fullness of Jonson's humour at its best, with more of freshness and freedom. In pure comedy, varied with broad farce and mock-heroic parody, Beaumont was the earliest as well as the ablest disciple of the master whose mantle was afterwards to be shared among the academic poets of a younger generation, the Randolphs and Cartwrights who sought shelter under the shadow of its voluminous folds. The best example of the school of Jonson to be found outside the ample range of his own work is *The Scornful Lady*, a comedy whose exceptional success and prolonged popularity must have been due rather to the broad effect of its forcible situations, its wealth and variety of ludicrous incidents, and the strong gross humour of its dialogue, than to any finer quality of style, invention or character. It is the only work of Beaumont and Fletcher which a critic who weighs the meaning of his words can admit to be as coarse as the coarsest work of Ben Jonson.

The buoyant and facile grace of Fletcher's style carries him lightly across quagmires in which a heavier-footed poet, or one of slower tread, would have stuck fast, and come forth bemired to the knees. To Beaumont his stars had given as birthright the gifts of tragic pathos and passion, of tender power and broad strong humour; to Fletcher had been allotted a more fiery and fruitful force of invention, a more aerial ease and swiftness of action, a more various readiness and fullness of bright exuberant speech. The genius of Beaumont was deeper, sweeter, nobler than his elder's; the genius of Fletcher more brilliant, more supple, more prodigal, and more voluble than his friend's. Without a taint or a shadow on his fame of such imitative servility as marks and degrades the mere henchman or satellite of a stronger poet, Beaumont may fairly be said to hold of Shakespeare in his tragedy, in his comedy of Jonson; in each case rather as a kinsman than as a client, as an ally than as a follower; but the more special province of Fletcher was a land of his own discovering, where no later colonist has ever had power to settle

or to share his reign. With the mixed or romantic comedy of Shakespeare it has nothing in common except the admixture or alternation of graver with lighter interest, of serious with humorous action. Nothing is here of his magic exaltation or charm of fairy empire. The rare and rash adventures of Fletcher on that forbidden track are too sure to end in pitiful and shameful failure. His crown of praise is to have created a wholly new and wholly delightful form of mixed comedy or dramatic romance, dealing merely with the humours and sentiments of men, their passions and their chances; to have woven of all these a web of emotion and event with such gay dexterity, to have blended his colours and combined his effects with such exquisite facility and swift light sureness of touch, that we may return once and again from those heights and depths of poetry to which access was forbidden him, ready as ever to enjoy as of old the fresh incomparable charm, the force and ease and grace of life, which fill and animate the radiant world of his romantic invention. Neither before him nor after do we find, in this his special field of fancy and of work, more than shadows or echoes of his coming or departing genius. The quality of his genius, never sombre or subtle or profound, bears him always towards fresh air and sunshine. His natural work is in a midday world of fearless boyish laughter and hardly bitter tears. There is always more of rainbow than of storm in his skies; their darkest shadow is but a tragic twilight. What with him is the noon of night would seem as sunshine on the stage of Ford or Webster. There is but one passage in all these noble plays which lifts us beyond a sense of the stage, which raises our admiration out of speech into silence, tempers and transfigures our emotion with a touch of awe. And this we owe to the genius of Beaumont, exalted for an instant to the very tone and manner of Shakespeare's tragedy, when Amintor stands between the dead and the dying woman whom he has unwittingly slain with hand and tongue. The first few lines that drop from his stricken lips are probably the only verses of Beaumont or Fletcher which might pass for Shakespeare's even with a good judge of style—

This earth of mine doth tremble, etc

But in Fletcher's tragedy, however we may be thrilled and kindled with high contagious excitement, we are never awed into dumb delight or dread, never pierced with any sense of terror or pity too deep or even deep enough for tears. Even his Brunhals and Martias can hardly persuade us to forget for the moment that "they do but jest, poison in jest." A critic bitten with the love of classification might divide those plays of Fletcher usually ranked together as comedies into three kinds: the first he would class under the head of pure comedy, the next of heroic or romantic drama, the third of mixed comedy and romance; in this, the last and most delightful division of the poet's work the special qualities of the two former kinds being equally blended and delicately harmonized. The most perfect and triumphant examples of this class are *The Spanish Curate*, *Monsieur Thomas*, *The Custom of the Country*, and *The Elder Brother*. Next to these and not too far below them, we may put *The Little French Lawyer* (a play which in its broad conception of a single eccentric humour suggests the collaboration of Beaumont and the influence of Jonson, but in style and execution throughout is perfect Fletcher), *The Humorous Lieutenant* (on which an almost identical verdict might be passed), *Women Pleased*, *Beggars' Bush*, and perhaps we might add *The Fair Maid of the Inn*; in most if not in all of which the balance of exultant and living humour with serious poetic interest of a noble and various kind is held with even hand and the skill of a natural master. In pure comedy *Rule a Wife and have a Wife* is the acknowledged and consummate masterpiece of Fletcher. Next to it we might class, for comic spirit and force of character, *Wit without Money*, *The Wild Goose- Chase*, *The Chances*, and *The Noble Gentleman*—a broad poetic farce to whose overflowing fun and masterdom of extravagance no critic has ever done justice but Leigh Hunt, who has ventured, not without reason, to match its joyous and preposterous audacities of superlative and sovereign foolery with the more sharp-edged satire and practical merriment of *King and No King*, where the keen

prosaic humour of Bessus and his swordsmen is as typical of the comic style in which Beaumont had been trained up under Ben Jonson as the high interest and graduated action of the serious part of the play are characteristic of his more earnest genius. Among the purely romantic plays of Fletcher, or those in which the comic effect is throughout subordinate to the romantic, *The Knight of Malta* seems most worthy of the highest place for the noble beauty and exaltation of spirit which informs it with a lofty life, for its chivalrous union of heroic passion and catholic devotion. This poem is the fairest and the first example of those sweet fantastic paintings in rose-colour and azure of visionary chivalry and ideal holiness, by dint of which the romance of more recent days has sought to cast the glamour of a mirage over the darkest and deadliest "ages of faith." The pure and fervent eloquence of the style is in perfect keeping with the high romantic interest of character and story. In the same class we may rank among the best samples of Fletcher's workmanship *The Pilgrim*, *The Loyal Subject*, *A Wife for a Month*, *Love's Pilgrimage*, and *The Lover's Progress*—rich all of them in exquisite writing, in varied incident, in brilliant effects and graceful and passionate interludes. In *The Coxcomb*, and *The Honest Man's Fortune* (two plays which, on the whole, can hardly be counted among the best of their class) there are tones of homelier emotion, touches of a simpler and more pathetic interest than usual; and here, as in the two admirable first scenes between Leucippus and Bacha, which relieve and redeem from contempt the tragic burlesque of *Cupid's Revenge*, the note of Beaumont's manner is at once discernible.

Even the most rapid revision of the work done by these great twin poets must impress every capable student with a sense of the homage due to this living witness of their large and liberal genius. There is the glory and grace of youth in all they have left us; if there be also somewhat too much of its graceless as well as its gracious qualities, yet there hangs about their memory as it were a music of the morning, a breath and savour of bright early manhood, a joyous and vigorous air of free life and fruitful labour, which might charm asleep forever all thought or blame of all mortal infirmity or folly, or any stain of earth that may have soiled in passing the feet of creatures half human and half divine while yet they dwelt among men. For good or for evil, they are above all things poets of youth; we cannot conceive of them grown grey in the dignity of years, venerable with the authority of long life, and weighted with the wisdom of experience. In the Olympian circle of the gods and giants of our race who on earth were their contemporaries and corrivals, they seem to move among the graver presences and figures of sedate fame like the two spoilt boys of heaven, lightest of foot and heart and head of all the brood of deity. In perfect workmanship of lyrical jewellery, in perfect bloom and slower of song-writing, they equal all compeers whom they do not excel; the blossoms of their growth in this kind may be matched for colour and fragrance against Shakespeare's, and for morning freshness and natural purity of form exceed the finest grafts of Jonson. *The Faithful Shepherdess* alone might speak for Fletcher on this score, being as it is simply a lyric poem in semi-dramatic shape, to be judged only as such, and as such almost faultless; but in no wise to be classed for praise or blame among the acting plays of its author, whose one serious error in the matter was the submission of his Dryad to the critical verdict of an audience too probably in great part composed of clowns and satyrs far unlike the loving and sweet-tongued sylvan of his lovely fancy. And whether we assign to him or to Beaumont the divine song of melancholy (*moestius lacrymis Simonideis*), perfect in form as Catullus and profound in sentiment as Shelley, which Milton himself could but echo and expand, could not heighten or deepen its exquisite intensity of thought and word alike, there will remain witness enough for the younger brother of a lyric power as pure and rare as his elder's.

The excess of influence and popularity over that of other poets usually ascribed to the work of Beaumont and Fletcher for some half century or so after their own time has perhaps been somewhat overstated by tradition. Whatever may have been for a

season the fashion of the stage, it is certain that Shakespeare can show two editions for one against them in folio; four in all from 1623 to 1685, while they have but their two of 1647 and 1679. Nor does one see how it can accurately or even plausibly be said that they were in any exact sense the founders of a school either in comedy or in tragedy. After Shakespeare there was yet room for Beaumont and Fletcher; but after these and the other constellations had set, whose lights filled up the measure of that diviner zodiac through which he moved, there was but room in heaven for the pallid moonrise of Shirley; and before this last reflex from a sunken sun was itself eclipsed, the glory had passed away from English drama, to alight upon that summit of epic song, whence Milton held communion with darkness and the stars. (A. C. S.)

BIBLIOGRAPHICAL APPENDIX

The chief collected editions of the plays of Beaumont and Fletcher are: *Comedies and Tragedies written by Francis Beaumont and John Fletcher, Gentlemen*, printed by Humphrey Moseley in folio in 1647 as containing plays "never printed before"; *Fifty Comedies and Tragedies written, etc.* (fol. 1679), *Works* . . . (1843-46), edited by Alexander Dyce, which superseded earlier editions by L. Theobald, G. Colman and H. Weber, and presented a modernized text; a second two-volume edition by Dyce in 1852; *The Works of Francis Beaumont and John Fletcher* (1905-12) edited by Arnold Glover and A. R. Waller in the "Cambridge English Classics" from the text of the 2nd folio, and giving variant readings from all separate issues of the plays previous to that edition; and *Works* . . . (1904 ff), under the general editorship of A. H. Bullen, the text of which is founded on Dyce but with many variant readings, the separate plays being edited by various editors.

The foundation of all critical work on Beaumont and Fletcher is to be found in Dyce. Discrimination between the work of the two dramatists and their collaborators has been the object of a series of studies for the establishment of metrical and other tests. Fletcher's verse is recognizable by the frequency of an extra syllable, often an accented one, at the end of a line, the use of stopped lines, and the frequency of trisyllabic feet. He thus obtained an adaptable instrument enabling him to dispense with prose even in comic scenes. The pioneer work in these matters was done by F. G. Fleay in a paper read before the New Shakespeare Society in 1874 on "Metrical Tests as applied to Fletcher, Beaumont and Massinger." His theories were further developed in the article "Fletcher" in his *Biog. Chron. of the Eng. Drama*. Further investigations were published by R. Boyle in *Englische Studien* (vols v-x, Heilbronn, 1882-87), and in the *New Shakespeare Society Transactions* (1880-86), by Benno Leonhardt in *Anglia* (Halle, vols. xix. seq.), and by E. H. Oliphant, a critic who, in *The Plays of Beaumont and Fletcher* (1927), restores to Beaumont much which other critics had denied him. On the sources of the plays see E. Köppl in *Münchener Beiträge zur roman. u. eng. Phil.* (Erlangen and Leipzig, 1895). Consult further articles by A. H. Bullen and R. Boyle respectively on Fletcher and Massinger in the *Dict. of Nat. Biog.*; G. C. Macaulay, *Francis Beaumont, a Critical Study* (1883); C. N. Gayley, *Francis Beaumont, Dramatist* (1914) and A. W. Ward's chapter on "Beaumont and Fletcher" in vol. ii. of his *Hist. of Eng. Dram. Lit.* (new ed 1899); and for the history and bibliography of individual plays E. K. Chambers, *The Elizabethan Stage*, vols. iii. and iv (1923). Also A. C. Potter, *A Bibliography of Beaumont and Fletcher* (*Harvard Bibliographical Contributions*, 1895).

A list of the plays attributed to Beaumont and Fletcher, with some details, is added, with the premise that, beyond the main lines of criticism laid down in Mr. Swinburne's article above, it is often difficult to dogmatize on authorship. Even in cases where the play was produced long after Beaumont had ceased to write for the stage there can be no certainty that we are not dealing with a piece which is an adaptation by a later hand of an earlier play.

The Joint Works of Beaumont and Fletcher—The Scornful Lady (acted between 1613 and 1616, pr. 1616) is a farcical comedy of domestic life, in which one scene may be by Massinger. *Philaster*, or

Love Lies a-Bleeding, is assigned by Macaulay to Beaumont practically in its entirety, while Fleay attributes only three scenes to Fletcher. It was probably acted c. between 1608 and 1610, and was printed 1620; it was revised (1695) by Elkanah Settle and (1763) by the younger Colman, probably owing its long popularity to the touching character of Bellario. Beaumont's share also predominated in *The Mud's Tragedy* (acted c. 1611, pr. 1619), in *A King and No King* (acted at court Dec. 26, 1611, and perhaps earlier, pr. 1619), while *The Knight of the Burning Pestle* (assigned by Chambers to 1607, pr. 1613), burlesquing the heroic and romantic play of which Heywood's *Four Prentices* is an example, might perhaps be transferred entire to Beaumont's account. In *Cupid's Revenge* (acted at court Jan. 1612, and perhaps at Whitefriars in 1610, pr. 1615), founded on Sidney's *Arcadia*, the two dramatists may have had other collaborators. The *Coxcomb* (acted c. 1610, and by the Children of the Queen's Revels in 1612, pr. 1647) seems to have undergone later revision by Massinger or Rowley.

Works Assigned to Beaumont's Sole Authorship.—*The Woman Hater* (pr. 1607, as "lately acted by the children of Paul's") was assigned formerly to Fletcher. *The Masque of the Inner Temple and Gray's Inn* was presented at Whitehall on Feb. 20, 1613, on the marriage of the Prince and Princess Palatine. Of *Four Plays, or Moral Representations, in One* (printed in 1647), the *Induction*, with *The Triumph of Honour and The Triumph of Love*, are by Beaumont.

Works Assigned to Fletcher's Sole Authorship.—*The Faithful Shepherdess* (pr. c. 1609) was ill received on its original production, but was revived in 1634. It was translated into Latin verse by Sir R. Fanshawe in 1658, and Milton's *Comus* owes not a little to it. In *Four Plays in One*, the two last, *The Triumph of Death* and *The Triumph of Time*, are Fletcher's. In the indifferent comedy of *The Captain* (acted 1612-13, revived 1626, pr. 1647) there is no definite evidence of any other hand than Fletcher's, though the collaboration of Beaumont, Massinger, and Rowley has been advanced. Other Fletcher plays are: *Wit without Money* (acted c. 1614, pr. 1639); the two romantic tragedies of *Bonduca* and *Valentinian*, both dating from c. 1614 and printed in the first folio; *Women Pleased* (c. 1620, pr. 1647); *The Woman's Prize, or the Tamer Tam'd* (assigned by Chambers to 1604, acted 1633 at Blackfriars and at court, pr. 1647), a kind of sequel to *The Taming of the Shrew*; *The Chances* (pr. 1647), taken from *La Sennora Cornelia* of Cervantes, and repeatedly revived after the Restoration and in the 18th century; *Monsieur Thomas* (acted perhaps as early as 1610, pr. 1630); *The Island Princess* (c. 1621, pr. 1647); *The Pilgrim* and *The Wild Goose Chase* (pr. 1652), the second of which was adapted in prose by Farquhar, both acted at court in 1621, and possibly then not new pieces; *A Wife for a Month* (lic. 1624, pr. 1647); *Rule a Wife and Have a Wife* (lic. 1624, pr. 1640). *The Pilgrim* (acted at court, 1621), received additions from Dryden and was adapted by Vanbrugh.

Fletcher in Collaboration with other Dramatists.—External evidence of Fletcher's connection with Massinger is given by Sir Aston Cokaine, who in an epitaph on Fletcher and Massinger wrote: "Playes they did write together, were great friends," and elsewhere claimed for Massinger a share in the plays printed in the 1647 folio. James Shirley and William Rowley have their part in works that used to be included in the Beaumont and Fletcher canon; and to a letter from Field, Daborne and Massinger, asking for £5 for their joint necessities from Henslowe about the end of 1615, there is a postscript suggesting the deduction of the sum from the "mony remaynes for the play of Mr. Fletcher and ours." The problem is complicated when the existing versions of the play are posterior to Fletcher's lifetime, that is, revisions by Massinger or another of pieces which were even originally of double authorship. In this way Beaumont's work may be concealed under successive revisions, and it would be rash to assert that none of the late plays contains anything of his.

Fletcher and Massinger.—R. Boyle joins the name of Cyril Tourneur to those of Fletcher and Massinger in connection with *The Honest Man's Fortune* (acted 1613, pr. 1647), which Fleay identifies with "the play of Mr. Fletcher and ours." *The Knight of Malta* (acted 1618-19, pr. 1647) is regarded by Oliphant as the work of Fletcher, Massinger and Field; *Thierry and Theodoret* (acted c. 1617, pr. 1621), perhaps a satire on contemporary manners at the French court as a revision by Massinger of an earlier work by Beaumont and Fletcher, though Beaumont's share in either must be regarded as problematical. Fletcher and Massinger's great tragedy of *Sir John van Olden Barnavelt* (acted 1619) was first printed in Bullen's *Old Plays* (vol. II., 1883). They followed it up with *The Custom of the Country* (acted c. 1619, pr. 1647), based on an English translation (1619) of *Los Trabajos de Persiles y Sigismunda*; *The Double Marriage* (c. 1620, pr. 1647); *The Little French Lawyer* (c. 1620, pr. 1647); *The False One* (c. 1620, pr. 1647); *The Spanish Curate* (acted 1622, pr. 1647), repeatedly revived after the Restoration, was derived from Leonard Digges's translation (1622) of a Spanish novel, *Gerardo, the Unfortunate Spaniard*; *The Prophetess* (1622, pr. 1647), afterwards made into an opera by Betterton to Purcell's music; *The Elder Brother* (perhaps originally written by Fletcher c. 1614; revised and acted 1635, pr. 1637); *Beggars' Bush* (acted at court 1622, probably then not new, pr. 1647).

Other Combinations.—Fletcher had only a small share in *The Noble*

Gentleman (1625-26, pr. 1647), and in *Wit at Several Weapons*—"if he but writ an act or two," says an epilogue on its revival (1623 or 1626). The play is probably a revision by Rowley and Middleton of an early Beaumont and Fletcher play. *A Very Woman* (1634, pr. 1655) is a revision by Massinger, perhaps of *The Woman's Plot*, ascribed to Fletcher and acted at court in 1621. Field worked with Fletcher and Massinger on the lost play of *The Jeweller of Amsterdam* (1619), and perhaps on *The Queen of Corinth* (c. 1616, pr. 1647). *The Lover's Progress* (acted 1634, pr. 1647), is probably a revision by Massinger of the Fletcher play licensed in 1623 as *The Wandering Lovers*. *Love's Cure or The Martial Maid* (1623 or 1624) is thought by Fleay to be a revision by Massinger of a Beaumont and Fletcher play produced as early as 1607-08. W. Rowley joined Fletcher in *The Maid in the Mill* (1623, pr. 1647). *The Nice Valour* (acted 1625-26, pr. 1647) seems to have been altered by Middleton from an earlier play. *The Night Walker* (1633) is a revision by Shirley of a Fletcher play.

Fletcher and Jonson in Collaboration.—The history of *The Bloody Brother or Rollo, Duke of Normandy*, printed in 1639 as by "B. J. F.," is matter of varied speculation. Mr. Oliphant thinks the basis of the play to be an early work (c. 1604) of Beaumont, on which is superimposed a first revision (1616) by Fletcher and Jonson, and a subsequent revision (1636-37) by Massinger. The general view is that the main portion of the play is referable to Jonson and Fletcher. Jonson apparently had a share in Fletcher's *Love's Pilgrimage* (pr. 1647), which seems to have been revised by Massinger in 1635.

Fletcher and Shakespeare.—*The Two Noble Kinsmen* was printed in 1634 as by Mr. John Fletcher and Mr. William Shakespeare. If its first representation was in 1625 it was in the year of Fletcher's death. It was included in the second folio of Beaumont and Fletcher's comedies and tragedies. If Shakespeare and Fletcher worked in concert it was probably in 1612-13, and the existing play probably represents a revision by Massinger in 1625. *Henry VIII.* (played at the Globe in 1613) is usually ascribed mainly to Shakespeare and Fletcher, with a probable revision by Massinger and the conditions of its production were probably similar. Fletcher and Shakespeare are together credited at Stationers' Hall with the lost play of *Cardenio*, destroyed by Warburton's cook.

BEAUMONT, a city of Texas, U.S.A., at the head of navigation on the Neches river, 28m. from the Gulf of Mexico and 70m. N.E. of Galveston; the county-seat of Jefferson county. It is on the Old Spanish Trail, is served by the Kansas City Southern, the Missouri Pacific, the Santa Fe, and the Southern Pacific railways, and by coastwise and deep-sea steamers. The population was 9,427 in 1900; 20,640 in 1910; 40,422 in 1920; and was estimated at 54,400 in 1926. Nearly a third are negroes.

Beaumont is the commercial centre of south-eastern Texas and south-western Louisiana, a region of dense pine and cypress forests, extensive rice plantations, and some of the most important oil-fields of the country. Oil refineries, rice-mills, saw and shingle mills, and sash and door factories constitute the leading industries. The output of the 73 establishments within the city in 1925 was valued at \$11,864,088. In the same year 607 ocean-going steamers entered the port, and its total traffic, consisting chiefly of crude oil and its products, amounted to 5,239,766 tons, valued at \$153,202,590. The assessed valuation of property in 1926 was \$51,366,280, and bank debits in 1926 amounted to \$258,931,000. The city has a commission-manager form of government.

Beaumont was settled in 1828, and was chartered as a city in 1881. Oil was struck in 1901, and in the next 25 years its population increased more than fivefold.

BEAUNE, a town of France, capital of an arrondissement in the department of Côte-d'Or, on the Bouzoise, 23m. S.S.W. of Dijon on the main line of the P.L.M. railway. Pop. (1926) 10,949. Beaune lies in a rich wine-growing region at the foot of the hills of Côte-d'Or. It was a fortified Roman camp and the capital of a separate county united to the duchy of Burgundy, becoming in 1227 the first seat of the Burgundian parlement or *jours généraux* and a ducal residence. On the death of Charles the Bold it sided with his daughter, Mary of Burgundy, but was besieged and taken by the forces of Louis XI. in 1478. Its rank as commune, conceded in 1203, was confirmed in 1521. In the religious wars it at first sided with the League, but opened its gates to the troops of Henry IV., who confirmed its communal privileges. The revocation of the Edict of Nantes dealt a severe blow to the cloth and iron industries, which had previously been a source of prosperity to the town, and it was only through its vineyards that the town regained its importance. In the 18th century there were no fewer than seven monastic buildings in Beaune, besides a Ber-

nardine abbey, a Carthusian convent and an ecclesiastical college. The town is of circular form, and its ancient fortifications have been in part replaced by a promenade separating it from its suburbs. The most interesting feature is the old hospital of St. Esprit (1443). Some buildings surrounding the main courtyard, which has an out-door pulpit and a well with 15th century iron-work, have high-pitched roofs surmounted by dormer windows with decorated gables, recalling the Flemish style. The hospital possesses mural paintings (17th century) in the Salle St. Hugues and an altar-piece, the Last Judgment, attributed to Van Eyck. The principal church, Notre Dame (mainly 12th and 13th centuries), has a fine central tower and a triple portal with handsome wooden doors. The interior contains circular chapels, old glass, and some 15th century tapestries. Two round towers (15th century) are a survival of the castle of Beaune, dismantled by Henry IV. A belfry of 1403 and several houses of the Renaissance period, some built over ancient wine-cellars, are notable. Beaune has tribunals of first instance and of commerce, a chamber of commerce, and a school of agriculture and viticulture. Live stock, cereals, vegetables, oil and vinegar are marketed, and casks, agricultural implements and jewellery manufactured. It is the centre of the wine trade of Burgundy (q.v.).

BEAUREGARD, PIERRE GUSTAVE TOUTANT (1818-1893), American soldier, was born near New Orleans, La., on May 28, 1818. At the U.S. military academy he graduated second in his class in 1838, and was appointed lieutenant of engineers. In the Mexican War he distinguished himself in siege operations at Vera Cruz, and took part in all the battles around Mexico, being wounded at Chapultepec. In 1853 he became captain and was in charge of fortification and other engineer works of various points, on the Gulf coast from 1853 to 1860. He had just been appointed superintendent of West Point when the secession of his state brought about his resignation (Feb. 20, 1861). As a brigadier-general of the new Confederate army he directed the bombardment of Fort Sumter, S.C. As the commander of the Southern Army of the Potomac he opposed McDowell's advance to Bull Run, and during the battle was second in command under Joseph E. Johnston. He was one of the five full generals appointed in Aug. 1861, and in 1862 was second in command under Sidney Johnston on the Tennessee. After Johnston's death he directed the battle of Shiloh, subsequent to which he retired to Corinth. This place he defended against the united armies under Halleck, until the end of May 1862, when he retreated in good order to the southward. His health now failing, he was employed in less active work. He defended Charleston against the Union forces from Sept. 1862 to April 1864. In May 1864 he fought a severe and eventually successful battle at Drury's Bluff against Gen. Butler and the Army of the James. Later in the year he endeavoured to gather troops wherewith to oppose Sherman's advance from Atlanta, and eventually surrendered with Johnston's forces in April 1865. After the war he engaged in railway management, became adjutant-general of his state and managed the Louisiana lottery. He died in New Orleans on Feb. 20, 1893. He was the author of *Principles and Maxims of the Art of War* (Charleston, 1863); *Report on the Defence of Charleston* (Richmond, 1864).

See Alfred Roman, *Military Operations of General Beauregard* (1883); Y. R. Le Monnier, "General Beauregard at Shiloh," in *Neale's Monthly*, iii. 147-165 (1914); Gamaliel Bradford, *Confederate Portraits* (1914).

BEAUTY: see AESTHETICS, also TERTIARY QUALITIES under QUALITIES: PRIMARY, SECONDARY AND TERTIARY.

BEAUTY CULTURE is the science of improving personal appearance. It embraces the care of the skin, the hair, the hands and nails, the teeth and the body, to make them conform to the standard regarded by the current generation as beautiful.

Since earliest times, cosmetics have played a part in the social life of civilization. To-day, specialists in beauty culture employ diet, exercise, hygiene, electricity, X-ray, radium, gland stimulation and gland extracts, water cures, sun-treatments, plastic surgery, massage, osteopathy and mental science to create health and beauty.

However, hygiene, sunshine, mental science, etc., constitute only a background for the specialized work of the beauty culturist. Largely, and in actual practice, beauty culture is "the application of cosmetic preparations to the human body by massaging, stroking, kneading, slapping, tapping, stimulating, manipulating, exercising, cleansing, or by means of devices, apparatus or appliances, and arranging, dressing, marcelling, curling, waving, cleansing, singeing, bleaching, colouring, dyeing, tinting or otherwise treating by any means the hair of any person." This inclusive definition is quoted from the Illinois law which requires that anyone who practises beauty culture have a certificate of registration.

The report of the census of manufactures of the department of commerce shows the value of perfumery, cosmetics and toilet preparations manufactured in the United States in 1914 to have been something over \$25,000,000. In 1925, the year of the most recent published report, the figures are over \$147,000,000.

(D. C.)

BEAUVAIS, a town of north France, capital of the department of Oise, 49m. N. by W. of Paris, on the Northern railway. Pop. (1926) 16,966. Beauvais lies at the foot of hills on the left bank of the Thérain at its confluence with the Avelon, and at the focus of a large number of roads. Known to the Romans as Caesaromagus, its present name is due to the Gallic Bellovaci, whose capital it was. In the 9th century it became a countship, which about 1013 passed to the bishops, who became peers of France. The English besieged it in 1346 and 1433. The siege of 1472 is famous for its association with Jeanne Hachette. The ancient ramparts are now occupied by boulevards. The cathedral of St. Pierre, in some respects the most daring achievement of Gothic architecture, consists only of a transept and choir with apse and seven apse-chapels. The vaulting in the interior exceeds 150ft in height. The small Romanesque church of the 10th century known as the Basse Oeuvre occupies the site destined for the nave. Begun in 1247, the work was interrupted by various collapses. The transept was built from 1500 to 1548. Its façades exhibit the rich late Gothic style. The north and south portals and especially their wooden doors are masterpieces respectively of Gothic and Renaissance workmanship, but its artistic treasures are stained glass windows of the 13th, 14th and 16th centuries. The old town centres around the hôtel-de-ville (1752) and the cathedral, and has several mediaeval houses. The episcopal palace (16th century) is now a courthouse. The State manufacture of tapestry at Beauvais dates from 1664; cotton and woollen goods and toys are the main products. Market-gardening and trade in grain and wine are carried on. The town is the seat of a bishop, a prefect and a court of assizes, it has tribunals of first instance and of commerce.

BEAUVILLIER, the name of a very ancient French family belonging to the country around Chartres, members of which are found filling court offices from the 15th century onward. For Charles de Beauvillier, gentleman of the chamber to the king, governor and *bailli* of Blois, the estate of Saint Aignan was created a countship in 1537. François de Beauvillier, comte de Saint Aignan, after having been through the campaigns in Germany (1634-35), Franche-Comté (1636), and Flanders (1637), was sent to the Bastille for having lost the battle of Thionville in 1640. In reward for his devotion to the court party during the Fronde, Saint Aignan was raised to a duchy in the peerage of France (*duché-pairie*) in 1663. His son Paul, called the duc de Beauvillier, was several times ambassador to England; he became chief of the council of finance in 1685, governor of the dukes of Burgundy, Anjou and Berri from 1689 to 1693, minister of state in 1691, and grandee of Spain in 1701. He married a daughter of Colbert. Paul Hippolyte de Beauvillier, comte de Montrésor, afterwards duc de Saint Aignan, was ambassador at Madrid from 1715 to 1718 and at Rome in 1731, and a member of the council of regency in 1719.

BEAUVOIR, ROGER DE, the *nom de plume* of EUGÈNE AUGUSTE ROGER DE BULLY (1809-1866), French writer, was born in Paris. The son and nephew of public officials who did not approve his literary inclinations, he wrote over the signature of Roger de Beauvoir. He astonished all Paris with his ostentatious

luxury and his adventures, while his romantic novels gave him a more serious, if not durable, reputation. Among the best of them are *L'Ecolier de Clumy ou le Sophisme* (1832), which is said to have furnished Alexandre Dumas and Theodore Gaillardet (1808-1882) with the idea of the *Tour de Nesle*, and *Le Chevalier de Saint Georges* (1840). He had married in 1847 an actress, Eléonore Léocadie Doze (1822-1859), from whom he obtained a judicial separation a year or two later, after a long and notorious trial, following which his mother-in-law got him imprisoned for three months and fined 500 francs for a satirical poem, *Mon Procès* (1849). Ruined by extravagance, and tied to his chair by gout, he died in Paris on Aug. 27, 1866.

BEAUX, CECILIA (1863-), American portrait-painter, was born in Philadelphia (Pa.), where she became a pupil of William Sartain. But her real art training was obtained in Paris, where she started in the atelier Julian and had the coaching of painters like Robert-Fleury, Bouguereau and Dagnan Bouveret. In 1890 she exhibited at the Paris Exposition. Returning to Philadelphia, Miss Beaux obtained in 1893 the gold medal of the Philadelphia Art Club, and the Dodge prize at the New York National Academy, the Saltus gold medal of the National Academy of Design in 1913, and later various other distinctions. She became a member of the National Academy of Design, New York, in 1902, and is a director of the American Federation of Arts, and a member of Société des Beaux Arts. Among her portraits are those of Bishop Coadjutor Greer (exhibited at the Salon in 1896); Mrs. Roosevelt and her daughter; and Mrs. Larz Anderson. Her "Dorothea and Francesca," and "Ernesta and her Little Brother," are good examples of her skill in painting children.

BEAVER, the largest European aquatic rodent (*see* RODENTIA), recognized by its large, flat, scaly tail. The true beaver (*Castor fiber*) inhabits Europe and N Asia, but is represented in N. America by the allied *C. canadensis*, distinguished by the form of the nasal bones of the skull. The beavers form the family *Castoridae*, in which the hind feet are webbed and the claw of the second hind toe is double. The present day species are both about 3 ft. long, of which nearly one-third is tail. The valuable fur is composed of two kinds of hair—one close-set, silky and grey; the other coarser, longer and reddish-brown. Formerly common in England, the European beaver is now confined to the Elbe, the Rhone and to parts of Scandinavia. The American species has also greatly decreased in numbers. Beavers are gregarious, living in streams, where, to render the water of sufficient depth to prevent its freezing to the bottom, they build dams of mud, stones and tree trunks. These structures are frequently of great strength and show considerable ingenuity. In the pools made by the dams the American beavers build "lodges," chambers opening under water and formed of the same materials as the dam. Both dam and lodge are built in the autumn, and the lodge is covered on the outside with mud, which freezes as hard as stone and is an efficient protection against wolves and other carnivores.

The favourite food of the American beaver is the root of the water-lily but it will also eat bark, leaves and berries. When the ice breaks in spring, the beavers leave their lodges and lead a roving life until the autumn. The flesh of the beaver resembles pork in flavour.

Fossil remains of beavers occur in peat in Europe generally, while in the Pleistocene of England and Siberia are found the bones of a giant extinct form, *Trogontherium cuvieri*.

Beaver.—The lower part of the helmet (*q.v.*) fixed to the neck-armor to protect the face and cheeks; properly it moved upwards, as the visor moved down, but the word is sometimes used to include the visor. The right form of the word, "haver," has been altered from a confusion with "beaver," a hat made of beaver-fur or a silk imitation, also, in slang, called a "castor," from the zoological name of the beaver family.

BEAVERBROOK, WILLIAM MAXWELL AITKEN, 1ST BARON (1879-), was born at Newcastle (N.B.), May 25, 1879, the son of the Rev. William Aitken, a Presbyterian minister at Newcastle. At an early age he started business in Halifax (N.S.), but later removed to the wider field of Montreal, where in 1907 he acquired a seat on the stock exchange.

In 1910 he was asked by the Bank of Montreal to investigate the prospects of an amalgamation of three Canadian cement mills. As a consequence of his examination he slipped almost by accident into a scheme for the amalgamation of all the Canadian mills, and made at a stroke an immense fortune. He found himself the object of an organized Press attack, and achieved a considerable unpopularity throughout Canada, but time has proved the finance of the Cement Trust to be sound.

At this point Aitken, having attained his predetermined aim of making £1,000,000, retired from business and entered English politics. He won a seat in parliament at Ashton-under-Lyne in Dec. 1910, and became private secretary to Bonar Law. His influence with that statesman, who, in 1911, became Leader of the Opposition, was suspect to many Conservative members. He was raised to the peerage in Jan. 1917 as Baron Beaverbrook of Beaverbrook (N.B.) and Cherkley, Surrey. He had been knighted in 1911 and created a baronet in 1916.

At the outbreak of the World War he had become Canadian "Eye-Witness" at the front. In 1915 he became a representative of the Canadian Government with the Expeditionary Force, taking charge later of the Canadian war records. In Feb. 1918 he joined the cabinet as Chancellor of the Duchy of Lancaster and Minister of Information in charge of propaganda. Immediately after the Armistice he resigned from the cabinet and abandoned politics.

For some years before this date Lord Beaverbrook had possessed a financial interest in *The Daily Express*, but had taken no active part in its direction. He now took over entire control and gave the newspaper his whole attention. In 1921 he founded *The Sunday Express*, and after a prolonged struggle established it successfully as a popular Sunday journal. Later he secured a controlling interest in *The Evening Standard*—thus creating a kind of triple alliance. His published works are the first two volumes of *Canada in Flanders; Success*, a study of the ethics of business; *Politicians and the Press* (1925); and *Politicians and the War* (1928). Lord Beaverbrook married in 1906 Gladys Henderson (d. 1927), daughter of Brig.-Gen. C. W. Drury, of Halifax (N.S.).

BEAVER DAM, a city of Dodge county (Wis.), U.S.A., 55m. north-west of Milwaukee, on Beaver lake, and served by the Chicago, Milwaukee, St. Paul and Pacific railway. The population was 7,992 in 1920; about 10,000 in 1927. Dodge county is a rich farming district and the county fair held at Beaver Dam has a wide reputation. The manufactures of the city include stoves, shoes, hosiery, electric batteries, barn equipment and other articles, which have a wide market. Beaver Dam was settled about 1841 and incorporated in 1856.

BEAVER FALLS, a borough of Beaver county, Pennsylvania, U.S.A., on a plateau 50ft. above the Beaver river, three and one-half miles from its confluence with the Ohio, and about 30m. N.W. of Pittsburgh. It is served by the Pennsylvania and the New York Central railways. The population was 12,802 in 1920, of which 2,656 were foreign-born white, and was estimated at 13,147 in 1925.

This is one of the important manufacturing boroughs of the populous and busy Beaver valley. There are coal-mines, stone-quarries, and gas-wells in the vicinity, and within five miles of Beaver Falls there are about 200 factories with an annual output valued at \$45,000,000. Leading manufactures are steel wire, matting and nails; park amusement devices; scales and files; lumber, kegs and barrels; well-drillers, stoves, enamelled signs, chemicals, cork, glass, porcelain and white glazed tiles. Geneva college, established in 1849 at Northwood, O., by the Reformed-Presbyterian Church, was moved in 1880 to College Hill, the borough adjoining Beaver Falls on the north. Beaver Falls (originally called Brighton) was settled in 1801 and was incorporated in 1868.

BY COURTESY OF THE NEW YORK ZOOLOGICAL SOCIETY
THE AMERICAN BEAVER (*CASTOR CANADENSIS*), NUMEROUS IN RIVERS OF NORTHERN NORTH AMERICA

BEAVER MUSK: see CASTOREUM.

BEAWAR or **NAYANAGAR**, a town of British India, the administrative headquarters of the small Merwara district in Ajmere Merwara. It is 33m. from Ajmere. Pop. (1921), 22,362. It trades in raw cotton, and has cotton presses and the Krishna cotton mills.

BEBEL, AUGUST (1840-1913), for many years the most popular and influential leader of the German Social Democratic Party, was born at Deutz, a suburb of Cologne, on Feb. 22, 1840, the son of a non-commissioned officer in the Prussian army. He lost both his parents before he was 14, when he was apprenticed to a master turner in the town of Wetzlar. In 1858, after the completion of his apprenticeship, he began the customary *wanderjahre* of the German journeyman, visiting the towns of middle and south Germany, western Austria and northern Switzerland.

At that time no real labour movement existed in Germany. The movement based on the *Communist Manifesto*, issued by Marx and Engels on the eve of the revolution of 1848, had been suppressed when the strong reaction set in, and its remaining supporters were few and obscure. Thus it was that Bebel, though a Protestant, joined during his *wanderjahre* one of the network of Catholic journeymen's clubs in south Germany which were inspired by the social reformer, Father Kolping; but in 1860, disgusted by the bigoted spirit shown at the evangelical juvenile club at Erfurt, he left it, and did not join another.

Strangely enough, Bebel won his first oratorical success at a working man's study circle at Leipzig against Socialist members who wished to turn the society into a political one. For some years he was one of the most popular leaders of the non-Socialist labour movement. But he was gradually converted by the force of events to the Social Democratic *Allgemeine Deutsche Arbeiterverein* founded by Lassalle at Leipzig in May, 1863. His conversion was completed on the arrival in Leipzig of Wilhelm Liebknecht, who had been expelled from Prussia, and now became his friend. The two men complemented one another. Liebknecht was better educated than Bebel, but Bebel had the sharper eye and keener sense of practical politics.

The Austro-Prussian War of 1866, provoked by Bismarck, found Liebknecht and Bebel among its strongest opponents. When it was over and the North German Federation had been constituted under the hegemony of Prussia, the two friends founded, with others, the Saxon People's Party (*Sächsische Volkspartei*), with a programme proclaiming "inexorable war against the political conditions created in Germany by the war" and demanding the union of Germany in a democratic state. Unlike similar parties in south Germany the *Sächsische Volkspartei* decided to participate in the elections for the newly created *Reichstag*. Bebel was elected deputy for the 17th electoral division of Saxony, which included the industrial centres of Glauchau and Meerane, which he represented in the *Reichstag* until 1877, when he surrendered this safe seat to the party and won one of the divisions of Dresden. Almost all his speeches at that time were protests against the splitting up of Germany, accompanied by sharp criticism of resultant conditions, which provoked some stormy interruptions. While Liebknecht desired to confine the parliamentary action of the party to protest, Bebel energetically took part in debates on matters of economic interest for the working classes, demanding measures in their favour, voting for these in division, and so obtaining the abolition of some abuses.

In 1869, at a congress held at Eisenach, at which Bebel was the principal speaker, the union of the *Sächsische Volkspartei* and the other Socialist organizations which supported Liebknecht and Bebel, with the seceding members of the Lassallian organizations, was accomplished. A Social Democratic Party was formed on the basis of the Eisenach programme, which embodied the principles of the International Working Men's Association, whose general council was in London. The new party declared itself a member of the association as far as German law permitted. (See INTERNATIONAL.)

In the early summer of 1870, on the outbreak of the Franco-Prussian War, Bebel and Liebknecht declared, during a discussion in the *Reichstag* on the war loan, that they would "neither

vote the loan, because that would be a vote of confidence in a Government that by its procedure in 1866 had prepared the war, nor reject it, because such a rejection might be interpreted as approving Bonaparte's wanton and cruel policy," and that they would consequently abstain from voting. This action drew down on them violent abuse in the *Reichstag* and in the press. But in November, after the German victory of Sedan, the North German Government asked for another 100,000,000 thalers for the continuance of the war to compel the cession of Alsace and Lorraine; not only Bebel and Liebknecht, but the three Lassallian members who had voted for the original loan, refused to vote this money. Bebel and Liebknecht put forward a motion asking the *Reichstag*, since the newly formed French Republic had expressed a desire for peace, "to urge the chancellor to work for an early peace, renouncing any annexation of French territory." This motion, and the reasons given for it by Bebel, provoked an unprecedented outburst of rage. A number of deputies attacked him with clenched fists and coarse abuse, and in the press Bebel and Liebknecht were denounced as "enemies of their country."

Bebel was re-elected by his constituents to the new *Reichstag*, though all the other Social Democrat candidates were beaten. In the *Reichstag* he opposed Bismarck's war against the Roman Catholic Church, and predicted its failure; in a later speech he opposed the prolongation of the dictatorship in Alsace-Lorraine and criticized the help given to the bourgeois government of France in beating down the Paris Commune. He declared that the eyes of the European proletariat were fixed on Paris. The struggle there might only be an "outpost skirmish," but before many decades had passed "the war cry of the Paris proletariat—war on palaces, peace to the hovels, death to poverty and idleness—would be the battle cry of the European proletariat." Bismarck referred to this speech of Bebel's when in the autumn of 1878 he spoke in the *Reichstag* in defence of his Exceptional Law against Social Democracy. It had, he declared, clearly shown him the dangerous character of the Socialist agitation. There is reason to doubt the accuracy of this statement; at that time Bismarck was disturbed by the entirely legal parliamentary policy of the party (it had brought forward a bill demanding a maximum working day of ten hours), not by its revolutionary agitation. But whatever his reasons, Bismarck from that time repeatedly tried to promote measures hampering the activity of the Social Democrats. At first the Bismarckian press sounded the alarm against Bebel's declaration. Then the police and the public prosecutors took open action against the speakers of the "Bebel party," with the result that its membership increased, that Bebel's popularity was second to none with the workers, and that even non-Socialist circles recognized him as the most brilliant speaker in the *Reichstag*.

He was highly respected for his modest way of living on his earnings as a small master turner (he had set up for himself after victimization by an ill-disposed employer). In 1866 he had married a railwayman's daughter, who was an affectionate companion and indefatigable helper; she died in 1910. His daughter (b. 1869) had her father's eagerness for learning and her mother's unselfish modesty.

On March 11, 1872, Bebel and Liebknecht were tried at Leipzig on a charge of "treasonable intentions." An enormous mass of documents, printed and otherwise, was produced by the public prosecutor as evidence, but not the slightest proof of their participation in any act tending to high treason was discovered, though the defendants frankly admitted the revolutionary nature of their aims. During the fortnight's trial the daily press incited the jury against them. They were declared guilty, and were sentenced to two years' confinement in a fortress, a sentence declared, not only by Socialists, but by many radicals, to be a judicial scandal. But, for Bebel, the sentence proved a blessing in disguise. His health was so seriously affected by overwork that his friends feared for his life, since they knew that he could not be induced to take a reasonable holiday. The two men were interned in the castle of Hubertusburg in rooms arranged as cells, but they enjoyed the liberties usually granted to persons sentenced to detention in a fortress. They could walk every day in the garden, at their own request they received a piece of land to cultivate, and eventu-

ally Liebknecht was allowed to visit Bebel in his cell to give him lessons in English and French. Bebel also studied works on economics, history and science, making copious notes and almost all his writings on social politics were prepared or planned during his detention at Hubertusburg. Before he entered on this term of imprisonment Bebel had been condemned by the Leipzig District Council to nine months' imprisonment and exclusion from the *Reichstag* for a criticism on William I. of Prussia. But at the by-election necessitated by this sentence Bebel was re-elected, receiving twice as many votes as the coalition candidate; in 1874 he was re-elected to the new *Reichstag* by a similarly large majority. All over the country the prosecution of Social Democrats was pursued with increasing severity, and after a short period of freedom Bebel was again sentenced to nine months' imprisonment. He served these two terms in the fortress of Königstein and in the prison of Zwickau.

The fruit of this enforced leisure appeared in *Der Deutsche Bauernkrieg* (1876) and a translation of the treatise by Yves Guyot and Sigismond Lacroix on the "Social Teaching of Christianity," with a critical commentary on it and an appendix on the present and future position of women, which revolutionized the ideas of many members of the party on that question. Up to that time the final word on the woman question among the majority of German working-men had been "Man's place is the factory, woman's the home," and the adage seemed to be confirmed by the position in the engineering and similar trades. But Bebel, who had lived in a textile centre and had made exact investigations, perceived that it left out of account the social changes consequent on technical progress. He therefore expressed much sympathy with the movement for the political and social emancipation of women, regarded at that time by most Social Democrats as a mere caprice of middle-class women, and supported it, unmoved by the derision and even angry criticism of most Socialist colleagues. During a later term of imprisonment he elaborated his *Die Frau und der Sozialismus* (1893), which also contained a criticism of capitalist society, and a description of the forces impelling it to a social cataclysm which would make Socialism a necessity, concluding with a description of the Socialist transformation of society, its possibilities, and its realization by a policy of economic expediency, social justice and humanitarian ethics. This book was enormously popular with German working-men and their sympathizers; it ran into 52 editions, and was translated into many languages. Bebel's writings on the woman question contributed very substantially to popularize the demand for equal citizenship for women, and to make woman suffrage part of the political programme of German Social Democracy.

The persecution of the Socialists led to the union at Whitsuntide 1875 of the two rival Socialist parties and the foundation of a United Socialist Party whose programme was severely criticized by Karl Marx in a private circular letter to other members of the Eisenach party (Bebel being then in prison). But its programme met the practical requirements of the moment, and at the general election of 1877 the Socialist vote increased from 350,000 (1874) to 493,000. Bismarck realized the futility of the prosecutions, and promoted an Exceptional Law to make the existence of an organized Socialist Party impossible and to prohibit the publication of its literature. Against this bill Bebel delivered (Sept. 16, 1878) a speech in the *Reichstag*, in which he described Bismarck's early attempt to secure the co-operation of the Socialists in his struggle with the Liberals, and revealed the conferences between Bismarck and Lassalle in the winter of 1863-64. He asserted that the projected law would never accomplish its purpose; the ideals of the movement were too deeply implanted in the hearts of thousands of workers. If their meetings and societies were suppressed the workers, like the early Christians, would devote themselves with religious zeal to the propagation of its ideas, and it was absolutely impossible for the Government to suppress this widespread underground activity.

The law was nevertheless promulgated and rigorously executed, causing no little perplexity among Social Democratic leaders. But Bebel, with his strong practical sense, created with Liebknecht and Wilhelm Hasenclever, an office at Leipzig to assist the vic-

tims of the law; this office increased the confidence of the party in its three promoters, and provided a much needed political party centre; a party paper was published in Zurich by exiled members of the party. Some of the statements in this paper called forth severe criticism from Marx and Engels. Early in December 1880 Bebel, with one of the three Zurich managers of the paper, Eduard Bernstein, went to London and effected an understanding with these revered intellectual founders of the movement. In *My Years in Exile* Bernstein wrote: "Bebel, who at this time was in the full prime of his intellectual powers, delighted both the old men with his frankness and the exhaustive explanations which he gave them on the political situation in Germany and the state of the party." Three months earlier, the first congress of the German Social Democratic Party had been held at Schloss Wyden, in the canton of Zurich, and there, as at the two later congresses held abroad on account of the Bismarckian law, Bebel struck the keynote for the tactics of the party. There was, nevertheless, some confusion about the significance of the Marx-Engels theory of Socialism, to remedy which the *Neue Zeit* was founded by Kautsky with the strong support of Bebel and Bernstein.

After the inglorious end of the Exceptional Law in 1890 the party, at its Erfurt congress, adopted a new programme with a theoretical introduction by Karl Kautsky, and the *Neue Zeit* became an authoritative weekly party organ. Dissension, however, continued. In Berlin and other northern centres the belief among younger members of the movement that a social upheaval was now due led to the demand for a more radical policy, while in the south Georg von Vollmar, a Saxony deputy, advocated a moderate opportunist policy towards the Caprivi government. Bebel fought both sections; the youth movement soon subsided, but Vollmar's policy found many adherents in Munich and the south. The dispute turned largely on agrarian policy, and on this Bebel was defeated for the first time on a question of importance at a party congress (Breslau, 1895). He took his defeat calmly, and his influence in the party was little impaired. At Hamburg (1897) he carried a resolution opposed by Liebknecht, and at Hanover (1899) carried another against a book by Eduard Bernstein, *Evolutionary Socialism* (Eng. trans. 1909), written to oppose the view that a reformist policy was useless in view of the imminent collapse of capitalist society. Bebel made a speech of six hours against it, and his resolution, unanimously passed, reaffirmed the principle of the class-war and defined the historic task of the working-classes as the achievement of the greatest possible welfare for all by the socialization of the means of production and exchange.

In 1903 this dispute was renewed at the party congress at Dresden, where Bebel made a passionate speech leading to a resolution, almost unanimously carried, against the participation by Social Democrats in a bourgeois administration; but the resolution was so worded that most "revisionists" (or moderate party) were able to vote for it, as it condemned, they said, principles they had never advocated. Nevertheless the resolution had far-reaching international effects, for it was moved as binding on the international movement by the Guesdists (see GUESDE, JULES BASILE) at the international congress at Amsterdam in 1904. Jean Jaurès opposed it because it would render impossible the political tactics which he thought indispensable in France. There followed an unforgettable oratorical duel between Jaurès and Bebel, in which the latter came off victor.

One point made by Jaurès remained unanswered; he had declared that the German party, in spite of its magnificent organization, lacked the two essential means of proletarian action—the revolutionary and the parliamentary. Bebel did not forget the reproach. In subsequent years he carried out personally the struggle against militarism by land and sea, and against imperialism; in congresses and in the *Reichstag* he pointed out that under the modern policy of alliances a new war could hardly be restricted to any two States, but would assume European dimensions; he denounced as criminal folly the systematic violent incitement against England by considerable sections of the German nationalists. In a speech against the von Tirpitz policy (*Reichstag*, Jan. 22, 1903) he said: "Especially during recent years and also dur-

ing the Boer War I have emphatically maintained the opinion that I could not imagine a greater misfortune than a serious quarrel between England and Germany." During the Morocco crisis of 1911 (see GERMANY; History) Bebel opposed the action of the German Government more violently, and he and his colleagues backed a pamphlet by Bernstein which declared the increase of the German navy to be the "real English danger" to the German people. But before the outbreak of the World War, Bebel died of heart failure at Passug, Grisons, Switzerland, on Aug. 13, 1913, lamented by the whole Socialist movement. With his passionate sentiment and strong sense of what was practicable, he might well be called an ideal leader for the proletariat struggling for power.

His life shows him the sworn opponent of militarist tendencies and of the policy arising from them. In his parliamentary speeches this opposition and the desire for a union of the nations find powerful expression. A large number of speeches on these and other questions were issued at the time in pamphlet form; many characteristic passages are included in Franz Kluss, *August Bebel, der Mann und sein Werk* (1923). (E. BER.)

BEBUNG, in music, an effect principally associated with the clavicord, consisting of the prolongation or repetition of a note, not by striking it again, but by continuing to press the key slightly with the finger. The effect was much admired and was cited by C. P. E. Bach in a well known passage as a reason for preferring the clavicord to the pianoforte, on which it is not possible. Less commonly the term is also applied to the tremolo of a singer and to the throbbing or pulsating tone of a violinist. "Balancement" (Fr.) means the same thing.

BECCAFICO (Ital. "fig-pecker"), a name applied to a small bird, the garden warbler (*Sylvia hortensis*); also to several allied species (see WARBLER).

BECCAFUMI, DOMENICO DI PACE (1486-1551), Italian painter, of the school of Siena, was the son of a peasant, Giacomo di Pace, who worked on the estate of Lorenzo Beccafumi, who adopted the boy and sent him to study painting in the city. Known afterwards as Domenico Beccafumi, or earlier as Il Mecerino, he showed extraordinary industry and talent. He painted a vast number both of religious pieces for churches and of mythological decorations for private patrons. But the work by which he will be longest remembered is the pavement of the cathedral of Siena, on which he worked from 1517 to 1544, which had been begun 150 years before. He made very ingenious improvements in the technical processes employed, and laid down multitudinous scenes from the stories of Ahab and Elijah, of Melchisedec, of Abraham and of Moses. Beccafumi at one time or another essayed almost every branch of fine art. He made a triumphal arch and an immense mechanical horse for the procession of the emperor Charles V on his entry into Siena.

BECCARIA, GIOVANNI BATTISTA (1716-1781), Italian physicist, was born at Mondovì, and entered the religious order of the Pious Schools in 1732. He became professor of experimental physics, first at Palermo, then at Rome, and later at Turin, where he died. Beccaria, who was a fellow of the English Royal Society, did much, in the way both of experiment and exposition, to spread a knowledge of the electrical researches of Franklin and others. His principal work was the treatise *Dell'Elettricismo Naturale ed Artificiale* (1753; Eng. trans. 1776).

BECCARIA, CESARE BONESANA, MARCHESE DE (1738-1794), Italian publicist, was born at Milan and educated in the Jesuit college at Parma. He was a brilliant mathematician, but his principal work was done in economics. He held an official position under the Austrian government, and issued reports on corn supplies, the reform of the coinage, population and other questions. In 1768 he was appointed to a chair of law and economy founded expressly for him at the Palatine college of Milan. In 1771 he was made a councillor of state and a magistrate, and in 1790 he was appointed a member of a public commission for the reform of civil and criminal jurisprudence in Lombardy. His lectures on political economy, published after his death by Custodi, anticipated in a remarkable way the conclusions of Adam Smith. He insisted on the necessity of the division of labour and of the maxi-

mum return from labour, and deduced from this the nature and function of capital. He also expounded the laws of the relation between the growth of population and subsistence in anticipation of Malthus. In a report dated 1780, he proposed a metric system based on astronomical and nominal magnitudes and physical properties. About 1761 he and his friends the Verris formed in Milan a society for the study of social and political questions, and in 1764 they began to issue a periodical, *Il Caffè*, in imitation of the *Spectator*. In the same year Beccaria published the famous little treatise *Dei Delitti e delle Pene* (*On Crimes and Punishments*), which passed through six editions in 18 months, and was translated into 22 European languages. The French translation, by Morellet (1766), contained an anonymous preface by Voltaire. In the preface to this book first appeared the phrase "the greatest happiness of the greatest number." It advocated the prevention of crime rather than punishment, and promptness in punishment where punishment was inevitable; above all, it condemned confiscation, capital punishment, and torture. Beccaria's ideas directly influenced the reforming activities of Peter Leopold, Grand Duke of Tuscany (who abolished capital punishment), and of Catherine II, empress of Russia; in England, Bentham and Romilly advocated his ideas; and his theories were enthusiastically received in France, and were utilized in the revolutionary code.

BIBLIOGRAPHY.—P. Villari, *Le Opere di Cesare Beccaria* (Florence, 1854) contains, among other things, the *Dei Delitti*, the articles from *Il Caffè*, and the Milan lectures on political economy; there is an English translation of the *Dei Delitti* by J. A. Farrer (1880). *Beccaria's Scritti e lettere inedite* were published at Milan in 1910. See also C. Phillipson, *Three Criminal Law Reformers* (1923).

BECCLES, municipal borough, Suffolk, England; on the right bank of the river Waveney, 8m. W. of Lowestoft on the London and North-eastern railway. Population (1921) 7,085. Its site overlooks the Waveney. The church of St. Michael, wholly Perpendicular, is a fine example of the style, and has a detached bell tower. Rose Hall, in the vicinity, is a moated manor of brick, of the 16th century. Printing works, malting, boiler making and agricultural implement works are the chief industries. Beccles was incorporated in 1584. It is governed by a mayor, four aldermen and 12 councillors. Area 2,017 acres. It is included in the Lowestoft parliamentary division of east Suffolk.

BÊCHE-DE-MER or TREPANG (Malay, *tripang*), dried holothurians used in the gelatinous soups considered a luxury by the Chinese and other Eastern peoples. The name was not originally a French word, but is gallicized from Portuguese *Bicho da mar*, sea-worm. Holothurians are a class of Echinodermata (*q.v.*) popularly called "sea-cucumbers" from their shape. Those used for trepang mostly belong to the genus *Holothuria*, e.g., *H. edulis*. These live on coral reefs, from the Eastern Archipelago down to the Great Barrier Reef of Australia, also on the Californian coast, where there is a large trade in them. The body is from 6 to 15 in. long, and the skin may bear spicules or prickles of lime, fewer in the better kinds. On the Pacific coasts the finest is the "brown with teats," i.e., tube-feet; followed in order by the large black, the small black, the red-bellied, and the white. They are prepared for use by being boiled for about 20 minutes, and then dried first in the sun and afterwards over a fire.

BECHER, JOHANN JOACHIM (1635-1682), German chemist, physician, scholar, and adventurer, was born at Spire in 1635. After a hard childhood and youth, in which study was difficult because of the necessity of supporting his mother and brothers, Becher began an extraordinary career in which the publication of learned works alternated with the development of enterprises of colonization and trade. His first book, an edition of Salzthal's *Tractatus de lapide trismegisto*, appeared in 1654, when he was 19, and was followed by a score of considerable works. At Munich he was suggesting to the Elector of Bavaria the establishment of colonies in South America and a monopoly of the cloth trade, until he was driven to flight by the anger of the merchants; in 1666 he was in Vienna under the protection of Count Zinzendorf, and after an interval in Bavaria was again in Vienna proposing a Rhine-Danube canal and the opening up of trade with the Low Countries, and later employed in experiments for transmuting the Danube sand into gold. He fell into disgrace with

Zinzendorf, fled to Holland and then to England, where he died in 1682. His ideas and experiments on the nature of minerals and other substances are set forth in his *Physica Subterranea* (Frankfort, 1669); an edition of this, published at Leipzig in 1703, contains two supplements, *Experimentum chymicum novum* and *Demonstratio Philosophica*, arguing the truth and possibility of transmuting metals, *Experimentum novum ac curiosum de minera arenaria perpetua*, a paper on timepieces, and *Specimen Beche-rianum*, a summary of his doctrines by Stahl.

BECHUANA: see CHWANA.

BECHUANALAND, a country named after its inhabitants, the Bechuana. The name is applied to a region, which includes the Bechuanaland Protectorate and British Bechuanaland. The latter area, lying between the Orange and Molopo rivers, was included in Cape Colony in 1895 (q.v.). The protectorate, estimated at 275,000sq.m., is bounded on the west by south-west Africa, on the north by Portuguese West Africa and the Zambesi river, on the north-east by southern Rhodesia, on the south-east by the Transvaal, on the south by the Molopo and Nossob rivers. The country has not been completely surveyed, but its mean elevation is estimated at about 3,300 feet. The greater part is gently undulating, but in the east, near the Transvaal border, are several groups of bold hills. Most of the Bechuanaland hills are of the inselberg type. The lowest areas, probably not much above 2,000ft., occur in the north-east and south-west. Here and there are "pans," or hollows, which are apparently due to the action of wind and of the trampling and wallowing of game. Their floors are covered with tufaceous limestone, or sandy mud, unless the rock is exposed.

In the eastern part of the country ancient granites, gneisses and schists outcrop, and representatives of the Nama, Waterberg and Karroo systems must extend for some distance into the protectorate from the Transvaal and southern Rhodesia. Some of these have been proved about Palachwe. The greater part of the region, however, is covered by the Kalahari sands, which are generally stained red, but which may be white where the colouring material has been reduced along the watercourses. Alluvium and saliferous marls occur in the Okavango basin. There is very little surface water, except in the rainy season, and very little run-off, since rain sinks easily into the sands. In the dry season the only rivers which maintain their flow are the Zambesi, Chobe, Marico, Limpopo and the effluents from the Okavango marshes. Water can be obtained not far below the surface in the beds of the larger rivers. Boreholes, made by the Administration in the west of Bechuanaland, with a view to developing the ranching industry, have not proved very successful, and the water, when obtained, was sometimes very brackish. In the northern part of the country are large marshy depressions, such as that about the shallow Lake Ngami (q.v.) in the north-west. This is connected by the Botletle river with another wide depression, in which is the Makarikari salt pan.

Very little accurate information as to the climate is available. The summers are intensely hot. In the dry season the nights may be cool, while the days are still hot, though sudden falls of temperature are liable to occur. The rainfall is probably about 15 or 20in., with rather more in the north-east, and less in the south-west. Most of the rain falls between December and the end of April in heavy, but short, showers. The incidence and the quantity of the rainfall are very variable. Dust storms are frequent. Malaria is prevalent, especially in the low lying and damper parts.

True forest is rare, but a large proportion of the country is covered with thorn savannah, species of acacia predominating. In parts a dense thorny undergrowth, between the trees, makes traffic almost impossible. Indigo and cotton plants grow wild, and a species of wild water melon, tsoma, is very abundant. Though there is little surface water, plant roots can generally reach down to the layer of wet sand. Even the Kalahari "Desert" in the west is largely covered with bush; its dead, overgrown sand dunes point to more arid conditions in the past. On the other hand, in parts of the country there are remains of ancient trees, which, together with the size of the stream beds, appear to indicate a period of greater rainfall. It has been suggested that the destruction of the trees was due to caterpillars. A considerable amount of destruction in recent times has been done by domesticated animals, and

by the native practice of burning the grass toward the end of the dry season. For some distance to the north of Mafeking the country has been denuded of trees to supply Kimberley with fuel.

Toward the north the number of tropical species in the bush gradually increases, and the *Adansonia digitata* (baobab), *Hyphaene crinita*, *Balsamodendron africanum*, *Aloe rubrolutea*, etc., become common. On rocky sites succulents, such as *Aloe dichotoma*, and *Euphorbia Dinteri*, abound. The typical grasses of Bechuanaland are species of *Aristida*, *Eragrostis*, *Fingerhuthia*, *Panicum*, etc. There is much good grazing in the country.

The protectorate is fairly rich in wild animals, which include many species of antelope, as well as elephants, hippopotami, rhinoceroses, giraffes, buffaloes, lions, leopards, hyaenas and jackals. Among the birds are the ostrich and bustard. Poisonous snakes such as puff adders and cobras, are numerous; so are scorpions, tarantulas, spiders, flying beetles, locusts, "white ants" (termites) and mosquitoes. Crocodiles occur in some of the rivers. The principal fish are the catfish and yellow fish. In the temporary streams, fish burrow into the mud before it hardens for the dry season. During the years 1922 to 1925 a campaign was carried out against the locusts, and 37,000 swarms were destroyed.

Population, Land and Towns.—According to the 1921 census the population consists of 1,743 Europeans, 150,185 Bantu, 52 Asiatics and 1,003 other coloured. Many of the Bantu are settled on tribal reserves, which have been clearly delimited, and which are inalienable. In addition to these lands there are large extents of Crown land, with regard to which no policy has been declared. A comparatively small amount of land has been disposed of to white settlers, with the exception of a few farms in Ngamiland. Title to lands, known as the Tuli, Gaberones and Lobatsi blocks of farms, have been granted to the British South African company. The Lobatsi block has been cut up into farms, some of which are occupied. The Tati district, lying between the Rhodesian border and the Shashi river, was formerly part of Matabeleland. It has an extent of about 2,000sq. miles. The land and mineral rights belong to the Tati Co., Ltd. Portions of this district, within easy reach of the railway, have been marked off into farms of from 2,000 to 5,000 acres. These are available for settlement, and some have been taken up.

Two small towns are situated on the railway—Gaberones and Francistown, the latter being the centre of the gold mining area of the Tati district, and the most important white settlement in the protectorate. Some of the native villages are of considerable size. Among them are the following:—Serui (Serowe), chief place of the Bamangwato, pop., 25,000. Probably the largest native village in South Africa. It was founded by Khama in 1903 about 250m. N.E. of Mafeking and 35m. from Palapye Road, in country which is better watered than that about the former capital, Palachwe. Kanya (Kanye), chief place of Bangwaketse, pop., 12,000. 80m. from Mafeking and 30 from the nearest railway station, Lobatsi. Molepololi, chief place of Bakwena, pop., 9,000. Mochudi, chief place of Bakgatla, pop., 8,000. Maun, chief place of Batawana, pop., 5,000. Lehututu is the chief centre of western Bechuanaland. Well defined roads run from Molepololi and Kanya to Lehututu, some 300m. to the west. Water pits have been dug at intervals along the roads.

Occupations.—In spite of fairly fertile soil, agriculture gives uncertain and often scant returns, owing to the uncertainty and meagreness of the rains. No irrigation is practised. The British South Africa company has an experimental farm, 7m. from Lobatsi railway station. The chief native crops are millet and maize. Bechuanaland is essentially a pastoral area. The veld is of the "sweet" and "sour" varieties, the former making excellent pasture. Though rinderpest in 1896 swept off over 90% of the cattle, their numbers quickly recovered. The following table gives the number of live stock in the country in 1921:—

	Cattle	Sheep	Goats	Horses and mules	Donkeys
Owned by natives	426,344	120,186	237,740	2,264	6,206
Owned by Europeans	68,718	12,268	10,231	493	2,278

The small number of horses and mules in the territory is due to the prevalence of horse sickness. Great care is taken to prevent the introduction of contagious cattle diseases, especially east coast fever, which has hitherto been prevented from entering the country. No cattle, sheep, goats, pigs, horses, mules or donkeys, no skins or horns, no vehicles, except railway stock and motor cars, nor any wagon gear or harness may be imported without written permission. No cattle may be moved from one district of the protectorate to another without permission in writing. Cattle cannot be moved out of the Bamangwato reserve, where pleuropneumonia exists.

A good deal of trapping of wild animals is done; the skins are sold to railway passengers at the various halts along the line, and to white traders. The old hunting rights over tribal territory are reserved to the various chiefs, on the condition that they observe a close season. A small amount of gold mining is carried on in the Tati district. The output for the financial year 1921-22 was 4,643 ozs. of gold and 706 ozs. of silver. Copper has also been reported in this area, and coal has been proved near Palachwe.

Communications.—The eastern part of the country is traversed by a 403m. long section of the Cape Town to Rhodesia railway, which enters the protectorate at Ramathlabana, and runs through Palapye Road and the Tati district, and then on to Bulawayo. The extension of the railway toward the north was hastened by the Matabele and Mashona rebellion of 1896, and by the dislocation of the old ox wagon transport in the same year by rinderpest. Roads, feasible for motor transport, connect the principal native villages with the railway, but, beyond 50m. to the west of the railway only ox transport can be used. Wagon tracks leave Palapye Road for Ngami, 320m. to the north-west. The old trade route to Bulawayo, which skirted the edge of the Kalahari, is rarely used. Telegraph and telephone lines, linking southern Rhodesia with the Union of South Africa, follow the railway, and are owned and worked by the Rhodesian Government. A branch wire runs from Palapye Road to Serui (35 miles). There are 21 post offices and seven telegraph offices in the territory, the principal one being at Serui.

Trade.—No statistics of exports and imports are now kept. For customs purposes the area is treated as part of the Union of South Africa, which pays a sum of money quarterly to the protectorate. The latter collects its own customs duties on intoxicating liquors made in, and imported from, South Africa. No intoxicating drink may be imported without written permission, and the sale or gift of beer, spirits or wine to any native is strictly forbidden. A written permission is also required for the importation of arms and ammunition.

The chief imports consist of articles of clothing, blankets, ploughs, iron and tin ware and groceries. The principal exports include hides, skins and wool, cattle for both slaughter and breeding purposes in South Africa, timber for fuel and pit props, and, in years of good harvests, a certain amount of grain. The yearly export of cattle involves about 20,000 or 30,000 head. Goats and sheep are also exported. All export of live stock has to take place through one of the six points of exit—Ramathlabana, Ramaquabane, Sequane, Kwaganae, Kavimba, Kazungula. A payment of 2s.6d. a head is charged on all cattle sent out of the country. Cattle dealers entering the protectorate to buy cattle need a licence.

Government.—The form of government is very similar to that of Basutoland, and efforts are made to maintain the tribal system. The country is administered by a commissioner, nominated by the Crown, and responsible to the high commissioner for South Africa. The protectorate is divided into a northern and southern district, each having its assistant commissioner, at Francistown and Gaberones respectively. Each of these districts is again subdivided into two parts, each in charge of a magistrate, supported by a body of police. The headquarters of the administration and the seat of the commissioner are beyond the borders of the protectorate at Mafeking.

In 1920 councils of Europeans and natives were established to advise the commissioner on matters affecting Europeans and natives respectively. The commissioner, however, exercises all the powers of a supreme court. In 1912 the "Special Court of the

Bechuanaland Protectorate," consisting of a judge or advocate of the Supreme Court of South Africa, appointed by the high commissioner as president, and of two assistant commissioners, nominated by the commissioner, was established to try cases of (a) civil actions, in which either party is a European, and in which claims or property exceeding the value of £1,000 are in dispute; (b) criminal cases, in which the accused is a European charged with treason, murder, culpable homicide, rape, perjury, arson, offences against the coinage, etc. The native chiefs adjudicate on all matters arising among their own tribesmen, though the latter now have the right of appeal to the court of a magistrate, or assistant commissioner.

A hut tax of £1 for every hut, used as a dwelling place, is levied annually, and an additional tax of 3s. a hut is charged, and credited to a native fund for the purposes of education, and of general improvement in the reserves. In the tribal areas the tax is collected by the chiefs, who receive a commission not exceeding 10%. Elsewhere it is collected by officers appointed by the commissioner. Until the financial year 1914-15 any excess of expenditure over revenue was met by an imperial grant-in-aid. Since that date the revenue has usually exceeded expenditure, the chief item of which is the cost of the police force. There is no public debt. "The Bechuanaland Protectorate Police Force" consists of 9 European officers, 18 European non-commissioned officers and men, 50 Bantu non-commissioned officers and men, mostly from Basutoland, and 146 Bechuana, employed as dismounted constables.

Labour.—Within the protectorate there is only a limited demand by Europeans for native labour, and it is mainly in the comparatively small areas open to the white settler in the Tati and Ghanzi districts, and in the Tuli, Gaberones and Lobatsi blocks of farms. A considerable number of men leave for labour in the mines and elsewhere in the Union of South Africa. Native labour is recruited by labour agents, who must hold a licence, deposit or find security for £100, and fix a domicile in the territory, where any civil process may be served in respect of breach of contract.

Education, Religion, etc.—There are ten schools for white children, one for coloured, and 65 native schools. The latter are situated in the native villages, and in the reserves. About 5,600 native children attend these schools, and the number would probably be greater but for the custom of sending the boys away to distant cattle posts. The native schools are supported by the native fund, which also makes a contribution to Tiger Kloof, an institution in British Bechuanaland for the training of teachers. At the 1921 census 16,344 males and 20,175 females were returned as literate. Several Christian denominations are represented in the country. In the principal native villages there are well-built churches, which were paid for by the natives. For Europeans there are churches at Serui and Francistown.

No one may practise as a physician, surgeon or chemist without a licence. There is a small hospital at Gaberones, but all the more serious cases are taken to the Victoria hospital at Mafeking. Toward the cost of its erection the protectorate made a contribution. The principal medical officer resides at Mafeking, and there are medical officers at Gaberones, Serui and Francistown. Railway medical officers travel up and down the railway line.

See annual reports on the protectorate, published by the Colonial Office, London. Consult also the Official Year Books of the Union of South Africa. (R. U. S.)

HISTORY

Bechuanaland was visited by Europeans from Cape Colony in the last quarter of the 18th century. Travellers and explorers, such as M. H. K. Lichtenstein and W. J. Burchell, both distinguished naturalists, and the Rev John Campbell, one of the founders of the Bible Society, had made known the main features of the southern part of the country by 1821. About 1817 Mosilikatze, the founder of the Matabele nation, fleeing from the wrath of Chaka, the Zulu king, began a career of conquest during which he ravaged a great part of Bechuanaland before he finally settled in the north, in what is now Matabeleland. Meanwhile the London Missionary Society had founded in 1818 a station at Kuruman and thither came in 1821 the noted Scottish missionary, Robert Moffat (q.v.). For 50 years Moffat made Kuruman his

headquarters and largely through his efforts—he was preacher, teacher, carpenter, blacksmith and many other things—the Bechuana, a teachable people, made remarkable progress, many becoming Christians. Among other things Moffat reduced the Bechuana language to writing. He was joined in 1841 by David Livingstone (*q.v.*), who later on began the systematic exploration of the northern regions. The connection between Cape Colony and Bechuanaland became close and the Cape law courts from 1836 onward claimed jurisdiction in southern Bechuanaland. The Bechuana chiefs were, however, regarded as independent. When, by the Sand River Convention of 1852, the British Government acknowledged the independence of the Transvaal Boers, no frontier was indicated save the Vaal river and the Boers soon began to encroach upon the lands of the Bechuana.

The Struggle with the Boers.—This was the beginning of a struggle which lasted for over 30 years. Livingstone quickly perceived the importance of the matter. It was not only the Bechuana that the Boers sought to subdue; the future of the territories to the north was at stake. The Boers had attacked Sechele, chief of the Bakwena tribe, and had looted the European stores and Livingstone's house at Kolobeng (Sechele's capital) and they endeavoured to stop traders and missionaries going north. "The Boers," wrote Livingstone in his *Missionary Travels* (1857 ed., p. 39) "resolved to shut up the interior and I determined to open the country." Moffat, on his part, complained in 1858 to Sir George Grey, the governor of Cape Colony, and the molestation of British subjects going north was stopped. Claims by the Boers to tax the Barolong tribe were made later and this, in 1870, led their chief, Montsioa, to threaten to appeal to the British for redress. To this the Boers replied by sending President Pretorius and Paul Kruger to meet Montsioa (Aug. 1870). They invited the Barolong to join the Transvaal to save their territory from becoming British, to which Montsioa answered "No one ever spanned in an ass with an ox in one yoke" The Boer and Bechuana claims were submitted to Mr. R. W. Keate, lieutenant-governor of Natal. He awarded certain lands to the Transvaal, but not Montsioa's territory. Nevertheless attacks upon and intrigues against the Barolong continued and in 1874 Montsioa asked to be taken under British protection. Two years later (Aug. 1876) Khama, chief of the Bamangwato, the largest and most important Bechuana tribe, made a similar request. In his letter to the high commissioner, Khama declared the Boers were coming into his country and he did not like them. "Their actions are very cruel among us black people" (he said). "We are like money, they sell us and our children."

These representations by the Barolong and the Bamangwato, supported by the representations of Cape politicians, led, in 1878, to the occupation of southern Bechuanaland by a British force under Colonel (afterwards General Sir Charles) Warren. A small police force continued to occupy the district until April 1881, but the home government refused to take the country under British protection. On the withdrawal of the police, southern Bechuanaland fell into a state of anarchy. The Transvaal War of that date offered opportunities to the freebooting Boers of the west which were not to be lost. In 1882 they set up the republic of Stellaland, with Vryburg as its capital, and forthwith proceeded to establish the republic of Goshen, farther north, in spite of the protests of Montsioa, and established a small town called Rooi Grond as capital. In South Africa, as well as in England, strong feeling was aroused by this aggression. By the London Convention of Feb. 1884, part of eastern Bechuanaland was included in Boer territory but further expansion was prohibited. In spite of the convention the Boers remained in Stellaland and Goshen—which were west of the new Transvaal frontier—and in April 1884 the Rev. John Mackenzie, who had succeeded Livingstone, was sent to the country to arrange matters. This proved, with the limitations imposed upon Mackenzie, an impossible task; he was accused of being too "pro-Bechuana" and was recalled (July 30). In his place Cecil Rhodes was sent out as deputy commissioner. Rhodes was then leader of the opposition in the Cape Parliament and in that assembly had protested against allowing the Transvaal "and its allies"—an allusion to the German backing

the Boers then had—"to acquire the whole of the interior. Bechuanaland was the neck of the bottle . . . and we [the Cape Colony] must secure it." Rhodes's mission like that of Mackenzie was, however, a failure. While he was in Goshen, Commandant P. J. Joubert entered the country and attacked Montsioa. Declaring that the Boers were making war on Great Britain, Rhodes returned to Cape Town. The Cape ministry of the day was controlled by the Afrikaner Bond (*q.v.*) and while willing to secure Bechuanaland was very unwilling to offend the Transvaal Boers. But when on Sept. 10, 1884, the Boers proclaimed the country under the protection of the Transvaal a crisis was reached.

British Protectorate Established.—This breach of the London convention, "made," said President Kruger, "in the interests of humanity," provoked strong indignation in Great Britain, while the high commissioner in South Africa, Sir Hercules Robinson, supported by Rhodes, counselled prompt measures. Action was indeed inevitable and Sir Charles Warren was again sent out, this time to clear Bechuanaland of the filibusters. Before Sir Charles Warren reached Africa, Sir Thomas Upington, the Cape premier, and Sir Gordon Sprigg, the treasurer-general, went to Bechuanaland and arranged a "settlement" which would have left the Boer filibusters in possession, but the Imperial Government refused to take notice of this "settlement." Sir Charles Warren's force—4,000 strong—had reached the Vaal river in Jan. 1885. On Jan. 22 Kruger met Warren at the Modder river, and endeavoured to stop him from proceeding farther. Warren, however, continued his march, and without firing a shot broke up the republics of Stellaland and Goshen. On Sept. 30, 1885, Bechuanaland was formally taken under British protection. That portion lying to the south of the Molopo river was described as British Bechuanaland, and was constituted a crown colony. In 1895 this district was annexed to Cape Colony.

The rest of the country became the Bechuanaland Protectorate and was administered as a crown colony. A proposal in 1895 that the protectorate should come under the rule of the British South Africa Company was frustrated by the opposition of Khama and other chiefs and by the occurrence of the Jameson Raid, the raiders having started from Bechuana territory. Reserves were set aside for the various tribes, who, under the control of a resident commissioner, possess autonomy. A railway linking the Cape railways to Rhodesia was built near the eastern border of the protectorate, and along this railway white settlements grew up. When the Union of South Africa was formed, in 1910, the protectorate remained under direct imperial rule. The majority of the white settlers, however, gradually came to wish to join the Union and in Dec. 1924 Gen. Hertzog (then prime minister of the Union) stated that in his opinion the time had come for considering the incorporation of the protectorate in the Union. In 1927 efforts by the white settlers in this direction met with discouragement from the imperial authorities.

A notable event was the death of Khama in Feb. 1923, aged about 93. Converted to Christianity in 1860, a great advocate of temperance and of education, he had been paramount chief of the Bamangwato since 1875. The chief Montsioa had died in 1911; Linchwe, chief of the Bakgatla, a wise and good ruler, the last survivor of the chiefs who ruled before the country came under British protection, died in Oct. 1924.

BIBLIOGRAPHY.—The early chapters of David Livingstone's *Missionary Travels in South Africa* (1857) are invaluable. Other first-hand authorities are: J. Campbell, *Travels in South Africa* (1815); *Travels . . . a Second Journey . . .* (1822); Robert Moffat, *Missionary Labours and Scenes in Southern Africa* (1842); A. A. Anderson, *Twenty-five Years in a Waggon in the Gold Regions of Africa*, vol. i. (1887). See also, John Mackenzie, *Austral Africa, Losing it or Ruling it* (1887); J. D. Hepburn, *Twenty Years in Khama's Country* (1895); W. D. Mackenzie, *John Mackenzie* (1902); histories dealing with South Africa as a whole, and the Annual Report, *Bechuanaland Protectorate*, issued by the Colonial Office, London. (See also SOUTH AFRICA, UNION OF.) (F. R. C.)

BECK, CHRISTIAN DANIEL (1757–1832), German philologist, historian, theologian and antiquarian, was professor of Greek and Latin literature, and later of history, at Leipzig. He edited Pseudo-Albinovanus (1783), Pindar and the Scholia (1792–95), Aristophanes (with others, 1794, etc.), Euripides

(1778–88), Apollonius Rhodius (1797), Demosthenes, *De Pace* (1799), Plato (1813–19), Cicero (1795–1807), Calpurnius Siculus (1803). He translated Ferguson's *Fall of the Roman Republic* and Goldsmith's *History of Greece*, and added two volumes to Bauer's *Thucydides*.

See Nobbe, *Vita C.D. Beckii* (1837); and G. Hermann, *Opuscula*, v. 312.

BECK (or BEEK), DAVID (1621–1656), Dutch portrait-painter, was born at Arnheim in Guelderland. He was trained by Van Dyck and worked as his assistant until Van Dyck's death. Most of his work was done in England and Sweden. He was appointed portrait-painter and chamberlain to Queen Christina of Sweden.

BECK, JAKOB SIGISMUND (1761–1840), German philosopher, born at Danzig and educated at Königsberg, became professor of philosophy at Halle and at Rostock. He devoted himself to interpreting the doctrine of Kant, and in 1793 published the *Erläuternder Auszug aus Kants kritischen Schriften*, a compendium of Kantian doctrine, in which certain of the Kantian contradictions are explained on the supposition that much of the language is used in a popular sense for the sake of intelligibility. Beck maintains that Kant's theory is really an idealism, asserting that knowledge of objects outside the domain of consciousness is impossible, and that nothing positive remains when we have removed the subjective element. Matter is deduced by the "original synthesis." Similarly, the idea of God is a symbolical representation of the guiding voice of conscience. The value of Beck's exegesis has been to a great extent overlooked owing to the attention given to the work of Fichte. Beside the *Erläuternder Auszug*, he published the *Grundriss der krit. Philosophie* (1796), containing an interpretation of the Kantian *Kritik* in the manner of Salomon Maimon.

See Ueberweg, *Grundriss der Gesch. der Philos. der Neuzeit* (1914); Dilthey, in the *Archiv für Geschichte der Philos.*, vol. ii, pp. 502–650 (1889). For Beck's letters to Kant, see R. Reicke, *Aus Kants Briefwechsel* (Königsberg, 1885).

BECKENHAM, urban district, Kent, England, 10m S S E. of London by the Southern railway. Pop. (1881) 13,045; (1921) 33,345. It is a long straggling parish extending from the western tower of the Crystal Palace almost to the south end of Bromley, and contains the residential suburb of Shortlands. Its rapid increase in size since the last decade of the 19th century has been due to its attractions with wide thoroughfares and handsome residences in extensive grounds. The church of St. George was built in 1866 on the site of an ancient Perpendicular church.

BECKER, HEINRICH (1770–1822), German actor, whose real name was BLUMENTHAL, was born at Berlin. He obtained, while quite a young man, an appointment in the court theatre at Weimar, at that time under Goethe's auspices. The poet appointed him stage-manager, entrusted him with leading parts, and consulted him on the staging of his plays. Becker, although he was at his best in comedy, played Vansen in *Egmont*, the leading parts of several of Schiller's plays—notably *Burleigh in Maria Stuart*, Karl Moor in *Die Räuber*, and Antonio in *Torquato Tasso*. Becker left Weimar in the spring of 1800, played for a short time at Hamburg (under Schröder) and at Breslau, and then began a wandering life. Broken in health and ruined in fortune he returned in 1820 to Weimar, where he died in 1822.

Becker was twice married. His first wife, CHRISTIANE LUISE AMALIE BECKER (1778–97), played Euphrosyne in the opera *Das Petermännchen*, and it is under this name that Goethe immortalized her in a poem which first appeared in Schiller's *Musen Almanach* of 1799.

BECKER, HUGO (1864–), German violoncellist, was born at Strasbourg on Feb. 13, 1864, the son of Jean Becker, the violinist, founder of the Florence Quartet. In his youth Hugo toured with his father. In 1883 he became solo violoncellist at the Frankfurt opera, and teacher at the Conservatoire. In 1909 he removed to the Hochschule at Charlottenburg, Berlin.

BECKER, WILHELM ADOLF (1796–1846), German classical archaeologist, was born in Dresden. In 1842 he was appointed professor of archaeology at Leipzig. The works by

which Becker is most widely known are the *Gallus or Römische Scenen aus der Zeit Augusts* (1838, new ed. by Göll, 1880–82) and the *Charicles or Bilder altgriechischer Sitte* (1840, new ed. by Göll, 1877–78), which describe the everyday life of the ancient Greeks and Romans in the form of a romance. More important is the great *Handbuch der rom. Alterthümer* (1843–68), completed after Becker's death by Marquardt and Mommsen. Other works of his are *De Comicis Romanorum Fabulis* (1837), *De Romae Veteris Muris atque Portis* (1842), *Die römische Topographie in Rom* (1844), and *Zur römischen Topographie* (1845).

BECKET, THOMAS (1118–1170), by his contemporaries more commonly called Thomas of London, English chancellor and archbishop of Canterbury under Henry II. His mother was a native of Caen; his father, who came of a family of small Norman landowners, had been a citizen of Rouen, but migrated to London before the birth of Thomas, and held at one time the dignified office of port-reeve, although he ended his life in straitened circumstances. The young Thomas received an excellent education. At the age of ten he was put to school with the canons of Merton

THE NORTH TRANSEPT OR "MARTYRDOM" OF CANTERBURY CATHEDRAL WHERE THOMAS BECKET WAS MURDERED, DEC. 29, 1170

priory in Surrey. Later he spent some time in the schools of London, which enjoyed at that time a high reputation, and finally studied theology at Paris. Returning at the age of 22 he was compelled, through the misfortunes of his parents, to become a notary in the service of a wealthy kinsman, Osbert Huit Deniers, who was of some importance in London politics. About 1142 a family friend brought Thomas under the notice of Archbishop Theobald, of whose household he at once became an inmate. He accompanied the primate to Rome in 1143, and also to the council of Reims (1148), which Theobald attended in defiance of a prohibition from the king. It appears to have been at some time between the dates of these two journeys that he visited Bologna and Auxerre, and began those studies in the canon law to which he was largely indebted for his subsequent advancement and misfortunes. Although the bent of his mind was legal, he never made himself an expert jurist; but he had the art of turning his knowledge, such as it was, to excellent account. In 1151 he was sent to Rome by the archbishop with instructions to dissuade the Curia from sanctioning the coronation of Stephen's eldest son Eustace. It is said that Thomas distinguished himself by the ability with which he executed his commission; in any case it gave him a claim on the gratitude of the Angevin party which was not forgotten. In 1154 he was promoted to be archdeacon of Canterbury, after first taking deacon's orders. In the following year, Henry II., at the primate's recommendation, bestowed on him the important office of chancellor. In this capacity Thomas controlled the issue of royal writs and the distribution of ecclesiastical patronage; but it was more important for his future that he had ample opportunities of exercising his personal fascination upon a prince who was comparatively inexperienced, and 13 or 14 years his junior. He became Henry's bosom friend and was consulted in all affairs of state. It had been the hope of Theobald that Becket's influence would be exercised to support the extensive privileges which the church had wrested from Stephen. But the chancellor, although preserving friendly relations with his old patron, subordinated the interests of the church to those of his new master. Under his administration the church was severely taxed for the prosecution of Henry's foreign wars; and the chancellor incurred the reproach "of plunging his sword into the bowels of his

mother." Like Wolsey later he identified himself with the military aspirations of his sovereign. It was Thomas who organized the Toulouse campaign of 1159; even in the field he made himself conspicuous by commanding a company of knights, directing the work of devastation, and superintending the conduct of the war after the king had withdrawn his presence from the camp. When there was war with France upon the Norman border, the chancellor acted as Henry's representative; and on one occasion engaged in single combat and unhorsed a French knight of reputation. Later it fell to his part to arrange the terms of peace with France. He discharged the duties of an envoy with equal magnificence and dexterity; the treaty of May 1160, which put an end to the war, was of his making.

In 1162 he was transferred to a new sphere of action. Henry bestowed on him the see of Canterbury, left vacant by the death of Theobald. The appointment caused some murmurs; since Becket, at the time when it was made, was still a simple deacon. But it had been desired by Theobald as the one means of averting an attack on clerical privileges which had been impending almost since the accession of Henry II; and the bishops accepted it in silence. Henry on his side looked to find in Becket the archbishop a coadjutor as loyal as Becket the archdeacon; and anticipated that the church would once more be reduced to that state of dependence in which she had stood during the latter years of Henry I. Becket, however, disappointed all the conflicting expectations excited by his appointment. He did not allow himself to be made the king's tool; nor on the other hand did he attempt to protect the church by humouring the king in ordinary matters. He devoted himself to ascetic practices, confined himself to the society of churchmen, and resigned the chancellorship in spite of a papal dispensation (procured by the king) which authorized him to hold that office concurrently with the primacy. By nature a violent partisan, the archbishop now showed himself the uncompromising champion of his order and his see. Hence he was on the worst of terms with the king before a year had elapsed. They came into open conflict at the council of Woodstock (July 1163), when Becket successfully opposed the king's proposal that a land-tax, known as the sheriff's aid, which formed part of that official's salary, should be henceforth paid into the exchequer. But there were more serious differences in the background. Becket had not shrunk from excommunicating a tenant-in-chief who had encroached upon the lands of Canterbury, and had protected against the royal courts a clerk named Philip de Brois who was charged with an assault upon a royal officer. These disputes involved questions of principle which had long occupied Henry's attention, and Becket's defiant attitude was answered by the famous Constitutions of Clarendon (*q.v.*) in which the king defined, professedly according to ancient use and custom, the relations of church and State. Becket and the bishops were required to give these constitutions their approval. Henry's demands were more defensible in substance than might be supposed from the manner in which he pressed them on the bishops. On the most burning question, that of criminous clerks, he offered a compromise. He was willing that the accused should be tried in the courts Christian provided that the punishment of the guilty were left to the lay power. Becket's opposition rested upon a casuistic interpretation of the canon law, and an extravagant conception of the dignity attaching to the priesthood; he showed, moreover, a disposition to quibble, to equivocate, and to make promises which he had no intention of fulfilling. His conduct may be excused on the ground that the bishops were subjected to unwarrantable intimidation. But when he renounced his promise to observe the constitutions his conduct was reprobated by the other bishops, although approved by the pope. It was fortunate for Becket's reputation that Henry punished him for his change of front by a systematic persecution in the forms of law. The archbishop was thus enabled to invoke the pope's assistance, and to quit the country with some show of dignity.

Becket fled to France in Nov. 1164. He at once succeeded in obtaining from Alexander III. a formal condemnation of the constitutions. But Alexander, a fugitive from Italy and menaced by an alliance of the emperor with an anti-pope, was indisposed to

take extreme measures against Henry; and six years elapsed before the king found himself definitely confronted with the choice between an interdict and a surrender. For the greater part of this time the archbishop resided at the Burgundian monastery of Pontigny, constantly engaged in negotiations with Alexander, whose hand he desired to force, and with Henry, from whom he hoped to extract an unconditional submission. In 1166 Becket received from the pope a commission to publish what censures he thought fit; of which he at once availed himself to excommunicate the king's principal counsellors. In 1169 he took the same step against two of the royalist bishops. In more sweeping measures, however, the pope refused to support him, until in 1170 Henry infringed the rights of Canterbury by causing Archbishop Roger of York to crown the young king. In that year the threats of the pope forced Henry to a reconciliation which took place later at Fréteval on July 22. It was a hollow truce, since the subject of the constitutions was not mentioned; and Thomas returned to England with the determination of riding roughshod over the king's supporters. If he had not given a definite pledge to forgive the bishops who had taken part in the young king's coronation, he had at least raised expectations that he would overlook all past offences. But the archbishop prevailed upon the pope to suspend the bishops, and before his return published papal letters which, in announcing these sentences, spoke of the constitutions as null and void. It was only to be expected that such a step, which was virtually a declaration of war against the king, should arouse in him the strongest feelings of resentment. The archbishop's murder, perpetrated within a month of his return to England (Dec. 29, 1170), was, however, the work of over-zealous courtiers and regretted by no one more than Henry.

Becket was canonized in 1172. Within a short time his shrine at Canterbury became the resort of innumerable pilgrims. Plenary indulgences were given for a visit to the shrine, and an official register was kept to record the miracles wrought by the relics of the saint. The shrine was magnificently adorned with the gold and silver and jewels offered by the pious. It was plundered by Henry VIII., to whom the memory of Becket was specially obnoxious; but the reformers were powerless to expunge the name of the saint from the Roman calendar, on which it still remains. Even to those who are in sympathy with the principles for which he fought, the posthumous reputation of Becket must appear strangely exaggerated. It is evident that in the course of his long struggle with the State he fell more and more under the dominion of personal motives. At the last he fought not so much for an idea as for the humiliation of an opponent by whom he had been ungenerously treated. William of Newburgh appears to express the verdict of the most impartial contemporaries when he says that the bishop was *zelo justitiæ fervidus, utrum autem plene secundum scientiam novit Deus*: "burning with zeal for justice, but whether altogether according to wisdom God knows."

BIBLIOGRAPHY.—The correspondence of Becket and most of the contemporary biographies are collected by J. C. Robertson in *Materials for the History of Thomas Becket* (Rolls Series, 1875-85). See also the *Vie de Saint Thomas*, by Garnier de Pont Sainte Maxence (1859), and for the chronology of the controversy, Eyton's *Itinerary of Henry II.* Among modern authorities are: Morris, *Life and Martyrdom of St. Thomas Becket* (1885); Lhuillier, *Saint Thomas de Cantorbéry* (1891-92); J. C. Robertson, *Becket* (1859); F. W. Maitland, *Roman Canon Law in the Church of England*, c. iv.; J. A. Froude in his *Short Studies*, vol. iv., and Freeman in his *Historical Essays* (1871), give noteworthy but conflicting appreciations.

(H. W. C. D.)

BECKFORD, WILLIAM (1709-1770), alderman of the city of London, was Lord Mayor in 1762 and 1769. He was one of the chief organizers of the city's opposition to the dominance of Lord Bute, and afterwards to the encroachments of George III. Though publicly ridiculed for his grammar and accent, he was feared for his great wealth and independence. In 1768 he brought all his influence to bear in support of Wilkes and on the latter's instigation broke through all court etiquette in 1770 when presenting a city remonstrance to the king against his arbitrary conduct: George having rejected the petition in a discourteous manner, Beckford appalled the courtiers by "answering back" in a firm but respectful speech whose approximate words are engraved

on his monument in the Guildhall. His son was also named William Beckford (q.v.).

BECKFORD, WILLIAM (1760–1844), the author of *Vathek*, was born on Oct. 1, 1760, and at the age of 11 inherited a princely fortune from his father, Alderman Beckford. He studied architecture under Sir W. Chambers and music under Mozart. In 1780 he published *Biographical Memoirs of Extraordinary Painters*, and in the same year went to Holland, Germany, Austria and Italy. He married Lady Margaret Gordon in 1783, and spent his brief married life in Switzerland. In 1783 also, his first travel book, *Dreams, Waking Thoughts and Incidents*, was printed, but he suppressed the whole edition, save six copies. After his wife's death (1786) he travelled in Spain and Portugal. In 1797 he published *Azemia* and in 1796, *Modern Novel Writing*, both satires on the minor novel. After his return to England he sold his old house, Fonthill Abbey, Wiltshire, and began to build a magnificent residence on which he expended in about 18 years the sum of £273,000. He was a famous collector of books, pictures and objects of applied art. His eccentricities, together with the strict seclusion in which he lived, gave rise to scandal, probably unjustified. In 1822 he sold his house, together with its splendid library (he had bought Gibbon's library at Lausanne), to John Farquhar, and soon after one of the towers, 260ft. high, fell, destroying part of the villa in the ruins. Beckford built another great house on Lansdown Hill, near Bath, where he lived until his death. Beckford's great wealth and his endless eccentricities inevitably had their effect on the popular imagination, and probably added zest to the appreciation of his one great achievement, *Vathek*. But the extraordinary power of this short book of less than 40,000 words gives him a place of his own in 18th century literature. *Vathek* is an oriental tale of a megalomaniac Arabian caliph who gives himself to the service of Eblis (the devil), moves from crime to crime, and in the end finds himself, with the beautiful Nouronihar, in the splendours of the hall of Eblis, tormented with a burning heart. *Vathek* was written by Beckford in French, and the translation, by the Rev. Samuel Henly, appeared in 1786, before the original, against Beckford's orders. The French translation appeared at Lausanne in 1787, and a revision thereof at Paris in the same year. A second revision of the French version was published in London in 1815. The accompanying episodes to the main story were not published during his lifetime. *Vathek* stands apart from the numerous oriental tales of the time by what Mr. Saintsbury has called the "sombre magnificence" of the end, pages which are "hard to parallel in the later literature of prose fiction." In 1834 Beckford published *Italy; with Sketches of Spain and Portugal*, a compressed and revised version of *Dreams, Waking Thoughts and Incidents*. In 1835 he issued perhaps his best travel book, *Recollections of an Excursion to the Monasteries of Alcobaca and Batalha*—a journey made in 1794. Beckford had a seat in parliament from 1784 to 1793, and again from 1806 to 1820. He left two daughters, the elder of whom was married to the 10th duke of Hamilton.

See Cyrus Redding, *Memoirs of William Beckford of Fonthill* (1859); S. Mallarmé's preface to *Le Vathek de Beckford*, a reprint of the Paris edition (1876); Dr. R. Garnett's introduction to his edition of *Vathek* (1893); Lewis Melville, *Life and Letters of William Beckford* (1910); S. Lane-Poole, "The Author of *Vathek*," in the *Quarterly Review* (Oct. 1910); *The Episodes of Vathek*, trans. by Sir F. T. Marzials, introd. by Lewis Melville (1912); Herbert B. Grimsditch, "William Beckford's Minor Works" in the *London Mercury* (Oct. 1926).

BECKINGTON or BEKYNTON, THOMAS (c. 1390–1465), English statesman and prelate, was born at Beckington in Somerset, and was educated at Winchester and New College, Oxford. Having entered the church he held many ecclesiastical appointments, and became dean of the Arches in 1423; then devoting his time to secular affairs he was sent on an embassy to Calais in 1439, and to John IV., count of Armagnac, in 1442. At this time Beckington was acting as secretary to Henry VI., and soon after his return in 1443 he was appointed lord privy seal and bishop of Bath and Wells. The bishop erected many buildings in Wells, and died there on the 14th of January 1465.

The most important results of Beckington's missions to France were a Latin journal, written by himself, referring to the embassy to Calais; and another, written by one of his attendants, relating to the journey to Armagnac.

Beckington's own journal is published in the *Proceedings of the Privy Council*, vol. v., edited by N. H. Nicolas (1835); and the other journal in the *Official Correspondence of Thomas Bekynnton*, edited by G. Williams for the Rolls Series (1872), which contains many interesting letters. This latter journal has been translated into English by N. H. Nicolas (1828). See G. G. Perry, "Bishop Beckington and Henry VI.," in the *English Historical Review* (1894).

BECKLEY, a rapidly growing city in the midst of the "smokeless" coal-fields and heavy timber stands of West Virginia, U.S.A., 72m. S.E. of Charleston; the county seat of Raleigh county. It is on Federal Highways 19 and 21, and is served by the Chesapeake and Ohio and the Virginian railways. Its population was 342 in 1900; 4,149 in 1920; and about 10,000 in 1925. It lies on a broad plateau of the Alleghenies, 2,500ft. above sea-level, in a picturesque setting, and has a delightful summer climate. Primarily it is a trading and social centre for the extensive mining and lumbering undertakings in the neighbourhood. The assessed valuation of property in 1925 was \$7,202,548, and the resources of the four banks amounted to \$8,000,000.

BECKMANN, JOHANN (1730–1811), German technologist, was born on June 4, 1739, at Hoya, Hanover. After two years spent in St. Petersburg (Leningrad), teaching in the German Lutheran school maintained by A. F. Büsching there, and a year's travel in Scandinavia, he began to lecture at Göttingen university on the arts and sciences. Beckmann contemplated a complete technical history of the arts and sciences and may be said to be the father of technological science. He became full professor in 1770 and died at Göttingen on Feb. 3, 1811. His *Beiträge zur Geschichte der Erfindungen* (1780–1805), was translated into English as the *History of Inventions*. Other important works are: *Entwurf einer allgemeinen Technologie* (1806); *Anleitung zur Handelswissenschaft* (1789); *Vorbereitung zur Warenkunde* (1795–1800); *Beiträge zur Ökonomie, Technologie, Polizei- und Kameralwissenschaft* (1777–91).

BECKUM, chief town of a south-eastern sub-division in the district of Münster, in the Prussian province of Westphalia. Pop. (1925) 10,707. Brewing, distilling, and lime-burning are the main industries.

BECKWITH, SIR THOMAS SYDNEY (1772–1831), British general, in 1791 entered the 71st Regiment in which he served in India and elsewhere until 1800, when he obtained a company in Col. Coote Manningham's experimental regiment of riflemen. In 1802 he was promoted major and in the following year lieutenant-colonel. Beckwith aided Sir John Moore in the training of the troops which afterwards became the Light Division. In 1806 he served in the expedition to Hanover and in 1807 in that which captured Copenhagen. Beckwith took part in the great march of Craufurd to the field of Talavera, in the advanced guard fights on the Coa in 1810 and in the campaign in Portugal. On the formation of the Light Division he was given a brigade command in it. After the brilliant action of Sabugal, Beckwith had to retire for a time from active service. In 1812 he went to Canada as assistant quartermaster-general, and he took part in the war against the United States. In 1814 he became major-general, and in 1815 was created Knight Commander of the Bath. In 1827 he was made colonel commandant of the Rifle Brigade. He went to India as commander-in-chief at Bombay in 1829, and was promoted lieutenant-general in the following year. He died on Jan. 15 1831, at Mahabeshwar.

His elder brother, Sir **GEORGE BECKWITH** (1753–1823), served in the American War of Independence, and was made governor of Bermuda 1797, and of St. Vincent in 1804. As governor of Barbados (1808–14) he captured the French islands of Martinique (1809) and Guadeloupe (1810). Sir George Beckwith commanded the forces in Ireland, 1816–20. He died in London on March 20 1823.

BECKWITH, JAMES CARROLL (1852–1917), American portrait-painter, was born at Hannibal (Mo.), on Sept. 23, 1852. He studied at the National Academy of Design, New York

city, and in Paris (1873-78) under Carolus Duran. Returning to the United States in 1878, he gradually became a prominent figure in American art. He took an active part in the formation of the Fine Arts Society, and was president of the National Free Art League, which attempted to secure the repeal of the American duty on works of art. Among his portraits are those of W. M. Chase (1882), of Miss Jordan (1883), of Mark Twain, T. A. Janvier, Gen. Schofield and William Walton. In 1904 he exhibited at St. Louis "The Nautilus" and a portrait of Mrs. Beckwith. Yale university, Johns Hopkins university, and the New York public library have examples of his works, and the New York public library has a collection of his crayon and pencil drawings. He died in New York on Oct. 24, 1917.

BECKX, PIERRE JEAN (1795-1887), general of the Society of Jesus, was born at Sichem, Belgium, on Feb. 8, 1795, and entered the novitiate of the order at Hildesheim in 1810. He was head of the order from 1853 to 1883. His tenure of office was marked by an increased zeal for missions in Protestant lands, and by the removal of the Society's headquarters from Rome to Fiesole near Florence in 1870. His chief literary work was the often-translated *Month of May* (Vienna, 1843). He died at Rome on March 4, 1887.

BECQUE, HENRY FRANÇOIS (1837-1899), French dramatist, was born in Paris. He wrote the book of an opera *Sardanapale*, adapted from Byron, for the music of M. Victorin Joncières in 1867, but his first important work, *Michel Pauper*, appeared in 1870. The importance of this sombre drama was first realized when it was revived at the Odéon in 1886. *Les Corbeaux* (1882) established Becque's position as an innovator, and in 1885 he produced his most successful play, *La Parisienne*. Becque produced little during the last years of his life, but his disciples carried on the tradition he had created. He died in May, 1899, and his collected works, *Théâtre Complet* (3 vols.) appeared in that year.

See his *Querelles littéraires* (1890), and *Souvenirs d'un auteur dramatique* (1895), consisting chiefly of reprinted articles in which he does not spare his opponents.

BÉCQUER, GUSTAVO ADOLFO (1836-1870), Spanish poet and romance-writer, was born at Seville, and died in great poverty at Madrid, where he had earned a precarious living by translating foreign novels. His works were published posthumously in 1873 (7th ed. 1911). In such prose tales as *El Rayo de Luna* and *La Mujer de piedra*, Bécquer is manifestly influenced by Hoffmann, and as a lyric poet he has analogies with Heine.

See Fr. Schneider, *G. A. Bécquer* (1914).

BECQUEREL, the name of a French family, several members of which have been distinguished in chemical and physical research.

ANTOINE CÉSAR BECQUEREL (1788-1878) was born at Châtillon sur Loing on March 8, 1788. After passing through the École Polytechnique he became *ingénieur-officier* in 1808, and saw active service with the imperial troops in Spain from 1810 to 1812, and again in France in 1814. He then resigned from the army. His earliest scientific work was in mineralogy, but he soon turned his attention to the study of electricity and especially of electrochemistry. In 1837 he received the Copley medal from the Royal Society "for his various memoirs on electricity, and particularly for those on the production of metallic sulphurets and sulphur by the long-continued action of electricity of very low tension," which it was hoped would lead to increased knowledge of the "recomposition of crystallized bodies, and the processes which may have been employed by nature in the production of such bodies in the mineral kingdom." In biological chemistry he worked at the problems of animal heat and at the phenomena accompanying the growth of plants, and he also studied meteorological questions and observations. His works include: *Traité d'électricité et du magnétisme* (1834-40), *Traité de physique dans ses rapports avec la chimie* (1842), *Éléments de l'électro-chimie* (1843), *Traité complet du magnétisme* (1845), *Éléments de physique terrestre et de météorologie* (1847), and *Des climats et de l'influence qu'exercent les sols boisés et déboisés* (1853). He died on Jan. 18, 1878, in Paris, where from 1837 he had been professor of physics at the Musée d'Histoire Naturelle.

His son, **ALEXANDRE EDMOND BECQUEREL** (1820-91), was born in Paris on March 24, 1820, and was in turn his pupil, assistant and successor at the Musée d'Histoire Naturelle; he was also appointed professor at the short-lived Agronomic Institute at Versailles in 1849, and in 1853 received the chair of physics at the Conservatoire des Arts et Métiers. Edmond Becquerel paid special attention to the study of light, investigating the photochemical effects and spectroscopic characters of solar radiation and the electric light, and the phenomena of phosphorescence, particularly as displayed by the sulphides and by compounds of uranium. In connection with these latter inquiries he devised his phosphoroscope, an apparatus which enabled the interval between exposure to the source of light and observation of the resulting effects to be varied at will and accurately measured. He published in 1867-68 a treatise in two volumes on *La Lumière, ses causes et ses effets*. He also investigated the diamagnetic and paramagnetic properties of substances and the phenomena of electrochemical decomposition; and proposed a modified statement of Faraday's law which was intended to cover certain apparent exceptions. He died in Paris on May 11, 1891.

His son, **ANTOINE HENRI BECQUEREL** (1852-1908), who succeeded to his father's chair at the Musée d'Histoire Naturelle in 1892, was born in Paris on Dec. 15, 1852, studied at the École Polytechnique (where he was appointed a professor in 1895), and in 1875 entered the department *des ponts et chaussées*, of which in 1894 he became *ingénieur en chef*. He was the discoverer of radioactivity, having found in 1896 that uranium at ordinary temperatures emits an invisible radiation which in many respects resembles Röntgen rays, and can affect a photographic plate after passing through thin plates of metal. For these researches he was in 1903 awarded a Nobel prize jointly with Pierre Curie. He also engaged in work on magnetism, the polarization of light, phosphorescence and the absorption of light in crystals. He died at Croisic in Brittany on Aug. 25, 1908.

BECQUEREL RAYS, the rays, discovered by A. H. Becquerel (*q.v.*), which are given off by uranium. These have the same type of penetrating power and electrical and photographic action as the Röntgen or X-rays, and the γ -rays, but are very much more feeble in their action. (See RADIOACTIVITY.)

BED, a general term for a resting or sleeping place for men and animals, and in particular for the article of household furniture for that object, and so used by analogy in other senses, involving a supporting surface or layer (a word of Teutonic origin, *cf.* Ger. Bett) Assyrians, Medes and Persians had beds of stone, wood or metal and frequently decorated their furniture with inlays or *appliqués* of metal, mother-of-pearl and ivory.

Greek and Roman Beds.—The Greek bed had a wooden frame, with a board at the head and bands of hide laced across, upon which skins were placed. At a later period the bedstead was often veneered with expensive woods; sometimes it was of solid ivory veneered with tortoise-shell and with silver feet; often it was of bronze. The pillows and coverings also were costly and beautiful. Small cushions were placed at the head and sometimes at the back of the Roman beds. The bedsteads were high and could only be ascended by the help of steps. They were often arranged for two persons, and had a board or railing at the back as well as the raised portion at the head. The counterpanes were

THE FRAME OF AN EGYPTIAN BED

sometimes very costly, generally purple embroidered with figures in gold; and rich hangings fell to the ground masking the front. The bedsteads themselves were often of bronze inlaid with silver, and Heliogabalus, like some modern Indian princes, had one of solid silver. In the walls of some of the houses at Pompeii bed niches are found which were probably closed by curtains or sliding partitions. The marriage bed, *lectus genialis*, was much decorated, and was placed in the atrium opposite the door. A low pallet-bed used for sick persons was known as *scimpodium*.

The Middle Ages.—The ancient Germans lay on the floor on beds of leaves covered with skins, or in a kind of shallow chest

filled with leaves and moss. In the early middle ages they laid carpets on the floor or on a bench against the wall, placed upon them mattresses stuffed with feathers, wool or hair, and used skins as a covering. They appear to have generally lain naked in bed, wrapping themselves in the large linen sheets which were stretched over the cushions. In the 13th century luxury increased, and bedsteads were made of wood much decorated with inlaid, carved and painted ornament. They also used folding beds, which served as couches by day and had cushions covered with silk laid upon leather. At night a linen sheet was spread and pillows placed, while silk-covered skins served as coverlets. Curtains were hung from the ceiling or from an iron arm projecting from the wall. In the 12th-century mss. the bedsteads appear much richer, with in-

A BED OF THE CRUSADING PERIOD IN THE 12TH CENTURY

The most outstanding feature of this bed was the inclining mattress. Frames were elaborately decorated and the canopy was newly introduced from the East

reaching to 7 or 8 ft. by 6 or 7 ft. Viollet-le-Duc says that the mattresses were filled with pea-shucks or straw—neither wool nor horsehair is mentioned—but feathers also were used. At this time great personages were in the habit of carrying most of their property about with them, including beds and bed-hangings, and for this reason the bedsteads were for the most part mere frameworks to be covered up; but about the beginning of the 16th century bedsteads were made lighter and more decorative, since the lords remained in the same place for longer periods. Louis XIV. had an enormous number of sumptuous beds, as many as 413 being described in the inventories of his palaces. Some of them had embroideries enriched with pearls, and figures, on a silver or golden ground. The carving was the work of Proux or Caffieri, and the gilding by La Baronnière. The great bed at Versailles had crimson velvet curtains on which "The Triumph of Venus" was embroidered. So much gold was used that the velvet scarcely showed. Under the influence of Madame de Maintenon "The Sacrifice of Abraham," which is now on the tester, replaced "The Triumph of Venus." In the 17th century, which has been called "the century of magnificent beds," the style *à la duchesse*, with tester and curtains only at the head, replaced the more enclosed beds in France, though they lasted much longer in England. In the 18th century feather pillows were first used as coverings in Germany, which in the fashions of the bed and the curious etiquette connected with the bedchamber followed France for the most part. The beds were *à la duchesse*, but in France itself there was great variety both of name and shape—the *lit à alcove*, *lit d'ange*, which had no columns, but a suspended tester with curtains drawn back, *lit à l'Anglaise*, which looked like a high sofa by day, *lit en baldaquin*, with the tester fixed against the wall, *lit à couronne* with a tester shaped like a crown, a style which appeared under Louis XVI., and was fashionable under the Restoration and Louis Philippe, and *lit à l'impériale*, which had a curved tester, are a few of their varieties. The *lit en baldaquin*

of Napoleon I. is still at Fontainebleau, and the Garde Meuble contains several richly carved beds of a more modern date. The custom of the "bed of justice" upon which the king of France reclined when he was present in parliament, the princes being seated, the great officials standing, and the lesser officials kneeling, was held to denote the royal power even more than the throne. Louis XI. is credited with its first use, and the custom lasted till the end of the monarchy.

The Ceremonial Bed.—From the habit of using this bed to hear petitions, etc., came the usage of the *grand lit* which was provided wherever the king stayed, called also *lit de parement* or

lit de parade, rather later. Upon this bed the dead king lay in state. The beds of the king and queen were saluted by the courtiers as if they were altars, and none approached them even when there was no railing to prevent it. These railings were apparently placed for other than ceremonial reasons originally, and in the accounts of several castles in the 15th century mention is made of a railing to keep dogs from the bed. In the *chambre de parade*, where the ceremonial bed was placed, certain persons, such as ambassadors or great lords, whom it was desired to honour, were received in a more intimate fashion than the crowd of courtiers. The *petit lever* was held in the bedroom itself, the *grand lever* in the *chambre de parade*. At Versailles women received their friends in their beds, both before and after childbirth, during periods of mourning, and even directly after marriage—in fact in any circumstances which were thought deserving of congratulation or condolence. During the 17th century this curious custom became general, perhaps to avoid the tiresome details of etiquette. Portable beds were used in high society in France till the end of the *ancien régime*. The earliest of which mention has been found belonged to Charles the Bold (see *Memoirs* of Philippe de Comines). They had curtains over a light framework, and were in their way as fine as the stationary beds.

BY COURTESY OF THE FIELD MUSEUM OF NATURAL HISTORY
EXTERIOR AND INTERIOR VIEWS OF A CHINESE BED OF THE KIEN-LUNG PERIOD, 1736-95

FROM VIOLETT-LE DUC, "DICTIONNAIRE DU MOBILIER FRANÇAIS"

A BED OF THE 15TH CENTURY

Although large, beds of this period were lightly constructed, so that they could be easily carried from place to place. The coverings were often of the finest fabrics

there is a figure of Holofernes together with that of Judith, these being of alabaster). In Scotland, Brittany and Holland the closed bed with sliding or folding shutters has persisted till our own day, and in England—where beds were commonly quite simple in form

Iron beds appear in the 18th century; the advertisements recommend them as free from the insects which sometimes infested wooden bedsteads, but one is mentioned in the inventory of the furniture of the castle of Nerac in 1569, *un lit de fer et de cuivre, avec quatre petites colonnes de laiton, ensemble quatre satyres de laiton, quatre petits vases de laiton pour mettre sur les colonnes; dedans le dit lit il y a la figure d'Olopherne ensemble de Judith, qui sont d'albâtre* (a bed of iron and copper with four small brass columns, together with four brass satyrs and four small brass urns to place on the columns; within the said bed

—the four-poster, with tester and curtains all round, was the usual citizen's bed till the middle of the 19th century. Many fine examples exist of 17th-century carved oak bedsteads, some of which have found their way into museums. The later forms, in which mahogany was usually the wood employed, are much less architectural in design. Some exceedingly elegant mahogany bedsteads were designed by Chippendale, Hepplewhite and Sheraton and there are signs that English taste is returning to the wooden bedstead in a lighter and less monumental form; indeed the most modern type of all, the divan, has reduced the bed to the utmost simplicity of form. (J. P.-B.)

The Modern Metal Bedstead.—The manufacture of metallic bedsteads on a commercial scale began in the Midlands of England, chiefly in and around Birmingham, in the middle of the 19th century, and quickly attained great importance, many types of such sleeping accommodation being exported to almost every country in the world.

The modern demand is for something lighter than the very heavy cast-iron bedstead of the middle 19th century, and this is

FROM MACQUOID AND EDWARDS, "DICTIONARY OF ENGLISH FURNITURE"

A FOUR POSTER BED OF OAK FROM THE TUDOR PERIOD IN ENGLAND
This type of bed, canopied and provided with hangings so that it could be completely curtained in, was common in England for several centuries. The decoration of interlaced strapwork framed in wide pilasters, is indicative of the period

being catered for by much more dainty designs, also by bedsteads the parts of which are welded together, thus disposing of the heavy castings found on the earlier metallic designs. The brass bedstead is still largely used, although wooden bedsteads, of which the patterns are numerous, are generally preferred. Thousands of light iron combination or "single" patterns are exported to different countries, chiefly South Africa; these consist of two "D" shaped ends with galvanized mesh on frame, eliminating the old-fashioned laths and stretcher, and are very easily packed and assembled. They are supplied with portable fourpost tops, with curtain rods for mosquito nets where the conditions demand them. The heavy brass type of bedstead is still sold chiefly to South America. The iron and brass fourposter still finds favour in Egypt and the Far East. Some very beautiful designs in square and round brass tube bedsteads, with pearl and other ornaments, are also in great demand, and are made and finished in many ways; oxidized silver, nickel plate and bronze being popular.

Huge bedsteads resembling houses are occasionally shipped at great cost for the use of Eastern potentates.

The great strides accomplished in medical science have been helped by the supply of bedsteads of all descriptions for hospital use: operating tables, spinal carriages, etc., suitable for any disease, operation or medical requirement. These are hygienically

painted by the spraying process, usually white, and are used extensively in hospitals at home and abroad. Great Britain exported, in 1926, 12,360 tons of bedsteads, valued at £619,900.

Eastern Beds.—In the Near East it has been the custom for years to make beds simply by piling up a number of rugs on the floor of a room. Cushions are also in use, but as a rule the Persian simply reclines upon these piles in some soft garment and makes no use of sheets, blankets or other lighter coverings.

FROM G. WILSON, "CUSTOMS"

THE KURISEE, A TYPE OF BED IN COMMON USE AMONG THE PERSIANS
It consists of a table placed over a pan of burning charcoal and covered with a carpet. The short mattress, pillow and coverlets are folded and kept in a recess during the day

In India the inhabitants live in the open to such an extent that the designing and ornamentation of beds is negligible except for the use of royalty.

In China, however, beds not unlike those of the Egyptians were used some 2,000 years ago and we find replicas of them in pottery in the tombs of the Han period (206 B.C.—A.D. 25). The beds of China reflected the various periods of design just as they did in England and some magnificent specimens have come to light executed in carved wood and in lacquers. During the Ming period (1368–1643), and probably earlier, it became the custom in some sections to enclose the beds with gauze or netting, and later they were made along the back-walls of a small square room with a

AFTER A DRAWING BY JIKICHI

JAPANESE BED

The Japanese sleep between quilts (*futon*) on the *tatami* (mat) covered floor. In the morning the bedding is put in the closet and the room is used for dining

small ante-chamber cut off by sliding doors. An interesting example of this type exists intact in the Field Museum of Natural History in Chicago. These beds were covered with matting and were never as soft and voluptuous as those of the Near East. The pillows were made of wood, porcelain, or stone, carved in such a way as to fit the neck and lower part of the sleeper's head.

In Korea and northern China the *gudeul* or floor is made of flat stones, bricks or earth, with flues under the top layer; some-

what below the level of the floor is a fire-place. When cooking is going on the heat circulates through the flues in the floor and sleeping places are arranged on the warm spots.

In Japan the whole floor about 12 ft. sq., covered with a *tatami* or mat, is a bed. The people sleep between *shiki-futon* or under quilt and *kake-futon* or over quilt. It is warmed during cold weather with a *kotatsu* or little wooden box holding a charcoal burner. The use of the *kotatsu* has disadvantages, often causing skin-diseases, vitiating the air, and sometimes starting fires. For these reasons it is falling into disuse; but whole families may still be found who sleep on the same *tatami*, their feet towards the burner, and their bodies radiating from that point like the spokes of a wheel. (Y. K.)

BED, in geology, a term used when rocks are arranged in more or less distinct layers; these are the beds of rock or strata. Normally the bedding of rocks is horizontal, or very nearly so; when the upper and lower surfaces of a bed are parallel, the bedding is said to be regular; if it is thickest at one point and thins away thence in every direction the bedding is lenticular. Beds may be many feet thick, as in some sandstones, or so thin as to be like sheets of paper; e.g., paper shales, such thin beds being often termed layers or laminae; intermediate regular varieties may be called flags, flagstones, or tilestones. Bedding is confined to rocks which have been formed under water or by the agency of wind; these are the "stratified" rocks.

Where rapidly moving currents of water (or air) are transporting or depositing sand, etc., the bedding is generally not horizontal, but inclined more or less steeply; this brings about the formation of what is variously called "cross-bedding," "diagonal bedding," "current bedding" or, improperly, "false-bedding." (See SEDIMENTARY ROCKS) Igneous materials, when deposited through the agency of water or air, exhibit bedding, but no true stratification is seen in igneous rocks that have solidified after cooling, although in granites and similar rocks the process of weathering frequently produces an appearance resembling this structure. Miners not infrequently describe a bed of rock as a "vein," if it is one that has some economic value; e.g., a vein of coal or ironstone.

BEDAR: see CASTE

BEDARESI, YEDAI AH (1270-1340), Jewish poet, physician and philosopher of Provence. His most successful work was an ethical treatise, *Behinath 'Olam* (Examination of the World), a didactic poem, translated into English by Tobias Goodman.

BÉDARIEUX, town of France, department of Hérault, on the Orb, 27m. N N W of Béziers by rail. Pop. (1926), 7,140. It has a 16th-century church and bridge. Bédarieux is in a zone of woollen and cloth industry based on the sheep-rearing of the hills to the north and north-east, and its cloth-making, carried on under royal privilege from the 17th century to the Revolution, employed, in 1789, 5,000 men, besides many occupied in wool- and cotton-spinning. In spite of modern English machinery, the industry declined with the Levant trade, but it has revived a little with the opening up of coal mines. Bédarieux also has tanneries and leather dressing and it trades in timber and farm produce; it has a board of trade arbitration.

BEDAWI: see BEJA.

BEDAYAT: see NUBA.

BEDAYRIA: see ARABS.

BED-BUG (*Cimex lectularius*), a nocturnal insect parasitic on man, whose blood it sucks. (See BUG; HEMIPTERA)

BEDDGELERT (Gelert's Grave), village, Carnarvonshire, North Wales. Pop. (1921) approx. 1,213. The narrow pass of Aberglaslyn leads into the Snowdon country, and at the foot of that mountain the Colwyn, from the north-west, and the Glaslyn (vale of Gwynant), from the north-east, meet in a picturesque hollow in which the village has grown. Beddgelert has many associations with the princes of North Wales of the early middle ages and is linked with the well-known legend of the faithful hound, Gelert, who protected the prince's sleeping son by killing a wolf, but was killed by the father, who returned to find bloodstains and fancied the dog had slain his child. There are Welsh variants of this tale, which is also well known in other

forms in the folklore of other lands. The finding of a Roman shield, and some direct evidences have led to the view that the Roman trackway from Segontium to Uriconium passed near the village, and Dinas Emrys, an important early native fortification, is situated on a hill about a mile up the valley. The Welsh Highland (light) railway now runs from Dinas Junction, south of Carnarvon, up the Gwyrfaï valley and down that of the Colwyn past Beddgelert to Portmadoc. The village is famed as a tourist centre.

BEDDOES, THOMAS (1760-1808), English physician and scientific writer, was born at Shifnal, Shropshire, on April 13, 1760. After being educated at Bridgnorth grammar school and at Pembroke college, Oxford, he studied medicine in London under John Sheldon (1752-1808). In 1784 he published a translation of L. Spallanzani's *Dissertations on Natural History*, and in 1785 produced a translation, with original notes, of T. O. Bergman's *Essays on Elective Attractions*. He took his degree of doctor of medicine at Oxford in 1786, and, after visiting Paris, where he became acquainted with Lavoisier, was appointed reader in chemistry at Oxford University in 1788. He resigned his readership in 1792. In the following year he published *Observations on the Nature of Demonstrative Evidence*, and the *History of Isaac Jenkins*, a story which powerfully exhibits the evils of drunkenness, and of which 40,000 copies are reported to have been sold. About the same time he began to work at his project for the establishment of a "Pneumatic Institution" for treating disease by the inhalation of different gases. In this he was assisted by Richard Lovell Edgeworth, whose daughter, Anna, became his wife in 1794. In 1798 the institution was established at Clifton, its first superintendent being Humphry Davy, who investigated the properties of nitrous oxide in its laboratory. The institution became an ordinary hospital, and was relinquished by its projector in the year before his death on Dec. 24, 1808.

A life of Beddoes by Dr. John E. Stock was published in 1810.

BEDDOES, THOMAS LOVELL (1803-1840), English dramatist and poet, son of the physician, Thomas Beddoes, was born at Clifton on July 20, 1803. His mother was a sister of Maria Edgeworth, the novelist. He was sent to Bath grammar school and then to the Charterhouse. In 1820 he was entered at Pembroke college, Oxford, and in his first year published *The Improvisatore*, afterwards carefully suppressed, and in 1822 *The Bride's Tragedy*, which showed him as the disciple of the later Elizabethan and Jacobean dramatists. Beddoes was one of the first outside the limited circle of Shelley's own friends to recognize Shelley's genius, and he was certainly one of the earliest imitators of his lyrical method. In the summer of 1824 he met Mrs. Shelley and Walter Savage Landor in Italy. In 1825 he took his degree at Oxford, and in that year began the fantastic and incoherent drama, *Death's Jest Book; or, The Fool's Tragedy*; but he continued to revise it until his death, and it was only published posthumously. He studied anatomy and physiology at Göttingen (1825-29) and at Würzburg (1829-32); and in Zürich practised as a physician until, in 1839, the anti-liberal riots in the town rendered it unsafe for him, and he had to escape secretly. In 1847 he returned to Frankfurt, where he lived with a baker called Degen, to whom he became much attached, and whom he persuaded to become an actor. He took Degen with him to Zürich, where he chartered the theatre for one night to give his friend a chance of playing *Hotspur*. The two separated at Basle, and in a fit of dejection (May 1848) Beddoes tried to bleed himself to death. Later, he took curare, from the effects of which he died on Jan. 26, 1849. His mss. he left in the charge of his friend Kelsall.

In one of his letters to Kelsall Beddoes wrote:—"I am convinced the man who is to awaken the drama must be a bold, trampling fellow—no creeper into worm-holes—no reviser even—however good. These re-animations are vampire cold." In spite of this, Beddoes was himself a "creeper into worm-holes," a close imitator of Marston and of Cyril Tourneur, especially in their familiar handling of the phenomena of death, and in the remoteness from ordinary life of the passions portrayed. In his blank verse he caught, to a certain degree, the manner of his Jacobean models, and his verse abounds in beautiful imagery, but his *Death's Jest Book* is only finished in the sense of having five

acts completed; it remains a bizarre production which appeals to few minds, and to them rather for the occasional excellence of the poetry than as an entire composition. His lyrics show the influence of Shelley as well as the study of 17th century models, but they are by no means mere imitations, and some of them, like the "Dirge for Wolfram" ("If thou wilt ease thy heart") and "Dream Pedlary" ("If there were dreams to sell"), are among the most exquisite of 19th century lyrics.

Kelsall published Beddoes' great work, *Death's Jest Book; or, The Fool's Tragedy*, in 1850. The drama is based on the story that a certain Duke Boleslaus of Münsterberg was stabbed by his court-fool, the "Isbrand" of the play (see C. F. Floegel, *Geschichte der Hofnarren*, Leipzig, 1789, pp. 297 *et seq.*). He followed this in 1851 with *Poems of the late Thomas Lovell Beddoes*, to which a memoir was prefixed. The two volumes were printed together (1851) with the title of *Poems, Posthumous and Collected*. All these volumes are very rare. Kelsall bequeathed the Beddoes mss. to Robert Browning, with a note stating the real history of Beddoes' illness and death, which was kept back out of consideration for his relations. Browning is reported to have said that if he were ever professor of poetry his first lecture would be on Beddoes, "a forgotten Oxford poet." Mr. (now Sir) Edmund Gosse obtained permission to use the documents from Browning and edited a fuller selection of the *Poetical Works* (1890) for the "Temple Library," supplying a full account of his life. He also edited the *Letters of Thomas Lovell Beddoes* (1894), containing a selection from his correspondence, which is full of gaiety and contains much amusing literary criticism. See also the edition of Beddoes by Ramsay Colles in the "Muses' Library" (1906).

BEDE, BEDA or BAEDA (672 or 673-735), English historian and theologian. Of Baeda, commonly called "the Venerable Bede," almost all that we know is contained in the short autobiographical notice which he has appended to his *Ecclesiastical History*: "Thus much concerning the ecclesiastical history of Britain, and especially of the race of the English, I, Baeda, a servant of Christ and priest of the monastery of the blessed apostles St. Peter and St. Paul, which is at Wearmouth and at Jarrow, have with the Lord's help composed, so far as I could gather it, either from ancient documents, or from the tradition of the elders, or from my own knowledge. I was born in the territory of the said monastery, and at the age of seven I was, by the care of my relations, given to the reverend Abbot Benedict (Biscop), and afterwards to Ceolfrid, to be educated. From that time I have spent the whole of my life within that monastery devoting all my pains to the study of the scriptures; and amid the observance of monastic discipline, and the daily charge of singing in the church, it has ever been my delight to learn or teach or write. In my 19th year I was admitted to the diaconate, in my 30th to the priesthood, both by the hands of the most reverend Bishop John (of Hexham), and at the bidding of Abbot Ceolfrid. From the time of my admission to the priesthood to my (present) 59th year, I have endeavoured, for my own use and that of my brethren, to make brief notes upon the Holy Scripture, either out of the works of the venerable fathers, or in conformity with their meaning and interpretation." Then follows a list of his works, so far as, at that date, they had been composed. As the *Ecclesiastical History* was written in 731, we obtain the following dates for the principal events in Bede's uneventful life. birth, 672-673; entrance into the monastery, 679-680; ordained deacon, 691-692; priest, 702-703.

The monastery of Wearmouth was founded by Benedict Biscop in 674, and that of Jarrow in 681-682. Though five or six miles apart, they were intended to form a single monastery under a single abbot, and so Bede speaks of them in the passage given above. It is with Jarrow that Bede is chiefly associated, though no doubt from the close connection of the two localities he would often be at Wearmouth. The preface to the prose life of Cuthbert proves that he had stayed at Lindisfarne prior to 721, while the Epistle to Egbert shows that he had visited him at York in 733. It is in his works that we must chiefly seek to know him. They fall into three main classes: (1) scientific; (2) historical; (3) theological. The first class comprises works on grammar, one on natural phenomena, and two on chronology and the calendar. These last were inspired largely by the Paschal Question, which was the subject of such bitter controversy between the Roman and Celtic Churches in the 7th century. They form a natural transition to the second class. In this the chief place is held by the *Ecclesiastical History of the English Nation*. By this Bede

has justly earned the title of the Father of English History. By this almost exclusively he is known to others than professed students. It is indeed one of the most valuable and one of the most beautiful of historical works. Bede had the artist's instinct for proportion, the artist's sense for the picturesque and the pathetic. His style, too, modelled largely on that of Gregory in the *Dialogues*, is limpid and unaffected. And though it would be wrong to call Bede a critical historian in the modern sense of the words, he showed a very unusual conscientiousness in collecting his information from the best available sources, and in distinguishing between what he believed to be fact, and what he regarded only as rumour or tradition.

Other historical works of Bede are the *History of the Abbots* (of Wearmouth and Jarrow), and the lives of Cuthbert in verse and prose. The *History of the Abbots* and the prose life of Cuthbert were based on earlier works which still survive. In the case of the latter it cannot honestly be said that Bede has improved on his original. In the *History of the Abbots* he was much nearer to the facts, and could make additions out of his own personal knowledge. The Epistle to Egbert, though not historical in form, may be mentioned here, because of the valuable information which it contains as to the state of the Northumbrian Church, on which the disorders and revolutions of the Northumbrian kingdom had told with disastrous effect. It is probably the latest of Bede's extant works, as it was written in Nov. 734, only six months before his death. The third or theological class of writings consists mainly of commentaries, or of works which, if not commentaries in name, are so in fact. They are based largely on the works of the four great Latin Fathers, SS. Augustine, Jerome, Ambrose and Gregory; though Bede's reading is very far from being limited to these. His method is largely allegorical. For the text of Scripture he used both the Latin versions, the Itala and the Vulgate, often comparing them together. But he certainly knew Greek, and possibly some Hebrew. Indeed it may be said that his works, scientific, historical and theological, practically sum up all the learning of western Europe in his time, which he thus made available for his countrymen. And not for them only; for in the school of York, founded by his pupil Archbishop Egbert, was trained Alcuin (Ealhwin), the initiator, under Charles the Great, of the Frankish schools, which did so much for learning on the continent. And though Bede made no pretensions to originality, least of all in his theological works, freely taking what he needed, and (what is very rare in mediaeval writers) acknowledging what he took, "out of the works of the venerable Fathers," still everything he wrote is informed and impressed with his own special character and temper. His earnest yet sober piety, his humility, his gentleness, appear in almost every line. "In history and in science, as well as in theology, he is before all things the Christian thinker and student." (Plummer's *Bede*, i. 2). Yet it should not be forgotten that Bede could hardly have done what he did without the noble library of books collected by Benedict Biscop.

Several quaint and beautiful legends have been handed down as to the origin of the epithet of "venerable" generally attached to his name. Probably it is a mere survival of a title commonly given to priests in his day. It has given rise to a false idea that he lived to a great age; some mediaeval authorities making him 90 when he died. But he was not born before 672 (see above); and though the date of his death has been disputed, the traditional year, 735, is most probably correct. This would make him at most sixty-three. Of his death a most touching and beautiful account has been preserved in a contemporary letter. His last hours were spent, like the rest of his life, in devotion and teaching, his latest work being to dictate, amid ever-increasing bodily weakness, a translation into the vernacular of the Gospel of St. John, a work which unhappily has not survived. It was a fitting close to such a life as his.

BIBLIOGRAPHY.—The above sketch is largely based on the present writer's essay on Bede's life and works, prefixed to his edition of Bede's *Historia Ecclesiastica*, etc. (Clarendon Press, 1896). *Beda der Ehrwürdige und seine Zeit*, by Dr. Karl Werner (Vienna, 1875), is excellent. Gehle, *Disputatio de Bedae vita et scriptis* (Leyden, 1838) is still useful. Dr. William Bright's *Chapters of Early English Church History* (3rd ed. Clarendon Press, 1897) is indispensable. See

also Ker, *Dark Ages*, p. 141 et seq. Of the collected works of Bede the most convenient edition is that by Giles in 12 vols. (1843-44), which includes translations of the *Historical Works*. The Continental folio editions (Basle, 1563; Cologne 1612 and 1688) contain many works which cannot by any possibility be Bede's. The edition of Migne, *Patrologia Latina* (1862 et seq.) is based on a comparison of the Cologne edition with Giles and Smith (*see below*), and is open to the same criticism. On the chronology and genuineness of the works commonly ascribed to Bede, *see* Plummer's ed., i., cxlv-clix.

On the mss., early editions and translations of the *Historia Ecclesiastica*, *see* Plummer *op. cit.*, i., lxxx-cxxxii. The edition of Whelock (Camb. 1643-44) is noteworthy as the first English edition of the Latin text, and as the *editio princeps* of the Anglo-Saxon version ascribed to King Alfred (*see* ALFRED THE GREAT). Smith's edition (Camb. 1722) contained not only these, but also the other historical works of Bede, with notes and appendices. It is a monument of learning and scholarship. The most recent edition is that with notes and introduction by the present writer, referred to above. It includes also the *History of the Abbots* and the Epistle to Egbert. Of books iii. and iv. only, there is a learned edition by Professors Mayor and Lumby of Cambridge (3rd ed. 1881). A cheap and handy edition of the text alone is that by A. Holder (Freiburg im Breisgau, 1882). The best known modern English translation is that by the Rev. L. Gidley (1870). Of the minor historical works a good edition was edited by Rev. J. Stevenson for the Eng. Hist. Soc. in 1841, and a translation by the same hand was included in *Church Historians of England*, vol. i., part ii. (1853). *See also* Plummer's edition, p. cxxii.-cxlii. (C. PL.)

BEDE, CUTHBERT, the pen-name of Edward Bradley (1827-1889), English author, who was born at Kidderminster on March 25, 1827. He entered University college, Durham, in 1845, and at Oxford took holy orders, and eventually became rector of Stretton in Rutlandshire. Here he gained a reputation as a humorist and numbered among his friends Cruikshank, Frank Smedley, Mark Lemon and Albert Smith. He is chiefly known as the author of *The Adventures of Mr Verdant Green, an Oxford Freshman* (1853), which he illustrated himself and of which a third part appeared in 1856. In 1883 he was given the living of Lavington, Lincolnshire, where he died on Dec. 12, 1889.

BEDELL, WILLIAM (1571-1642), Anglican divine, was a fellow of Emmanuel college, Cambridge, and spent four years at Venice as chaplain to Sir H. Wotton, the English ambassador. After holding various preferments he became in 1629 bishop of Kilmore and Ardagh, where he encouraged the use of the Irish language and won the respect of the people. He resigned in 1633. But in 1641 when Protestants were being massacred Bedell's house was respected, and many Protestants found refuge there. At last the surrender of the fugitives was demanded—and refused. Bedell was imprisoned, and died from the effects of exposure on Feb. 7, 1642.

His *Life* was written by Bishop Burnet (1685), and by his son (ed. T. W. Jones, Camden Soc. 1872).

BEDFORD, EARLS AND DUKES OF. The present English title of duke of Bedford comes from a line of earls and dukes in the Russell family. In Jan. 1550 John, Baron Russell, was created earl of Bedford, and in May 1604 his descendant, William, the 5th earl, became duke of Bedford. The title of duke of Bedford had, however, been previously held, notably by the third son of Henry IV.; and the earlier creations will first be considered here.

JOHN PLANTAGENET (1389-1435), duke of Bedford, third son of Henry IV., king of England, was born on June 20, 1389, and created duke of Bedford by his brother, Henry V., in 1413. He acted as lieutenant of the kingdom during Henry's expedition to France in 1415, and in Aug. 1416 commanded the ships which defeated the French fleet at the mouth of the Seine, and was instrumental in relieving Harfleur. Again appointed lieutenant in July 1417, he marched against the Scots, who abandoned the siege of Berwick at his approach; and on his return to London he brought Sir John Oldcastle to trial and was present at his execution. In Dec. 1419, he resigned his office as lieutenant, and joined the king in France. Returning to England, he undertook the lieutenancy for the third time in June 1421, and in the following May conducted the queen to join Henry in Normandy. He then took his brother's place and led the English troops to the relief of Cosne, but on hearing of the king's serious illness, he left the army and hurried to his side. Henry's last wish was that Bedford should be guardian of the kingdom and of the young king, and that Philip the Good, duke of Burgundy, should act as regent in France. But

when Philip declined to undertake this office, it, too, was assumed by Bedford, who, after the death of the French king, Charles VI., in Oct. 1422, presided at a session of the parlement of Paris, and compelled all present to take an oath of fidelity to King Henry VI. Meanwhile the English Parliament had decided that Bedford should be "protector and defender" of the kingdom, and that in his absence the office should devolve upon his brother Humphrey, duke of Gloucester. Confining himself to the conduct of affairs in France the protector took up Henry V.'s work of conquest, captured Meulan and other places, and sought to strengthen his position by an alliance with Philip of Burgundy. This task was rendered more difficult as Gloucester had just married Jacqueline, countess of Holland and Hainaut, a union which gave the English duke a claim on lands which Philip hoped to secure for himself. Bedford, however, having allayed Philip's irritation, formed an alliance with him and with John VI., duke of Brittany, at Amiens in April 1423, and himself arranged to marry Anne, a sister of the Burgundian duke. This marriage was celebrated at Troyes in the following June, and the war against Charles, the dauphin of France, was prosecuted with vigour and success. Bedford sought to restore prosperity to the districts under his rule by reforming the debased coinage, granting privileges to merchants and manufacturers, and removing various abuses. He then granted some counties to Philip to check the growing hostility between him and Gloucester, and on Aug. 17, 1424, gained a great victory over a combined army of French and Scots at Verneuil. But in spite of the efforts of the protector the good understanding between England and Burgundy was partially destroyed when Gloucester invaded Hainaut in Oct. 1424.

The ambition of his brother gave Bedford trouble in another direction also; for on his return from Hainaut, Gloucester quarrelled with the chancellor, Henry Beaufort, bishop of Winchester, and the council implored Bedford to come to England to settle this dispute. He reached London in Jan. 1426 and after concluding a bond of alliance with Gloucester effected a reconciliation between the duke and the chancellor; and knighted the young king, Henry VI. Bedford then promised to act in accordance with the will of the council, and in harmony with the decision of this body, raised a body of troops and returned to France in March 1427. Having ordered Gloucester to desist from a further attack on Hainaut, he threatened Brittany and compelled Duke John to return to the English alliance; and the success of his troops continued until the siege of Orleans, to which he consented with reluctance, was undertaken in Oct. 1428. Having assured himself that Philip was prepared to desert him, Bedford sent orders to his army to raise the siege in April 1429. He then acted with great energy and judgment in attempting to stem the tide of disasters which followed this failure, strengthened his hold upon Paris, and sent to England for reinforcements; but before any engagement took place he visited Rouen, where he sought to bind the Normans closer to England, and after his return to Paris resigned the French regency to Philip of Burgundy in accordance with the wish of the Parisians. Retaining the government of Normandy, Bedford established himself at Rouen and directed the movements of the English forces with some success. He did not interfere to save the life of Joan of Arc. He was joined by Henry VI. in April 1430, when the regency was temporarily suspended, and he secured Henry's coronation at Paris in Dec. 1431. In Nov. 1432 his wife Anne died, and in April 1433 he was married at Théroutanne to Jacqueline, daughter of Pierre I., count of St. Pol.

But notwithstanding Bedford's vigour the English lost ground steadily; and the death of Anne and this marriage destroyed the friendly relations between England and Burgundy. Negotiations for peace had no result, and when the duke returned to England in June 1433 he told Parliament that he had come home to defend himself against the charge that the losses in France were caused by his neglect, and demanded that his detractors should make their accusations public. The chancellor replied that no such charges were known to the king or the council, and the duke was thanked for his great services. As chief councillor he offered to take a smaller salary than had been previously paid to Gloucester, and undertook this office in Dec. 1433, when his demands with

regard to a continual council were conceded Bedford, who was anxious to prosecute the war in France, left England again in 1434, but early in 1435 was obliged to consent to the attendance of English representatives at a congress held to arrange terms of peace at Arras. Unable to consent to the French terms, the English envoys left Arras in September, and Philip of Burgundy made a separate treaty with France. Bedford only lived to see the ruin of the cause for which he struggled so loyally. He died at Rouen on Sept. 14, 1435, and was buried in the cathedral of that city. He left a natural son, Richard, but no legitimate issue. Bedford was a man of considerable administrative ability, brave and humane in war, wise and unselfish in peace. He was not responsible for the misfortunes of the English in France, and his courage in the face of failure was as admirable as his continued endeavour to make the people under his rule contented and prosperous.

The chief contemporary authorities for Bedford's life are: *Vita et gesta Henrici Quinti*, ed. T. Hearne (1727); E. de Monstrelet, *Chronique*, ed. L. D. d'Arcq (1857-62); William of Worcester, *Annales rerum Anglicarum*, ed. J. Stevenson (1864). See also P. A. Barante, *Histoire des ducs de Bourgogne* (1824); *Proceedings and Ordinances of the Privy Council of England*, ed. J. R. Dasent (1890-99); W. Stubbs, *Constitutional History*, vol. iii. (1895).

In 1470 GEORGE NEVILL (c. 1457-1483), son of John, earl of Northumberland, was created duke of Bedford; but after his father's attainder and death at the battle of Barnet in 1471 he was degraded from the peerage.

The next duke of Bedford was JASPER TUDOR (c. 1430-1495), half-brother of King Henry VI. and uncle of Henry VII. He was made earl of Pembroke in 1453. Having survived the vicissitudes of the Wars of the Roses he was restored to his earldom and created duke of Bedford in 1485. The duke, who was lord-lieutenant of Ireland from 1486 to 1494, died without legitimate issue on Dec. 21, 1495.

JOHN RUSSELL, 1st earl of Bedford (c. 1486-1555), was a son of James Russell (d. 1509). In 1513 he took part in the war with France. He was with Henry at the Field of the Cloth of Gold in 1520, and, returning to military service, when the French war was renewed, lost his right eye at the siege of Morlaix in 1522. In 1523 he went secretly to France, where he negotiated a treaty between Henry and Charles, duke of Bourbon, who was anxious to betray the French king, Francis I. After a short visit to England, Russell was sent with money to Bourbon, joining the constable at the siege of Marseille. In 1524 he visited Pope Clement VII. at Rome, and, having eluded the French, who endeavoured to capture him, was present at the battle of Pavia in Feb. 1525, returning to England about the close of the year. In Jan. 1527 he was sent as ambassador to Clement, who employed him to treat on his behalf with Charles de Lannoy, the general of Charles V. The next few years of Russell's life were mainly spent in England. He entered Parliament for Buckingham in 1520, and although an opponent of the party of Anne Boleyn, retained the favour of Henry VIII. He took an active part in suppressing the Pilgrimage of Grace in 1536, and was one of the commissioners appointed to try the Lincolnshire prisoners. He now received many high honours and offices. In 1530, when Charles V. and Francis I. were threatening to invade England, he was sent into the west, and crossed to France when Henry attacked Francis in 1544. He was in command of an army in the west of England in 1545, and when Henry died in Jan. 1547 was one of the executors of his will. Under Edward VI. Russell was lord high steward and keeper of the privy seal, and the defeat which he inflicted on the rebels at Clyst St. Mary, near Exeter, in Aug. 1549, was largely instrumental in suppressing the rising in Devonshire. In Jan. 1550 he was created earl of Bedford, and was one of the commissioners appointed to make peace with France in this year. He opposed the proposal to seat Lady Jane Grey on the throne; supported Queen Mary, who reappointed him lord privy seal; and assisted to prevent Sir Thomas Wyatt's rising from spreading to Devonshire. In 1554 he went to Spain to conclude the marriage treaty between Mary and Philip II., and, soon after his return, died in London on March 14, 1555. By extensive acquisitions of land, Bedford was the founder of the wealth and greatness of the house of Russell. Among the many properties which fell into his hands was Covent Garden, and seven acres of

land in London formerly the property of the protector Somerset. He left an only son, Francis, who succeeded him in the title.

See *State Papers during the Reign of Henry VIII.* (1832-52); J. H. Wiffen, *Historical Memoirs of the House of Russell* (1833); *Calendar of State Papers, Edward VI. and Mary* (1861); *Letters and Papers of Henry VIII.* (1862-1901); J. A. Froude, *History of England*, *passim* (1881 fol.).

FRANCIS RUSSELL, 2nd earl of Bedford (c. 1527-1585), was educated at King's Hall, Cambridge. He took his seat in the House of Lords as Lord Russell in 1552. Russell was in sympathy with the reformers, whose opinions he shared, and was in communication with Sir Thomas Wyatt; and was imprisoned during the earlier part of Mary's reign. He then visited Italy; came into touch with foreign reformers; and fought at the battle of St. Quentin in 1557. When Elizabeth ascended the throne, in Nov. 1558, the earl of Bedford, as Russell had been since 1555, became an active figure in public life. He was made a privy councillor, and was sent on diplomatic errands to Charles IX. of France and Mary queen of Scots. From Feb. 1564 to Oct. 1567 he was governor of Berwick and warden of the east marches of Scotland, in which capacity he conducted various negotiations between Elizabeth and Mary. When the northern insurrection broke out in 1569, Bedford was sent into Wales, and he sat in judgment upon the duke of Norfolk in 1572. In 1576 he was president of the Council of Wales, and in 1581 was one of the commissioners deputed to arrange a marriage between Elizabeth and Francis, duke of Anjou. Bedford died in London on July 28, 1585.

FRANCIS RUSSELL, 4th earl of Bedford (1593-1641), was the only son of William, Lord Russell of Thornhaugh, to which barony he succeeded in Aug. 1613. In May 1627 he became earl of Bedford by the death of his cousin, Edward, the 3rd earl. When the quarrel broke out between Charles I. and the Parliament, Bedford supported the demands of the House of Commons as embodied in the Petition of Right, and in 1629 was arrested for his share in the circulation of Sir Robert Dudley's pamphlet, "Proposition for His Majesty's service," but was quickly released. The Short Parliament meeting in April 1640 found the earl as one of the king's leading opponents. He was greatly trusted by John Pym and Oliver St. John, and is mentioned by Clarendon as among the "great contrivers and designers" in the House of Lords. In July 1640 he was among the peers who wrote to the Scottish leaders refusing to invite a Scottish army into England, but promising to stand by the Scots in all legal and honourable ways; and his signature was afterwards forged by Thomas, Viscount Savile, in order to encourage the Scots to invade England. In the following September he was among those peers who urged Charles to call a parliament, to make peace with the Scots, and to dismiss his obnoxious ministers; and was one of the English commissioners appointed to conclude the Treaty of Ripon. When the Long Parliament met in Nov. 1640, Bedford was generally regarded as the leader of the Parliamentarians. Bedford was essentially a moderate man. He did not wish to alter the government of the Church, was on good terms with Archbishop Laud, and, although convinced of Strafford's guilt, was anxious to save his life. In the midst of the parliamentary struggle Bedford died of small-pox on May 9, 1641. Bedford was the head of those who undertook to drain the great level of the fens, called after him the "Bedford Level." He spent a large sum of money over this work and received 43,000 acres of land, but, owing to various jealousies and difficulties, the king took the work into his own hands in 1638, making a further grant of land to the earl.

See J. H. Wiffen, *Historical Memoirs of the House of Russell* (1833); J. L. Sanford, *Studies and Illustrations of the Great Rebellion* (1858); Clarendon, *History of the Rebellion*, *passim* (1888).

JOHN RUSSELL, 4th duke of Bedford (1710-1771), second son of Wriothsley Russell, 2nd duke of Bedford, by his wife, Elizabeth, daughter and heiress of John Howland, of Streatham, Surrey, was born on Sept. 30, 1710, and succeeded his brother Wriothsley (1708-32), 3rd duke of Bedford. The new duke joined the opposition to Sir Robert Walpole, and in Nov. 1744 became first lord of the admiralty in the administration of Henry Pelham. He was subsequently lord-lieutenant of Ireland 1756-57, and lord privy seal in the Bute cabinet of 1761. In 1762 he was sent to France to

treat for peace, and signed the Peace of Paris in 1763. He was lord president of the council in the Grenville cabinet in the same year. When the ministry fell in July 1765, the duke of Bedford became the leader of a political party known as the "Bedford party," or the "Bloomsbury gang." He himself did not return to office, but his friends joined the Crafton ministry in Dec. 1767, a proceeding which provoked "Junius" to write his "Letter to the duke of Bedford." The duke died at Woburn on Jan. 15, 1771.

See J. H. Wiffen, *Historical Memoirs of the House of Russell* (1833); *Correspondence of John, 4th Duke of Bedford*, ed. Lord John Russell (1842-46); Horace Walpole, *Memoirs of the Reign of George II.* (1847); W. E. H. Lecky, *History of England*, vol. iii. (1892); and *Memoirs of the Reign of George III.*, ed. G. F. R. Barker (1894).

FRANCIS RUSSELL, 5th duke of Bedford (1765-1802), eldest son of Francis Russell, marquess of Tavistock (d. 1767), by his wife, Elizabeth (d. 1768), daughter of William Keppel, 2nd earl of Albemarle, was baptized on July 23, 1765. In Jan. 1771 he succeeded his grandfather as duke of Bedford, and was educated at Westminster school and Trinity college, Cambridge, afterwards spending nearly two years in foreign travel. Regarding Charles James Fox as his political leader, he joined the Whigs in the House of Lords, and became a member of the circle of the prince of Wales, afterwards George IV. Bedford was greatly interested in agriculture. He established a model farm at Woburn, and made experiments with regard to the breeding of sheep. He was a member of the original board of agriculture, and was the first president of the Smithfield club. He died at Woburn on March 2, 1802, and was buried in the family burying-place at Chenies. The duke was never married, and was succeeded in the title by his brother John.

See J. H. Wiffen, *Historical Memoirs of the House of Russell* (1833); E. Burke, *Letter to a Noble Lord* (1837); Lord Holland, *Memoirs of the Whig Party* (1854); and Earl Stanhope, *Life of Pitt* (1861-62).

JOHN RUSSELL, 6th duke of Bedford (1766-1839), was succeeded as seventh duke by his eldest son, Francis (1788-1861), who had an only son, William (1809-72), who became duke on his father's death in 1861. When the eighth duke died in 1872, he was succeeded by his cousin, Francis Charles Hastings (1810-91), who was member of parliament for Bedfordshire from 1847 until he succeeded to the title. The ninth duke was the eldest son of Maj.-Gen. Lord George William Russell (1790-1846), who was a son of the sixth duke. He married Elizabeth, daughter of George John, 5th earl de la Warr, and both his sons, George William Francis Sackville (1852-93), and Herbrand Arthur (b. 1858), succeeded in turn to the title.

BEDFORD, municipal borough, and county town of Bedfordshire, England, 50m N.N.W. of London by the L.M.S. railway. Pop. (1921) 40,242. It lies in the fertile valley of the Ouse, mainly north of the river, where stands the mound which marks the site of the ancient castle. Near the site was a small Roman station controlling the ford; while the rich cemetery of Kempston indicates early Saxon occupation. Bedford (Bedcanforda, Bedanforda, Bedeford) is first mentioned in 571, when Cuthwulf defeated the Britons here. It subsequently became a Danish borough and was captured by Edward the Elder in 914. Owing to its central position and fordable river site it became the capital of the nascent shire to which it gave its name (see BEDFORDSHIRE). In Domesday, as the county town, it was entered apart from the rest of the shire, and was assessed for ship service. The prescriptive borough received its first charter from Henry II. The privileges included a gild-merchant, all tolls, and liberties and laws in common with the citizens of Oxford. This charter was confirmed by successive sovereigns down to Charles II. The castle, first mentioned in 1136, was destroyed in 1224. During the 15th century, owing to the rise of other market towns, Bedford became less prosperous. Henry VIII granted a November fair to St. Leonard's hospital, which was still held in the 19th century at St. Leonard's farm, the site of the hospital. Mary granted fairs in Lent and on the Feast of the Conception, and also a weekly market. In the 17th century Bedford carried on trade in coal, brought by the Ouse from Lynn and Yarmouth. The town was also one of

the earliest centres of the lace trade, to the success of which French refugees in the 17th and 18th centuries largely contributed.

Bedford was represented in the parliament of 1295, and after that date two members were returned regularly until 1885.

The church of St. Paul, mainly Decorated and Perpendicular, contains the tomb of Sir William Harper or Harpur (c. 1406-1573), lord mayor of London, a notable benefactor of his native town of Bedford. Portions of the tower of St. Peter's church are probably of pre-Conquest date; St. Mary's is in part Norman, and St. John's Decorated; but the bodies of these churches are largely restored. There are some remains of a Franciscan friary of the 14th century. The Congregational chapel called Bunyan's or the "Old Meeting" stands on the site of the building in which John Bunyan preached from 1656 onward. In the town he underwent a long but in part nominal imprisonment. In the panels of a fine pair of bronze doors in the chapel are scenes illustrative of Bunyan's *Pilgrim's Progress*. Bedford is noted for its grammar school, founded by Edward VI. in 1552, and endowed by Sir William Harper. The existing buildings, however, date from 1801 and later. The Harper Trust also supports other educational establishments. There are statues of John Bunyan (1874) and John Howard (1894) the philanthropist. There are two parks. Bedford has a large trade as a market town for agricultural produce, and extensive engineering works and manufactures of agricultural implements. The municipal borough is under a mayor, six aldermen and 18 councillors. Area 2,223 acres. Bedford remained a parliamentary borough until 1918 and now forms, with Kempston and some rural areas, the Bedford parliamentary division.

BEDFORD, a city of Indiana, U.S.A., 70m south by west of Indianapolis, in the heart of the Indiana limestone district; the county seat of Lawrence county. It is on Federal highway 50, and is served by the Monon route and the Chicago, Indianapolis and Louisville railways. The population in 1920 was 9,076 and was estimated locally at 20,000 in 1928. "Bedford limestone" is one of the most highly prized building materials in the country. It is shipped to all parts of the United States and Canada and to some European countries, and has been used for public buildings in many cities. Bedford was settled in 1825, and incorporated as a city in 1889.

BEDFORD, a borough and the county seat of Bedford county, Pennsylvania, U.S.A., on the Raystown branch of the Juniata river, 38m S. by W. of Altoona. It is on the Lincoln highway and the Pennsylvania railroad. The population in 1920 was 2,330. It lies in a beautiful valley, at an altitude of 1,060ft., and within a few miles are numerous mineral springs. Bedford Springs, 11m S., is a fashionable summer resort. Bedford has bottling works, and manufactures peanut products, garments, handles, telephone and telegraph pins, cabinets and other wooden products.

A settlement was made here about 1750 by an Indian trader named Ray, and the place was originally known as Raystown. Ft. Bedford, an important frontier post for many years, was built in July, 1751. The town was laid out in 1766 and incorporated in 1795. Washington came here in 1794 to review the army sent to quell the Whiskey Insurrection. Some interesting 18th century houses are still standing.

BEDFORD, a town of Virginia, 25m. S.W. of Lynchburg, on the Norfolk and Western Railroad, the county seat of Bedford county. The population in 1920 was 3,243. It lies nearly 1,000ft. above sea-level, and the view to the N. and W. is bounded by the Blue Ridge; it is the railway station for the Peaks of Otter. Hydro-electric power is supplied from a municipal plant on the James river, built in 1911. The principal manufactures are tin cans (125,000,000 annually), woollens, automobile tyres and tubes, packers' labels, paint pigments, and locust pins used on telephone poles and in ship-building. Bedford is an important tobacco market. Tomatoes and other vegetables are canned in large quantities in the adjacent country. The national home of the Order of Elks, and one of the schools of the Randolph-Macon system (see ASHLAND, Va.) are located here. The town was established and made the county seat by an Act of the State legislature in 1782.

BEDFORDSHIRE (abbreviated *Beds*), a south midland county of England, bounded north-east by Huntingdonshire, east by Cambridgeshire, south-east by Hertfordshire, west by Buckinghamshire, and north-west by Northamptonshire. It is among the smaller English counties, having an area of 466.4 sq. m. It lies principally in the middle part of the Ouse basin, which, entering in the north-west traverses the rich vale of Bedford in a very winding course to reach the north-east of the county near St. Neots. A small part of the main Chiltern chain is included in the south, but most of the county is lowland and forms part of the Wash drainage system. In the south the headwaters of the Lea (Thames basin) fall within the county, and in the north a few tributaries of the Nen.

Geological Formations.—The main features are controlled by geological formations dipping to the south-east and outcropping in a general south-west to north-east direction. The Middle Oolites predominate in the north of the county, the Oxford Clay occupying the low country around Bedford. The Great Oolite is exposed by the Great Ouse above the town, with alternating limestones and clays, seen in quarries. The Cornbrash is represented by 2 ft. of limestone, but the Kellaways Rock, with its masses ("doggers") of cemented sand, is well exposed near Bedford. Next the Lower Greensand forms an elevated tract running from Potton through Ampthill to Woburn and Leighton Buzzard, where the sand is dug for various purposes. Above this comes the Gault Clay, occupying the broad vale of the Ivel and extending to the chalk. This rises abruptly from the lowland, to bare heights over 600 ft., high in the Dunhill Moors and the Chiltern Hills above Dunstable. At the base of the chalk is the Chalk Marl; above this is the hard Totternhoe Stone, a well-marked feature. The Lower Chalk next above is capped similarly by hard chalk as at Royston and elsewhere. The upper Chalk-with-Flints occurs near the south-eastern boundary. Patches of glacial boulder clay and gravel overlies the rocks. Fossil, rhinoceros, mammoth, etc., with palaeolithic implements, have been found in most parts in the valley gravels of the Ouse Basin. Occupation of the area during later prehistoric periods was slight. The small area of chalkland within the county is sufficient explanation for this. On the chalk hills are a number of earthworks probably dating for the most part from the Early Iron Age. The Late Celtic settlements, judging from the remains, extended over a restricted area which coincided with the Lower Greensand and Gault from Leighton Buzzard to Potton, good corn-growing country. Roman settlements, too, were thickest here. At Dunstable (*Durocobrivae*) was a posting-station on Watling Street, at the crossing of the Icknield Street. Another road ran approximately north through Stotford, Biggleswade, and Sandy to Godmanchester. Bedford and Shelford were stations at fords across the Ouse and Ivel respectively.

Origin of County.—In contradistinction to the southern shires in general (see *BERKSHIRE*) Bedfordshire is not a prehistoric unit, for early man avoided the swampy and forested lowlands. In Saxon times, however, the valleyward movement of population advanced far, and with better means of cultivation and forest-clearing the rich agricultural valleys were centres of attraction. The river and valley routes, moreover, guided penetration and influenced settlement. Most of the midland counties date from the conquest of Mercia from the Danes in the 9th and 10th centuries. This reconquest proceeded by the valleys, and thus Bedfordshire took shape after the struggles of King Edward (919-921). The first mention of the county named from the town comes in 1016, when King Canute laid waste the whole shire. The Domesday survey reveals an almost complete substitution of Norman for English holders. In the Civil War of Stephen's reign the county suffered severely. Again the county was thrown into the Barons' War, when Bedford Castle was the scene of three sieges before it was demolished by the king's orders in 1224. The Peasants' Revolt (1377-81) affected some settlements, e.g., Dunstable, to a slight degree.

In the Civil War of the 17th century the county was one of the foremost in opposing the king. Clarendon observes that Charles had no visible party or fixed quarter in the county. Bedfordshire

had received considerable numbers of Protestant refugees from the Continent and was becoming one of the historic centres of dissent. In this connection one should note that Elstow is famous as the home of John Bunyan.

The county produced no great religious houses like those of Hertfordshire or Northamptonshire. The Augustinian Dunstable Priory remains only as a fragment of the parish church. Judith, niece of William the Conqueror, established the Benedictine nunnery of Elstow, of which the imperfect church remains. There are portions also of the Gilbertine Chicksands Priory and of a Cistercian foundation at Old Warden. There is some Norman or pre-Norman work (as at Clapham) surviving in some churches, but the predominant styles are Decorated and Perpendicular.

Industries and Communications.—Bedfordshire has always been a prominent agricultural rather than manufacturing county. From the 13th to the 15th century sheep farming flourished, Bedfordshire wool being in request and plentiful. Tradition says that the straw-plait industry owes its introduction to James I., who transferred to Luton the colony of Lorraine plaiters whom Mary Queen of Scots had settled in Scotland. Similarly the lace industry is associated with Catherine of Aragon. As late as the 19th century the lace makers kept "Cattern's Day" as the holiday of their craft. The Flemings, expelled by Alva's persecution (1569), brought the manufacture of Flemish lace to Cranfield, whence it spread to surrounding districts. The revocation of the Edict of Nantes, and consequent French migration, gave further impetus to the industry.

The main L.N.E.R. line traverses the east of the county, through Biggleswade. The London to Bedford line is under control of the L.M.S.; and the Bletchley and Cambridge line (L.M.S.R.) crosses these lines at Sandy and Bedford respectively. The London and Bletchley (L.M.S.R.) line serves Leighton Buzzard in the south-west and branches thence to Dunstable and Luton. A branch of the L.M.S.R. connects Bedford with the L.N.E.R. at Hitchin.

It is known that in 1926 about 83% of the total area of 301,829 acres (excluding water surfaces) was under crops or grasses. In addition there were 4,339 acres of rough grazing. The chief crop is wheat, for which the soil in the vale of Bedford is specially suited; while on the sandy loam of the Ivel valley, in the neighbourhood of Biggleswade, market-gardening is extensively carried on, the crops going, with much dairy produce, principally to London. The manufacture of agricultural machinery and implements employs a large number of hands at Bedford and Luton. Luton, however, is specially noted for the manufacture of straw hats. Straw-plaiting was once extensively carried on in this neighbourhood by women and girls in their cottage homes. Another local industry surviving is the manufacture of pillow-lace. Many of the lace designs are French; Mechlin and Maltese patterns are also copied.

Administration.—Bedfordshire is divided into nine hundreds, Barford, Biggleswade, Clifton, Flitt, Manshead, Redbornestoke, Stodden, Willey, and Wiscamtree, and the liberty, half hundred, or borough of Bedford. In the 11th century there were three additional half hundreds, viz., Stanburge, Buchelai, and Weneslai, which had by the 14th century become parts of the hundreds of Manshead, Willey, and Biggleswade respectively. Until 1574 one sheriff did duty for Bedfordshire and Buckinghamshire, the shire court of the former being held at Bedford. The county is in the midland circuit and assizes are held at Bedford. It has one court of quarter-sessions and eight petty sessional divisions. The boroughs of Bedford, Dunstable, and Luton have separate commissions of the peace, and Bedford a separate court of quarter-sessions. There are 133 civil parishes. Bedfordshire forms an archdeaconry in the diocese of Ely, having been transferred from the Lincoln diocese in 1837. There are 125 ecclesiastical parishes and parts of six others.

The area of the administrative county is 302,042 acres, with a population of 206,463 in 1921. The municipal boroughs, with populations (1921) are: Bedford (40,242), Dunstable (8,889), and Luton (57,075); the urban districts Ampthill (2,270), Biggleswade (5,395), Kempston, adjoining Bedford on the south-west

(5,218), and Leighton Buzzard (6,797). Other towns are Pottton (2,087), Shefford (849), and Woburn (1,062).

There are three parliamentary divisions, the Bedford, Luton, and Mid Division. Bedford (q.v.) was a parliamentary borough until 1918.

(1884); and *Illustrated Bedfordshire* (Nottingham, 1895). See also *Bedfordshire Notes and Queries*, ed. F. A. Blades; *Transactions of the Bedfordshire Natural History and Field Club*, and *Victoria County History* (1904).

BÉDIER, JOSEPH (1864–), French scholar, was born Jan. 28 1864, in Paris and was appointed professor of mediaeval French language and literature at the Collège de France in 1893. He won the degree of *docteur-ès-lettres* with *Les Fabliaux*, a work on early French poetry which was crowned by the Académie Française. The publication of his *Roman de Tristan et Iseult* (1900) set a European seal on his reputation. In *Les Légendes épiques* (1908) he developed, with a wealth of picturesque detail, his theory that the great cycles of romance grew up along the pilgrim routes of mediaeval France. He thus supplied an ingenious and romantic interpretation of the Charlemagne, Guillaume, and Quatre Fils Aymon cycles, which directly contradicted the theory of their origin from a primitive common epic material maintained by Gaston Paris and his successors. Bédier's exquisite and lucid style gained him innumerable admirers among scholars and laymen alike.

BEDLAM, the popular name of Bethlehem hospital, the first English lunatic asylum. It was originally founded by Simon FitzMary, sheriff of London, in 1247, as a priory for the sisters and brethren of the order of the Star of Bethlehem. It had as one of its special objects the housing and entertainment of the bishop and canons of St Mary of Bethlehem, the mother-church, on their visits to England. Its first site was in Bishopsgate street. It is not certain when lunatics were first received in Bedlam, but it is mentioned as a hospital in 1330 and some were there in 1403. In 1547 it was handed over by Henry VIII. with all its revenues to the City of London as a hospital for lunatics. With the exception of one such asylum in Granada, Spain, the Bethlehem hospital was the first in Europe. It became famous and afterwards infamous for the brutal ill-treatment meted out to the insane. In 1675 it was removed to new buildings in Moorfields and finally to its present site in St. George's road, in south-east London. The word "Bedlam" has long been used generically for all lunatic asylums.

BEDLINGTON, urban district, Northumberland, England, 5m. S.E. of Morpeth, on a branch of the LNER Pop (1921) 26,408. It lies on high ground above the river Blyth, 2½m above its mouth. Bedlington (Betlington) and the hamlets belonging to it were bought by Cutheard, bishop of Durham, between 900 and 915 and, although in Northumberland, became part of the county palatine of Durham over which Bishop Walcher was granted royal rights by William the Conqueror. Bedlington lost these special privileges in 1536 although it remained in the hands of the bishops of Durham until taken over by the Ecclesiastical Commissioners in 1866. Bedlingtonshire was made part of Northumberland for civil purposes by acts of Parliament in 1832 and 1844.

The church of St. Cuthbert shows good transitional Norman details. Its dedication recalls the resting place of the body of Cuthbert of Lindisfarne, removed from Durham after the Norman Conquest.

The modern growth depends almost entirely on the development of the rich coalfield. There are also iron foundries; and smiths, ironworkers and coal-miners compose the population.

BEDLOE, WILLIAM (1650–1680), English informer, was born in Chepstow on April 20, 1650. He appears to have been well educated; he was certainly clever, and after coming to London in 1670 he became acquainted with some Jesuits and was occasionally employed by them. Calling himself now Capt Williams, now Lord Gerard or Lord Newport or Lord Cornwallis, he travelled from one part of Europe to another; he underwent imprison-

ments for crime, and became an expert in all kinds of duplicity. Then, in 1678, following the lead of Titus Oates, he gave an account of a supposed popish plot to overthrow the English Government, and his version of the details of the murder of Sir E. B. Godfrey was rewarded with £500. Emboldened by his success he denounced various Roman Catholics, and having become very popular lived in luxurious fashion. Afterwards his fortunes waned, and he died at Bristol on Aug. 20, 1680. Bedloe wrote a *Narrative and impartial discovery of the horrid Popish Plot* (1679), but all his statements are extremely untrustworthy.

See J. Pollock, *The Popish Plot* (1903); A. A. Marks, *Who killed Sir Edmond Berry Godfrey?* (1905); Sir John Richard Hall, *Four Famous Mysteries* (1922); R. W. Postgate, *Murder, Piracy and Treason* (1926).

BEDMAR, ALPHONSO DELLA CUEVA, MARQUIS OF (1572–1655), Spanish diplomatist, became ambassador to the republic of Venice in 1607. When Bedmar took up this appointment, Venice had just concluded an alliance with France, Switzerland and the Netherlands, to counterbalance the power of Spain. Assisted by the duke of Ossuna, viceroy of Naples, Bedmar formed a plan to bring the city into the power of Spain. The plot, fixed for Ascension Day, 1618, was discovered and Bedmar left Venice. It has sometimes been suggested that the details of the plot existed only in the minds of the Venetian senators, and that its disclosure was a ruse to get rid of Bedmar, who was certainly intriguing against Venice. In 1622 Bedmar was made a cardinal, and soon afterwards became bishop of Oviedo, a position which he retained until his death, which occurred at Oviedo on Aug. 2, 1655. The authorship of an anonymous work, *Squitinio della libertà Veneta*, published at Mirandola in 1612, has been attributed to him.

See C. V. de Saint-Réal, *Oeuvres*, tome iv. (1745); P. J. Grosley, *Discussion historique et critique sur la conjuration de Venise* (1756); P. A. N. B. Daru, *Histoire de la république de Venise* (1853); A. Baschet, *Histoire de la chancellerie secrète à Venise* (1870).

FROM BUNLMANN, "CLASSIC AND RENAISSANCE ARCHITECTURE"

BED-MOULD, in architecture, the moulding, or combination of mouldings projecting from the wall or frieze directly under the jutting portion of a cornice, as a means of support; the lowest member of a classical cornice. See ORDER.

BEDOUIN: see ARABS.

BEDOUL. In the mountains of the Sinai peninsula, inhabiting the tombs, are the Bedouls, the "changed ones," who are said to have been Jews and to have abandoned their faith some centuries ago.

BED-SORE, a form of ulceration or sloughing occurring in persons who, through sickness or old age, are confined to bed, and resulting from pressure or irritation by faeces or urine. Bed-sores denote a low nutritive condition of the tissues. They may occur wherever there is pressure, and lack of cleanliness is an important factor in their production. Nevertheless, where the lower reflex arc is broken by lesion of the spinal cord or of posterior nerves or nerve-roots bed-sores of unusual severity and rapid onset are almost inevitable. All parts subjected to pressure or friction must be frequently washed with soap and warm water, and dried with a warm, soft towel. The part should then be bathed in a solution of corrosive sublimate in spirits of wine and, finally, dusted with an oxide of zinc and starch powder. Pressure may be relieved over bony prominences by a water or air pillow. Where bed-sore threatens, the skin becomes dead white or dusky red and the redness does not disappear on pressure. The surrounding tissues become oedematous and pain is often severe, except in paralysis. As the condition progresses, pain ceases, the epidermis becomes raised as in a blister, and finally becomes detached. Even now actual ulceration can be prevented if proper care be taken; but failing this, the skin sloughs and an ulcer forms. In treating this, the position of the patient must be such that no pressure is allowed on the sloughing tissue, and the parts should be dusted with animal charcoal and iodoform and protected with a dry dressing.

When the slough has separated and the sore is clean, friar's balsam may hasten healing.

BEDSTRAW, a genus of plants (*Galium*) of the family Rubiaceae with about 300 species, found chiefly in temperate parts of the northern hemisphere, many of them being common weeds. The flowers are minute, but are often aggregated into large panicles (see **FLOWER**). Common British species are the yellow bedstraw (*G. verum*) and the goosegrass or cleavers (*G. Aparine*), which bears hooks on the stems, leaves and fruits. Both the foregoing are found in Europe and North America. In the United States and Canada there are some 60 species of *Galium*, several of which are introduced weeds. Among the more conspicuous are the sweet-scented bedstraw (*G. triflorum*), which grows throughout that continent and also in Europe and Asia; the northern bedstraw (*G. boreale*), with profuse clusters of white flowers, found across N. America and also in the British Isles and across northern Europe and Asia; the great bedstraw (*G. Mollugo*), called also wild madder and baby's-breath, an Old World plant, naturalized from Newfoundland to Ohio; the wild licorice (*G. circaezans*), found in dry woods from Quebec to Minnesota and southward; and the California bedstraw (*G. californicum*), a yellow-flowered species, native to the Coast ranges. Some species, including *G. verum*, *G. trifidum* and *G. boreale*, yield dyes.

BEDWORTH, manufacturing town, Warwickshire, England; on the Nuneaton-Coventry branch of the London Midland and Scottish railway, 3½ m. S. of Nuneaton. Population of parish (1921) 11,548. A tramway connects with Coventry, and the Coventry canal passes through. Coal and ironstone are mined; there are iron-works, and bricks, bats, ribbons and tape and silk are made. Similar industries are carried on in the populous district (including the villages of Exhall and Foleshill) which extends southward towards Coventry.

BEE, the name given to a large group of insects forming the superfamily Apoidea of the order HYMENOPTERA (q.v.). Their

feathery. The labium and maxillae are developed in the form of a proboscis for extracting nectar, the principal part concerned being the ligula which is modified to form the so-called tongue. Adaptations for pollen-collecting are found on the hind legs, the tibia and first joint of the tarsus usually being dilated and densely

chief distinguishing features are correlated with their habit of obtaining pollen and nectar from flowers. Most species of bees are hairy and over parts of the body the hairs are branched or

FIG. 2.—LARVA AND PUPA OF THE BEE

covered with pollen-carrying hairs; in some bees the under side of the abdomen is also beset with regularly arranged hairs.

The eggs of bees are laid singly in chambers or cells, each nest containing several or, in the hive bee, many thousand cells: along with each egg sufficient food is deposited to nourish the

FIG. 4.—THE OVARIES OF QUEEN AND WORKERS

larva until it pupates. Nectar and pollen form the food of bees, and their larvae (or brood) are fed upon the same ingredients except that the nectar is regurgitated as honey before being supplied to them. The majority of bees are "solitary," like

other insects, and are represented by ordinary males and females, each female constructing a nest for her brood. On the other hand, the bumble-bees, the hive-bee and the "stingless" bees of the tropics are "social" insects living in large communities. In addition to fertile females (queens) and males, such communities comprise a far greater number of other females, "workers," with imperfectly developed ovaries. Social bees construct nests out of wax secreted by themselves. The social species are treated separately (see BEE-KEEPING; SOCIAL INSECTS). Solitary bees nest in a variety of situations: many, such as *Andrena* and *Halictus*, construct burrows in the ground with the individual cells leading off from the main passage. Others, such as *Osmia*, utilise existing hollows or crevices whether they be in wood, bramble-stems or mortar: they may even occupy empty snail-shells or key-holes. About 10 to 20 cells usually compose a nest, but one of 230 cells is recorded. The mason bee (*Chalicodoma*) of southern Europe builds its nest often on large stones: the individual cells are constructed of soil and small pebbles mixed with saliva and the whole nest is plastered over with the same material until it assumes a dome-shaped form, about the size of half an orange. The carpenter bees of the genus *Xylocopa* include the largest of all bees and are chiefly found in warm countries, although one

FROM CHESHIRE, "BEES AND BEE-KEEPING"

FIG. 5.—UNDER SIDE OF WORKER, SHOWING WAX SCALES ON ABDOMEN

FIG. 6.—MODIFICATIONS IN THE LEGS OF BEES

species occurs as far north as Paris. These giant bees tunnel by means of their powerful jaws in dry wood for a distance of a foot or more, dividing their burrows into a series of cells formed of agglutinated wood particles. The genus *Megachile* includes the leaf-cutting bees which nest in soil, in wood, or in hollow stems. The cells are thimble-like in form and constructed of rounded pieces of leaves or petals which are cut by the jaws of the bee from roses and other plants: the more ovoid pieces form

the bottoms and side-walls of the cells; these are closed by several circular pieces which are firmly pressed down to form closely fitting lids.

A number of solitary bees construct no nests of their own but live asinquilines or "cuckoo-parasites" in those of other species: such bees are less hairy than usual and lack special modifications for pollen-collecting. The black and yellow species of *Nomada* lay their eggs in nests of *Andrena*, and their larvae are nourished at the expense of those of the latter, which become starved out. Another parasitic bee, *Stelis*, utilises a species of *Osmia* as its host: its eggs are laid earlier than those of the *Osmia* and are placed towards the bottom of the food-mass in the cells, whereas the eggs of the host are laid upon the surface of the food. Both larvae feed amicably at first but finally the *Stelis* larva attacks and devours that of the *Osmia*.

BIBLIOGRAPHY.—Many interesting observations on the habits of solitary bees will be found in J. H. Fabre, *Souvenirs Entomologiques* (1879-91) and C. Ferton, *La Vie des Abeilles et des Guêpes* (1923). A very readable account of the chief European species is given by H. Friese, *Die Europäischen Bienen* (1923) and the British species are described and figured by E. Saunders, *The Hymenoptera Aculeata of the British Islands* (1896). (A. D. I.)

BEEBE, CHARLES WILLIAM (1877-), American ornithologist and explorer, was born in Brooklyn, N.Y., July 29, 1877. In 1899, after receiving the degree of B.S. at Columbia university, and completing a year of graduate study, he became honorary curator of ornithology of the New York Zoological society and was later made director of its department of scientific research. He originated the collection of living birds in the New York Zoological park and brought it up to the first rank with a census of 900 species and 3,000 specimens. He also secured many rare marine specimens. His scientific expeditions took him to British Guiana, the Himalayas, Borneo, the Sargasso Sea—places which he described in glamorous prose that won him a high rank among contemporary writers on nature. For his *Monograph of the Pheasants*, later published as *Pheasants, Their Lives and Homes* (1926), he was awarded the Elliott Medal of the National Academy of Sciences.

Beebe has published many scientific papers on birds and evolution. Some of his most popular books are *Two Bird-Lovers in Mexico* (1905); *Jungle Peace* (1918); *Galapagos: World's End* (1923); *Jungle Days* (1925); *The Arcturus Adventure* (1926); and *Pheasant Jungles* (1927).

BEECH, the name for well known trees of the genus *Fagus*, members of the family Fagaceae to which belong the sweet-chestnuts and the oaks. The name beech is from the Anglo-Saxon *boc*, *bece* or *beoce* (Ger. *Buche*, Swedish, *bok*), words meaning at once a book and a beech-tree. The connection of the beech with the graphic arts is supposed to have originated in the fact that the ancient Runic tablets were formed of thin boards of beech-wood. Beech-mast, the fruit of the beech-tree, was formerly known in England as buck; and the county of Buckingham is so named from its fame as a beech-growing country. Beechmast has been used as food in times of distress and famine; and in autumn it yields an abundant supply of food to park deer and other game, and to pigs, which are turned into beech woods in order to utilize the fallen mast. In France it is used for feeding pheasants and domestic poultry. Well-ripened beechmast yields from 17 to 20% of non-drying oil, suitable for illumination, and said to be used in some parts of France and other European countries in cooking, and as a substitute for butter.

There are only eight species and varieties of beeches. The European and American species are much alike, the latter having bark of a lighter colour and somewhat less shiny leaves which drop earlier in autumn than the European species. This species often holds its dead, brown leaves through most of the winter. The winter buds of beech are conspicuously elongated, and the leaves are dentate and shiny with small stipules; the flowers are monoecious. The bark of the American species is light grey and remains so even on very old trunks. The European species has an olive-grey bark which also holds its colour when old. The beech is one of the largest of forest trees. It grows well on dryish sandy loam and limestone soils, shuns swamps, but endures shade. It is one of the main trees of the climax forests because its seedlings

can grow in heavy shade. In this way new trees continue to take the place of old mother trees and no other species can supplant it. Close competitors are the hard maple and the hemlock. The three together make what is called the final type or climax forest of the sections of the world where they thrive. They make the finest forest and are beloved by poets and nature enthusiasts.

In America the beech ranges from New Brunswick to Minnesota and south to Florida and Texas. It is one of the common forest trees of temperate Europe, spreading from southern Norway and Sweden to the Mediterranean. In England it is native but is planted in Scotland and Ireland. It is found on the Swiss Alps to about 5,000 ft. above sea level; it is plentiful in southern Russia, and is widely distributed in Asia Minor, and the northern provinces of Persia. As a forest plant the beech is a very important tree. The hard, close-grained wood, though not especially good for building, is used in the manufacture of furniture, and many other articles. Owing to its handsome foliage, spreading or drooping habit and conspicuous bark, it is unsurpassed as an ornamental tree. The European *Fagus sylvatica*, has a variety *pendula* with drooping or weeping branches, a variety *purpurea* with purple or copper leaves, and several other forms in cultivation. The American species, *Fagus grandifolia*, has also several varieties, as *pubescens*, *caroliniana* and *ferruginea*. There are many horticultural forms that are propagated and grown as ornamental trees. The wood of the beech makes excellent fuel and charcoal.

BEECHAM, SIR THOMAS (1879—), British conductor and impresario, was born on April 29, 1879, the elder son of Sir Joseph Beecham, 1st Baronet. He was educated at Rossall school and Wadham college, Oxford, and gave his first concert with the Queen's hall orchestra in London in 1905. He founded and afterwards conducted the New Symphony and Beecham Symphony orchestras, and also the Beecham Opera Company with which he produced "The Wreckers," among other works, at His Majesty's theatre in 1909. After producing operas by Delius ("Village Romeo and Juliet"), Strauss ("Electra") and others at Covent Garden theatre in the spring of 1910 he followed this season in the summer with another at His Majesty's, which had "Cosi fan tutte," "Il Seraglio," "Feuersnot" and "Shamus O'Brien" among its leading features, and yet another at Covent Garden in the autumn, when Strauss's "Salome" was given for the first time in London. In 1911 and 1912 he was associated with the memorable first appearance in London, at Covent Garden, of the Russian ballet. Not less noteworthy were his activities in 1913, when he produced "Der Rosenkavalier" at Covent Garden in the spring, "Ariadne auf Naxos" in the summer at His Majesty's (in conjunction with Sir Herbert Tree) and in the autumn at Drury Lane a series of Russian operas, including "Boris Godounov," "Ivan the Terrible," and "Khovantchina," in which Chaliapin made his first appearance in England. Subsequent productions for which he was responsible included "Prince Igor," "Coq d'Or," "Nuit de Mai," "Rossignol" and "La Légende de Joseph" in 1914, and a large number of performances in English, given under the most difficult conditions, during the succeeding years of the World War. In 1916 he was knighted, and in the same year he succeeded to the baronetcy. After further seasons in 1919 and 1920 Sir Thomas suspended for some years his operatic activities, which, though so successful artistically, had entailed heavy financial losses, and disbanded his company, whose members subsequently formed themselves into the British National Opera Company and carried on independently upon a co-operative basis. In 1927, however, he took up the cause again and invited the support of the general musical public for an imperial league of opera, having for its object the permanent establishment of opera in London, and also in some of the leading provincial centres, upon an assured financial basis. Under this scheme opera lovers throughout the country were asked to pledge themselves to subscribe 10s. per annum for five years, whereby it was estimated that a sum of £60,000 per annum would be obtained to serve as a subsidy for the undertaking. The project was cordially endorsed by the press and leading musical authorities, but the actual response of the public remains yet (1928) to be announced.

BEECH-DROPS (*Epifagus virginiana* or *Leptamnium virginianum*), a North American perennial of the broom-rape family, *Orobanchaceae*, called also cancer-root. It is parasitic on the roots of the American beech from New Brunswick to Wisconsin, and southward to Florida and Louisiana. The slender, wiry, much-branched brown stems bear scattered inconspicuous scales but no leaves. The numerous flowers are borne in small clusters at the ends of the branches; the uppermost flowers, about $\frac{1}{2}$ in. long, are whitish-purple and sterile, while the lower are minute and seed-bearing. Throughout the woodlands of eastern North America the beech-drops is usually the most common parasitic flowering plant. Its roots are attached by suckers to the roots of the beech and its seeds will germinate only when in contact with the roots of that tree.

BEECHER, CHARLES EMERSON (1856–1904), American palaeontologist, was born at Dunkirk, N.Y., on Oct. 9 1856. He graduated at the University of Michigan in 1878, and then became assistant to James Hall in the New York State Museum at Albany. Ten years later he was appointed to the charge of the invertebrate fossils in the Peabody Museum, New Haven, under O. C. Marsh, whom he succeeded in 1899 as curator. Meanwhile in 1889 he received the degree of Ph.D. from Yale university for his memoir on the *Brachiospongiae*, a remarkable group of Silurian sponges; later on he did good work among fossil corals, and other groups, being ultimately regarded as a leading authority on fossil crustaceans and brachiopods. His researches on the development of the brachiopods, and on the trilobites *Triarthrus* and *Trinucleus*, were especially noteworthy. In 1892 he was appointed professor of palaeontology in Yale university. He died on Feb. 14, 1904.

Memoir by C. Schuchert in *Amer. Journ. Science*, vol. xvii., June 1904 (with portrait and bibliography).

BEECHER, HENRY WARD (1813–1887), American preacher, was born in Litchfield (Conn.), on June 24, 1813, eighth child of the Calvinistic minister Lyman Beecher and his wife Roxana. His early education included six months at his sister Catherine's seminary in Hartford and a dreamy period at the Boston Latin school during which he said he "went to school in Boston harbour"; in 1830 he entered Amherst college. Although achieving no special distinction as a student, he was active in college affairs and through careful training became a fluent extemporaneous speaker and a successful lecturer on temperance and phrenology in his undergraduate days. But he had always looked upon his career as foreordained, and it became a matter of course with him that he should enter the Lane Theological Seminary in Cincinnati (O.), of which his father was president, and from which he graduated in 1837.

AFTER THE STATUE BY WARD IN BOROUGHS HALL PARK, BROOKLYN
HENRY WARD BEECHER.
FAMOUS AS A PULPIT ORATOR OF THE 19TH CENTURY

His home and surroundings at this time provided an unusually literary atmosphere; his elder sister Catherine at 35 years of age already had two books to her credit and one in the press, while Harriet, who was destined to become famous as an authoress later (see **STOWE, HARRIET BEECHER**), had won a 50-dollar prize offered by the *Western Literary Journal*. Henry Ward himself read omnivorously, and when his father needed the Rev. Thomas Brainerd's aid in his heresy trial his 23-year-old son was left in charge of what Harriet called "our family newspaper," the *Cincinnati Journal*.

Probably influenced in part by Calvin Stowe, the youth was already moving away from the stern theology of his father. To his betrothed, Eunice Bullard, he wrote, "I cannot assent. What then? Preach I will, licensed or not. On that point I am determined. If I can do no better, I will go far out into the West, build a log cabin among the lumbermen and trappers, or whoever may seek employment in the forests, and devote myself to trying to

interest them in religious services, far from the busy haunts of men. What will you do if this is the only course left me? Will you go with me into the wilderness?" It was not necessary for the young preacher and his bride to go into the wilderness. Receiving a subsidy from the Home Missionary Society, he took up his pastorate at Lawrenceburgh, a little river town in Indiana, where he acted both as sexton and preacher. Two years later he accepted a call to a new church in Indianapolis. His *Seven Lectures to Young Men*, which appeared in 1844, in which he treated the commoner vices with realistic description and with youthful and exuberant rhetoric, won him not only a local but a national reputation. As a result of this literary success, added to his activity in the State Horticultural Society, he was made editor of the *Western Farmer and Gardener*, which further helped to make his name more widely known. In 1847 he accepted a call to the pastorate of Plymouth church (Congregational), then newly established in Brooklyn, New York. The situation of the church in such close proximity to New York, the stalwart character of the man who had organized it, and the peculiar eloquence of Beecher combined to give it probably the largest membership of any congregation of the day. Beecher at once became a recognized leader. Although investigations have shown that he may have been rather more backward even than other members of his family and church in declaring against slavery, and although he was never technically an abolitionist, the dramatic scene of his mock public auction of the white slave girl has impressed itself in the popular mind as one of the outstanding episodes in the anti-slavery crusade. His attitude was that slavery was to be overthrown under the Constitution and in the Union by trusting to an awakened conscience, enforced by an enlightened self-interest. Later he also identified himself with the woman suffrage movement.

Large as was Beecher's church and lecture audience, his sphere of influence was still further extended by his contributions to the *Independent*, to Robert Bonner's *Ledger* and to other periodicals. He was editor-in-chief of the *Independent* from 1861 to 1863, and in 1870 he founded and became editor-in-chief of a religious undenominational weekly, *The Christian Union*, afterwards the *Outlook*, in which as in his pastorate of Plymouth church he was succeeded by Lyman Abbott (*q.v.*). Nevertheless, it was in the pulpit that Beecher was seen at his best. Because of his mastery of the English tongue, his dramatic power, his vivid imagination, the catholicity of his sympathies, his passionate enthusiasm which for the moment made his immediate theme seem to him the one theme of transcendent importance, his humour alternating with pathos, he was a preacher with an almost unrivalled following in his own time and country. John Hay called him "the greatest preacher the world has seen since St. Paul preached on Mars Hill." His favourite theme was love: love of man was to him the fulfilment of all law, love of God was the essence of all Christianity; religion was a life of liberty in love. The later years of his life were darkened by the charge which was brought against him by Theodore Tilton of having had improper relations with Tilton's wife, and both before and during the law suit in which it involved him his reputation as a man of honour and as a clergyman suffered. During a part of this time he also was the first incumbent of the Lyman Beecher lectureship on preaching at Yale Divinity school. He died of apoplexy in Brooklyn on March 8, 1887.

Beecher's books, besides his published sermons, include: *Plymouth Collection of Hymns and Tunes* (1855); *Star Papers* (1855); *New Star Papers* (1859); *American Rebellion, Report of Speeches delivered in England at Public Meetings in Manchester, Glasgow, Edinburgh, Liverpool, and London* (1864); *Norwood: A Tale of Village Life in New England* (1867); *The Life of Jesus the Christ* (1871), completed by his sons (1891); and *Yale Lectures on Preaching* (1872-74).

Among the works on Beecher are: N. L. Thompson, *The History of Plymouth Church* (1847-72); monographs by Felix Adler (1887); F. S. Child (1887); T. W. Hanford (1887); T. W. Knox (1887); W. C. Beecher, Rev. Samuel Scoville and Mrs. H. W. Beecher (1888); J. R. Howard (1891); J. H. Barrows (1893); Lyman Abbott (1903); Paxton Hibben (1927), which contains further bibliography.

BEECHER, LYMAN (1775-1863), American clergyman, born at New Haven (Conn.) on Oct. 12, 1775, was a descendant of one of the founders of the New Haven colony. He graduated from Yale (1797) having studied theology under Timothy Dwight. He preached in several churches in the east and in the Second Presbyterian church of Cincinnati (O.) and became president and professor of didactic and polemic theology (1832-50) of the newly established Lane theological seminary at Cincinnati. The last ten years of his life were spent with his son, Henry Ward Beecher, in Brooklyn (N.Y.), where he died on Jan. 10, 1863. Magnetic in personality, incisive and powerful in manner of expression, he was in his combative prime an unusually eloquent pulpit orator.

His daughter, CATHERINE ESTHER (1800-1878), was born at East Hampton (L.I.) on Sept. 6, 1800. She was educated at Litchfield seminary, and conducted schools for girls in Hartford (Conn.) and in Cincinnati. She wrote and lectured on education of women and in favour of better primary schools; she radically opposed suffrage and college education for women, holding woman's sphere to be domestic. The National Board of Popular Education, a charitable society which she founded, sent hundreds of women as teachers into the south and west. She died on May 12, 1878, in Elmira (N.Y.). Among her publications are *An Essay on Slavery and Abolition with Reference to the Duty of American Females* (1837); *A Treatise on Domestic Economy* (1842); *The True Remedy for the Wrongs of Women* (1851); and *Woman's Profession as Mother and Educator* (1871).

His son, EDWARD BEECHER (1803-1895), was born at East Hampton, (L.I.) on Aug. 27, 1803, graduated from Yale in 1822, and studied theology at Andover. He held several pastorates; from 1830-44 he was president of Illinois college, Jacksonville (Ill.); he was senior editor of the *Congregationalist* (1849-55), and an associate editor of the *Christian Union* from 1870. In 1872 he settled in Brooklyn (N.Y.), where he was pastor of the Parkville church (1885-89), and where he died on July 28, 1895. He wrote *History of the Alton Riots* (1837), *Statement of Anti-Slavery Principles* (1837), and several religious books.

CHARLES BEECHER (1815-1900), another of Lyman's sons, was born at Litchfield (Conn.) on Oct. 7, 1815. He graduated from Bowdoin college in 1834, and held pastorates at Fort Wayne (Ind.), Newark (N.J.), and Georgetown (Mass.). From 1870-77 he lived in Florida, where he was State superintendent of public instruction (1871-73). He died at Georgetown (Mass.) on April 21, 1900. He was an accomplished musician, and assisted in the selection and arrangement of music in the *Plymouth Collection of Hymns and Tunes*. His works include *David and His Throne* (1855), and *Spiritual Manifestations* (1879).

See Lyman Beecher, *Collected Works* (1852); *Autobiography and Correspondence* (1863-64), ed. by Charles Beecher; and studies by D. H. Allen (1863), J. G. White (1882), and E. Havvard (1904); see also Constance M. Rourke, *Trumpets of Jubilee* (1927).

BEECHEY, FREDERICK WILLIAM (1796-1856), English naval officer and geographer, son of Sir William Beechey, R.A., was born in London on Feb. 17, 1796. In 1806 he entered the navy. In 1818 he served under Lieutenant (afterwards Sir) John Franklin in Buchan's Arctic expedition, of which at a later period he published a narrative; and in the following year he accompanied Lieutenant W. E. Perry in the "Hecla." In 1821 he took part in the survey of the Mediterranean coast of Africa under the direction of Captain, afterwards Admiral, William Henry Smyth. He and his brother Henry William Beechey, made an overland survey of this coast, and published a full account of their work in 1828 under the title of *Proceedings of the Expedition to Explore the Northern Coast of Africa from Tripoly Eastward in 1821-1822*. In 1825 Beechey was appointed to command the "Blossom," which was intended to explore Bering strait, in concert with Franklin and Parry operating from the east. He passed the strait and penetrated as far as 71° 23' 31" N and 156° 21' 30" W, reaching a point only 146m. west of that reached by Franklin's expedition from the Mackenzie river. The whole voyage lasted more than three years, and in the course of it Beechey discovered several islands in the Pacific, and an excellent harbour near Cape

Prince of Wales. In 1831 there appeared his *Narrative of a Voyage to the Pacific and Bering's Strait to Co-operate with the Polar Expeditions, 1825-1828*. In 1835 and the following year Captain Beechey was employed on the coast survey of South America, and from 1837 to 1847 carried on the same work along the Irish coasts. He was appointed in 1850 to preside over the marine department of the Board of Trade. In 1854 he was made rear-admiral, and in the following year was elected president of the Royal Geographical Society. He died on Nov. 29, 1856.

BEECHEY, SIR WILLIAM (1753-1839), English portrait-painter, was born at Burford on Dec. 12 1753, and died on Jan. 28 1839. He became a pupil at the Royal Academy in 1772. Some of his smaller portraits gained him considerable reputation, and in 1793 he was made portrait-painter to Queen Charlotte. He painted the portraits of the members of the royal family, and of nearly all the most famous or fashionable persons of the time, some of which are in the National Gallery and at Hampton Court. A fine example, "The Brother and Sister," is in the Louvre. His picture, now in Kensington Palace, of a review of cavalry in Hyde Park, earned him a knighthood in 1798. In the foreground of this painting he introduced portraits of George III., the prince of Wales, and the duke of York, surrounded by a brilliant staff on horseback.

BEECHING, HENRY CHARLES (1859-1919), dean of Norwich and poet, was born May 15 1859, and educated at the City of London school and at Balliol college, Oxford. He took holy orders in 1882, and after three years in a Liverpool curacy he was for fifteen years rector of Yattendon, Berkshire. From 1900 to 1903 he lectured on pastoral and liturgical theology at King's college, London, and was chaplain of Lincoln's Inn, where he became preacher in 1903. He became a canon of Westminster in 1902, and examining chaplain to the bishop of Carlisle in 1905. In 1911 he became dean of Norwich, where he died on Feb. 25 1919. As a poet he is best known by his share in two volumes—*Love in Idleness* (1883) and *Love's Looking Glass* (1891)—which contained also poems by J. W. Mackail and J. Bowyer Nichols. He was a sympathetic editor and critic of the works of 17th century poets, of Richard Crashaw (1905), of Herrick (1907), of John Milton (1900), of Henry Vaughan (1896). He published anonymously *Pages from a Private Diary* (1898), the second edition of which (1903) bore the pseudonym Urbanus Sylvan. A second volume of essays in 1906 was entitled *Provincial Letters and other Papers*. His works also include numerous volumes of sermons and essays on theological subjects.

BEECHWORTH, a town of Bogong county, Victoria, Australia. Pop. c. 8,000. The town is a centre of gold-mining (Ovens goldfields) but much of the surrounding land is under fruit and grain cultivation. The main industries of the town are tanning, ironfounding and coach-building.

BEEF, flesh from mature cattle used as a food. It contains the highest form of protein for human consumption, in the most palatable, stimulating and digestible form. It is an energy producer and a muscle builder; it supplies mineral salts and the three principal groups of vitamins. Combined with vegetables, it makes an ideal food in a mixed diet, the nutritive superiority of which long years of human history have demonstrated. There are eight standard wholesale cuts from a beef carcass; viz., the round, loin, flank, rib, chuck, plate and shank, and suet secured from the free fat of the animal. There is a pronounced difference in the value of various carcasses and in the value of the cuts produced from different parts of the same carcass. The quality of the carcass is dependent upon the relative thickness of the lean meat, tenderness, interspersions of fat among the muscle fibres, firmness of flesh, freedom from bruised spots, rich redness of the lean meat and the clear white of the sound firm fat. The division of beef into joints for retail is different from the wholesale division. The chief joints are: *Forequarter*, fore rib, middle rib, chuck rib, leg-of-mutton piece, brisket, clod, neck, shin, cheek; *Hindquarter*, sirloin, rump, aitchbone, round, topside, silverside, thick flank, mild flank and leg. (T. G. L.)

Although the total quantity of meat of all kinds in each year produced is unknown, it is certain that the consumption of

beef is greater than that of any other form of animal food. In England half the meat produced is beef or veal, the average quantity being 343,000 tons of beef and 30,000 tons of veal out of a total meat production of 746,000 tons. The British imports of beef in 1926 were as follows:—

	Tons.
Fresh	2,076
Chilled	483,917
Frozen	179,335
Tinned, salted, etc.	56,030
Total	721,358

Of this total 62% was chilled beef from Argentina, which also sent 72,000 tons of frozen beef. Other chief sources of British supply are Australia, Uruguay and New Zealand.

The international meat trade began with the exportation of tinned or canned beef from Australia. The earliest specimens of this method of preserving meat were shown at the Great Exhibition in London in 1851. Used at first chiefly on ships it gradually became established in the market, and by the end of the 'sixties was largely imported. Soon afterwards the experiment of sending beef from the United States in a frozen state was tried, not very successfully; but in 1875 the first shipment of "chilled" beef to England was made by T. C. Eastman from New York. The trade rapidly increased, and by 1880 all the steamships on the transatlantic route had a refrigerating equipment. That in common use consisted of an ice box and fans to keep the cold air circulating, and in other cases a freezing mixture—salt and ice—was pumped along pipes close to the beef.

With the development of refrigeration, oversea British supplies of beef were divided into two classes viz., (a) chilled, (b) frozen. Chilled beef is shipped in cold chambers, where it is kept at a temperature a little above freezing point. It must, however, go into consumption in not more than six to eight weeks. Frozen beef is, in fact, reduced to a temperature below freezing point, and if so kept can be stored for a long time without deterioration. All beef shipped from Australia and New Zealand is frozen. From South America the greater part is exported in a chilled state.

From the meat trader's point of view imported beef is classed in the following order: (1) South American chilled, (2) South American frozen, (3) best Australian frozen, (4) best New Zealand frozen.

The total value of the international trade in beef is nearly £40,000,000. Prior to the War Great Britain was practically the only market, but in recent years the continent of Europe has taken a certain quantity, small in relation to the total trade and restricted generally to the lower qualities.

Among the sources of supply South America stands first. Argentina holds a dominating position, but Uruguay is also important, and there are possibilities of development in other parts of South America; e.g., Chile, Brazil, Venezuela, Paraguay and Colombia.

Australia ranks next to Argentina as a supplier of beef to the British market. Queensland is the beef exporting state of the Commonwealth, other states; e.g., New South Wales and Victoria, being more concerned in the mutton and lamb trade. In competition with South America, Australia is handicapped by distance and by climate. Meat vessels take about three weeks for the voyage from the River Plate to London and five to six weeks from Australia. The liability to drought and consequent shortage of grass not only makes cattle-raising a precarious business but affects the regularity of supplies to the meat works. Unlike South America, Queensland has a beef "season"; i.e., killing does not take place throughout the year. The duration of the season depends on the weather; if there has been sufficient rainfall cattle may be sufficient in numbers and finish to supply the works until the latter part of the year, but, on the other hand, the works may not be able to operate for more than three or four months. Queensland beef is graded in three qualities, viz., first quality known as "g.a.q." (good average quality), second quality "f.a.q." (fair average quality), and third quality known as "second f.a.q." The last is not usually sent to the British market, but is exported to the continent of Europe or used for canning.

South Africa has begun to export beef and veal. In 1923 a Beef Export Bounties Act was passed authorizing the payment of ½d. per lb. on beef exported. The exports rose at once from 275 tons in 1924 to 3,836 tons in 1925. Beef is shipped to Italy and Belgium as well as to Great Britain.

Beef of the first quality is produced in Great Britain, and at its best commands the highest price in the market. But first quality chilled beef competes closely with English beef of second quality. The trade in imported beef is highly organized, and the powerful companies owning freezing works in the Argentine and elsewhere have very efficient distributive agencies throughout Great Britain.

The imported beef which now rivals the British home product owes its excellence to the fact that the cattle which supply it have been developed by the use of British stock, which was bought lavishly and at very heavy cost by breeders, first in the United States and subsequently in South America and the British Dominions. (See CATTLE.) (R. H. R.)

Beef Tea is a light broth made from lean beef, popular in the sick room because it contains proteins in soluble form and stimulates the appetite. A favoured formula for beef tea calls for a pound of finely cut lean beef placed in a tightly covered jar containing two pints of cold water and a pinch of salt. The jar is immersed to the height of its contents in a kettle of warm water, allowed to simmer for two hours with the temperature at all times below the boiling point. In a second recipe, the same amount of lean beef is allowed to stand for two hours in one pint of cold water and then simmered for three hours at a maximum temperature of 160° F. Any water lost by evaporation is replaced by cold water, so that upon completion of the process a pint of the broth results. In either case, if desired, a flavour can be imparted by adding carrots, celery, mixed herbs, onion or bay leaf previously scraped to a pulp. Beef tea with oatmeal and beef tea egg nog require, in the former case, the addition of oatmeal and in the latter, brandy and an egg. The latter broths are, of course, more highly nutritious than the first two types.

BEEF-EATER: see YEOMAN OF THE GUARD.

BEEFSTEAK CLUB, the name of several clubs formed in London during the 18th and 19th centuries. The first seems to have been that founded in 1709 with Richard Estcourt, the actor, as steward: its badge was a gridiron. Its fame was eclipsed in 1735 when "The Sublime Society of Steaks" was established by John Rich at Covent Garden theatre, of which he was then manager. It is said that Lord Peterborough supping one night with Rich in his private room, was so delighted with the steak the latter grilled him that he suggested a repetition of the meal the next week. From this started the club: among its members, who called themselves "the Steaks," were Hogarth, Garrick, Wilkes, Bubb Doddington and many other celebrities. The rendezvous was the theatre till the fire in 1808, when the club moved first to the Bedford Coffee House, and the next year to the Old Lyceum. In 1785 the prince of Wales joined, and later his brothers the dukes of Clarence and Sussex became members. On the burning of the Lyceum, "The Steaks" met again in the Bedford Coffee House till 1838, when the New Lyceum was opened, and a large room there was allotted the club. The club ceased to exist in 1867. Thomas Sheridan founded a Beefsteak Club in Dublin at the Theatre Royal in 1749, and of this Peg Woffington was president. The modern Beefsteak Club was founded by A. Stuart-Wortley in 1876. Its first premises were over Toole's theatre in King William St. Strand. In 1898 it moved to its present residence in Green St., Leicester Sq.

See J. Timbs, *Clubs and Club Life in London* (1873); Walter Arnold, *Life and Death of the Sublime Society of Steaks* (1871).

BEE-KEEPING. Though bee-keeping is known to have existed from the most ancient times, it may be said that during the last 50 years almost everything connected with bee craft has been revolutionized; nor has this revolution been confined to any country, but remarkable progress has been made in all countries where commercial bee-keeping is carried on. In no branch of the craft has more progress been made than in that of queen

rearing. In both Europe and America queen-rearing apiaries are plentiful, and in England some bee-keepers include queen rearing on the latest scientific systems, as well as breeding by selection and cross-breeding from such races as appear most suited to the exceptional climatic conditions, as a part of their business. The consumption of honey as an article of food has also largely increased of late years; and the value of bee-keeping as an occupation has now been recognized by the British Government as worthy of encouragement, by the promotion of technical education

FROM "THE A. B. C. OF BEE CULTURE"

FIG. 1.—SECTIONS OF BOX TO HOLD HONEY-COMB

This type in general use holds about 1 lb. of comb honey. In the United States and Canada it is made of basswood

in the craft and by providing funds for research. The value of the bee, moreover, to the fruit grower and the gardener is beyond dispute, and the fruit growing districts are known to be greatly benefited by the colonies of bees established in their midst.

Bee-keepers' Associations.—The British Bee-keepers' Association (instituted in 1874) has been untiring in its efforts to raise the standard of efficiency among those who are desirous of qualifying as experts and teachers of bee-keeping on modern methods. This body had for its first president the distinguished naturalist Sir John Lubbock (Lord Avebury). Subsequently the Baroness Burdett-Coutts accepted the office in the year 1878, and was re-elected annually until her death in 1906. Other societies of bee-keepers were established throughout the English counties, with the object of securing co-operation in promoting the sale of honey, and showing the most modern methods of producing it in

FROM CHESHIRE, "BEES AND BEE-KEEPING"

FIG. 2.—SECTIONS OF A STRAW SKEP, THE FAMILIAR DOME-SHAPED HIVE, SHOWING VERTICAL AND HORIZONTAL SUB-DIVISIONS, AND ARRANGEMENT OF COMBS

its most attractive form at exhibitions held for the purpose. Many of these county societies are affiliated with a central association, paying an affiliation fee yearly, and employ qualified men who visit members in spring and autumn for the purpose of examining hives and giving advice on bee management to those needing it. Another advantage of membership is the use of a "county label" for affixing to each section of honey in comb, or jar of extracted honey, offered for sale by members. These labels are numbered consecutively, and thus afford a guarantee of the genuineness and quality of the honey, the label enabling purchasers to trace the producer if needed. The British Bee-keepers' Association is an entirely philanthropic body. The Scottish Bee-keepers' Association and the Apis Club are other important bodies, which, independently of the British Bee-keepers' Association, exercise a wide influence. There are also many equally beneficial societies, framed on different lines, existing in Germany, France, Russia, Switzerland, the United States, Canada and most of the British colonies.

The Bee-appliance Trade.—As a natural consequence of this activity, the trade in bee-appliance making has assumed enormous

proportions. In the United States extensive factories have been established, using electric-power machinery of the most modern type devoted entirely to the manufacture of apiarian requisites, and millions of the small wooden boxes used for holding comb-honey are made and exported. The most generally approved form of this box is made from a strip of wood $\frac{1}{8}$ in. thick, $1\frac{1}{8}$ in. wide, and of such length that when folded by joining the mortised and tenoned ends (see fig. 1) it forms the section or box, measuring $4\frac{1}{4} \times 1\frac{1}{8}$ ". The gross weight is usually less than 16 ounces, although this type of box is sometimes called a "1-pound section."

FROM CHESHIRE, "BEES AND BEE-KEEPING"

FIG. 3.—HUBER'S BOOK, OR LEAF, HIVE, 1789, THE FIRST STAGE IN THE DEVELOPMENT OF THE MODERN MOVABLE-FRAME HIVE

This hive consists of 12 wooden frames hinged together, the outer two, corresponding to the covers of a book, being fitted with glass

Generally regulations require that the sections be marked with their net weight. The V-shaped groove (cut across and partly through the wood; see inset, fig. 1) shows the joint when in the flat, and the same joint when closed is shown immediately below it. The section boxes used in the United Kingdom are made in the United States or Canada from the timber known as basswood, no native wood being suitable for the purpose.

Development of the Movable-comb Hive.—The dome-shaped straw skep of our forefathers, though it has now largely disappeared save from the more remote parts of the country, may be regarded as the traditional bee-hive of all time. A swarm of bees hived in a straw skep will furnish their home with waxen combs admirably adapted to their requirements. Fig. 2 shows a straw skep in section, and illustrates the admirable way in which the bees furnish their dwelling. The vertical section displays the lower portion of the combs devoted to brood-rearing, the higher combs being reserved for honey, and between the brood and food is stored the pollen required for mixing with honey in feeding the larvae. The horizontal section demonstrates the bee's ingenuity in economizing space, showing how the outer combs are used exclusively for stores. The straw skep had, however, the irredeemable fault that it was not open for handling and inspection and both comb and honey were irremovable without the destruction of the hive. The gradual development of the movable-comb hive of to-day may be said to have first appeared in 1789, when the distinguished Swiss naturalist and bee-keeper, François Huber, was led to construct the leaf-hive bearing his name after experimenting with a single comb glass sided observatory hive recommended by Réaumur. Huber decided to have a series of wooden frames made, measuring 12 in. square, each of rather more than the ordinary width allowed for brood-combs.

These frames were numbered consecutively 1 to 12, and hinged together as shown in fig. 3. In this way the twelve frames of comb could be opened for inspection like a book, while when closed the bees clustered together as in an ordinary hive. When closed, the ten frames together with the two outside ones (fitted with squares of glass for inspection), which represent the covers of the book, were tied together with a couple of stout strings. In a subsequent form of the same hive Huber was enabled (with the help of very long thumb-screws at each side to raise up any frame between two sheets of glass which confined the bees and

FIG. 4.—THE STANDARD FRAME OF GREAT BRITAIN, 14 X 8 1/2 INCHES

allowed him to study the process of comb-building as well as in any hive we know of to-day. It must be admitted that Huber's hive was defective in many respects; but it remained the only movable-comb hive till 1838, when Dr. Dzierzon (whose theory of parthenogenesis has made his name famous) devised a box-hive with a loose top-bar on which the bees built their combs, and a movable side or door, by means of which the combs could be lifted out for inspection. This improvement was at once appreciated, and in the year 1852 Baron Berlepsch added side-bars and a bottom-bar, thus completing the movable frame of comb. About the same time the Rev. L. L. Langstroth was experimenting on the same lines in America, and in 1852 his important invention was made known, giving to the world of bee-keepers a movable frame which in its most important details is not likely to be excelled. We refer to the respective distances left between the side-bars and hive walls on each side, $\frac{1}{4}$ in., and between the lower edge of the bottom-bars and the floor-board, $\frac{1}{2}$ in. Langstroth, in his measurements, hit upon the happy mean which keeps bees from propolizing or fastening the frames to the hive body by filling the space with comb which rendered the frame immovable. In addition to these benefits, Langstroth's frame and hive possessed the enormous advantage over Dzierzon's of being manipulated from above, so that any single frame of comb could be raised for inspection without disturbing the others. Langstroth's space-measurements have remained unaltered, notwithstanding the many improvements in hive-making and in the various sizes of frames since introduced and used in different parts of the world.

Standard Hives.—In the British Isles only one size of frame is acknowledged by the great majority of bee-keepers, viz., the British Bee-keepers' Association "Standard" (fig. 4).

FROM "THE A B C OF BEE CULTURE"

FIG. 5.—THE IMPROVED LANGSTROTH HIVE

This type, popular among American bee-keepers, has a flat roof-board covering the frames allowing $\frac{1}{4}$ in. between roof and top bars for bees to pass from frame to frame

improved Langstroth (fig. 5), which has no other covering for the frame tops but a flat roof-board allowing $\frac{1}{4}$ in. space between the roof and top-bars for bees to pass from comb to comb. Consequently on the roof being raised the bees can take wing. This feature finds no favour with British bee-keepers, nevertheless the "improved Langstroth" is practically the universal standard in the United States, Canada, New Zealand and Australia. In the colder parts of America bee-keepers find it necessary to provide underground cellars, into which the bees are carried in the fall of each year, remaining there till work begins in the following spring. One of the best-known hives in England is the W.B.C. hive, devised in 1890 by the late W. Broughton Carr. Figs. 6 and 7 explain its construction and, as will be seen, it is equally suitable when working for comb or for extracted honey. The outer cases of some modern hives are made tapering, wider at the bottom than at the top, so there is no need for the outside plinth to cover the joint. The outside plinth is a source of trouble, as wet penetrates between it and the case, causing the wood to rot. A narrow plinth inside the tapering covers prevents the upper one dropping too far down and becoming wedged fast on the one immediately underneath it.

Honey Extractors.—Regarding the method of extracting honey it cannot be said that up to 1923 the honey extractor differed very much from the original machine (fig. 8) invented by Major Hruschka, an officer in the Italian army. Hruschka's extractor, first brought to public notice in 1865, made use of the principle of centrifugal force for throwing the liquid honey out

of the comb cells, thus increasing the output without damaging the combs, and in a fraction of the time previously occupied in the draining, heating and squeezing process. At the same time the combs were preserved for refilling by the bees, in lieu of melting them down for wax. Since that time changes of more or less value have been introduced to meet present-day requirements. A simple form of machine for extracting honey by centrifugal force was brought to notice in England in 1875, and was soon improved upon. T. W. Cowan, who was experimenting in the same direction in England, invented in the same year a machine called the "Rapid," in which the combs were reversed without removal of the cages (fig. 9). The frame-cases (wired on both sides) are hung at the angles of a revolving ring of iron, and the reversing process is so simple and effective that the "Cowan" reversible frame has been adopted in most of the best machines both in Great Britain and in America. The latest form of honey extractor works on a different system. Centrifugal force is still employed, but the combs are arranged radially, the bottom bar of the frames being near the centre, and the top bar at the circumference of the cylinder, so that when in position they are at right angles to that in the "Cowan" type. By this arrangement the honey is extracted from both sides of the comb at one operation. The combs do not need reversing, and a greater number can be extracted at one time without increasing the size of the cylinder. For large apiaries where power is available, these extractors may be made to carry up to 45 combs.

Comb Foundation.—Next in importance for bee-keepers is the enormous advance made in late years in manufacturing the impressed wax sheets known as "comb foundation," aptly so named, because upon it the bees build the cells wherein they store their food. It is unnecessary to dwell upon the evolution

FIG. 7.—INTERIOR OF A W.B.C. HIVE, SHOWING AIR SPACE BETWEEN OUTER CASE AND THE HIVE PROPER, ALSO POSITION OF QUEEN EXCLUDER, SHALLOW COMB BOX AND SECTION RACK

from the crude idea, which first took form in the endeavour to compel bees to build straight combs in a given direction by offering them a guiding line of wax along the under side of each top-bar of the frame in which the combs were to be built. In 1857, Mehring, a German, made use of wooden moulds for casting sheets of wax impressed with the natural hexagonal form of the bee-cell. Afterwards plates cast from metal were employed. Fig. 10 shows a portion of one of these metal plates with worker-cells of natural size, *i.e.* five cells to the inch. Thus Mehring is justly claimed as the originator of comb foundation, though not until nearly 20 years later was any prominence given to it, when Samuel Wagner, founder and editor of the *American Bee Journal*, warmly advocated it in his paper. Mr. Wagner first conceived the idea of adding slightly raised side walls to the hexagonal outlines of the cells, by means of which the bees are supplied with the material for building out one-half or more of the complete cell walls or sides. A. I. Root, of Medina, O., suggested the substitution of embossed rollers in lieu of flat plates, in order to increase the output of foundation and lessen its cost to the bee-keeper, and mainly through the inventive genius of a skilled machinist (A. Washburn) the A. I. Root Co. constructed a roller press (fig. 11) for producing foundation in

FIG. 6.—THE W.B.C. HIVE, SUITABLE FOR COMB OR EXTRACTED HONEY

sheets. The first roller press was imported into Great Britain by William Raitt, a Scottish bee-keeper of repute in Perthshire, N.B. In all roller machines used at that time the plain sheets of wax were first made by repeated dippings of damped boards in molten wax until the sheet was of suitable thickness for the purpose. The prepared sheets were then passed through the rollers and after being cut out and trimmed were ready for use. Owing to the enormous demand for comb foundation at that time various devices were tried with the view of securing (1) more rapid production, and (2) a foundation thin enough to be used in surplus chambers when working for comb-honey intended for table use. Foremost among the able men who experimented in this latter direction was E. B. Weed, a skilful American machinist, who succeeded in devising and perfecting special rollers and dies, by the use of which foundation was produced with a midrib so thin as to compare favourably with natural comb built by the bees, and in the end Weed, acting in concert with A. I. Root, devised and perfected machinery for manufacturing foundation by what is known as the "Weed" process. By this process "dipping" is abolished, and in its latest form sheets of wax of any length are produced, passed between engraved rollers 6 in. in diameter cut to given lengths, trimmed, counted and paper-tissued ready for packing, at a rate of speed previously undreamt of.

Practical Management of Bees.—The honey-bee stands pre-eminent among insects as the most serviceable to mankind. In gathering pollen and honey for the hive it is also fertilizing the flowers, by means of the pollen which it carries from one flower to another. Nothing seems to be lost, the very wax from which the insect builds its combs is valuable to mankind in many ways,

FROM "THE A B C OF BEE CULTURE"

FIG. 8.—HRUSCHKA HONEY EXTRACTOR
Invented in 1865 by Major Hruschka, this machine worked on the centrifugal principle rapidly superseded the old heating and squeezing process

and is regarded to-day no less than in the past ages as an important commercial product. In dealing with the practical side of apiculture, however, it will not be necessary to do more than mention the salient points to be considered by those desirous of acquiring more complete knowledge of the subject. Authoritative text-books specially written for the guidance of bee-keepers are numerous and cheap, and on no account should anyone engage in an attempt to manage bees on modern lines without a careful perusal of one or more of these. So much of the natural history of the honey-bee as is

necessary for elucidating the practical aspects of bee-keeping is comprised in the sections on life of the insect, its mission, and the means whereby to utilize to the utmost the brief period during which it labours before being worn out with toil

The Bee Colony.—A prosperous bee colony managed on modern lines will in the height of summer consist of three kinds of bees: a queen or mother-bee, up to 200 drones, and from 80,000 to 100,000 workers (fig. 12). With regard to sex, the queen is a fully-developed female, the drones are males and the workers may be termed partially developed females. The relative importance of the three kinds of bees differs greatly in degree and in somewhat curious fashion. For instance, the queen (or "king," as it was termed by our forefathers) is of paramount importance at certain seasons, her death or disablement during the period when the male element is absent meaning extinction of the whole colony. Fecundation would under such conditions be impossible, and without this the eggs of a resultant queen will produce nothing but drones. During the summer season, however (from May to July), when drones are abundant, the loss of a queen is of less moment, as the workers can by building a special "queen" cell around any worker egg, or by the special feeding of a worker larva not more than three days old, produce a fully developed queen capable of fulfilling all the maternal functions of a mother-bee and laying about 1,200 eggs per day. The highest recorded number of

eggs laid by a queen is about 1,800. Under normal conditions the queen bee will live for three, four or sometimes five years, but queens are usually superseded after their second season has expired and egg-production gradually decreases. The illustration given in fig. 13 shows the various cells (natural size) built for (and occupied by) queens, drones and workers; also the larvae or grubs in the various stages of transformation from egg to perfect insect, with the latter biting their way out of sealed cells. It also shows sealed honey and pollen in cells, etc.

Drones and Workers.—Drones (or male bees) are more or less numerous in hives according to the skill of the bee-keeper in limiting their production. The modern bee-keeper, therefore, allows only so much drone comb in the hive as will produce a sufficient number of drones to ensure queen-mating. The action of the bees themselves makes this point clear, for so long as honey is being gathered in plenty drones are tolerated, but no sooner does the honey harvest show signs of being over than they are mercilessly killed and cast out of the hive by the workers. It is on the aptly named worker-bee that the entire labour of the colony devolves. The worker-bees are incapable of egg-production and can therefore take no part in the perpetuation of their species. Their mission is work. Collectively they are the rulers on whom the colony depends for the wonderful condition of law and order which has made the bee-community a model of good government. The period of a worker-bee's existence is not measured by numbering its days but simply by wear and tear; after six or seven weeks of strenuous toil, such as the bee undergoes in summer time, the little creature's labour is ended by a natural death. On the other hand, worker-bees reared in the autumn will be able to take their share in the labour of the hive in the early spring, when the young bees are being bred to take their places as they die off, this being the most critical period in the colony's existence; hence the value to the apiarist of bees in the autumn.

Swarming.—The increasing warmth of each recurring spring finds the bee active. The earliest nectar and pollen are sought out from far and near and have an immediate effect upon the mother bee of the colony. She begins egg-laying at once and brood-rearing proceeds at an ever-increasing rate as each week passes, until the hive is brimming over with bees in time for the first honey flow. If there is no cell-room either for storing the food constantly being brought in, or for the thousands of eggs which a prolific queen will produce daily unless help comes from without, an exodus is now prepared for, and what is known as "swarming" takes place. It would be difficult to imagine anything more exciting to a beginner in bee-keeping than the sight of his first swarm. The bees run in frantic haste from the hive like a living stream, filling the air. Among them the queen of the colony will in due course have taken her place, bound like her children for a new home. In a short time they begin to form a solid cluster usually on the branch of a tree or bush, with the queen in the centre. When this stage of swarming is reached the bee-keeper has but to take his hiving box, hold it under the swarm, and shake (or where the conditions do not allow, quickly but gently and firmly brush) the bees into it, preparatory to transferring them into a movable comb hive prepared for their reception. The process of hiving a swarm is very simple, but the apiarist would do well to prepare

himself beforehand by carefully reading the directions in his text-book. To the modern bee-keeper the issue of a swarm from a hive means a great reduction in the amount of honey obtained from that colony owing to the loss in number for a swarm from a modern hive will usually contain 20,000 or more bees. His aim is, therefore, to prevent natural swarming as much as possible, generally by affording additional room beforehand in the hive and by special manipulations of the colony.

Bee-forage.—The main consideration in establishing an apiary is to secure a favourable location, where honey of good marketable quality may be gathered from the bee-forage growing around

FIG. 9.—COWAN'S "RAPID" EXTRACTOR

FIG. 10.—COMB FOUNDATION. SHOWING PORTION OF TYPE-METAL PLATE

without any planting on the part of the bee-keeper himself. The bee-keeper's object is to utilize to the utmost the brief space of a worker-bee's life in summer by adopting the best methods for building up stocks to full strength before the honey-gathering time begins. In the United Kingdom there is a difference of several weeks in the honey season between north and south. The weather is naturally more precarious in autumn than earlier in the year, and chances of success proportionately smaller for northern bee-men, but this disadvantage is to a great extent compensated for by the heather season in the north, which extends well into September. With regard to the British bee-keeper located in the south, the early fruit crop is what concerns him most, and he may secure surplus honey from the fruit bloom; in fact in the fruit growing districts the flowers of the fruit trees may be the only source from which the bees are able to store surplus honey. But the main honey crop of both north and south is gathered from the various trifoliums, among which the white Dutch or common clover (*Trifolium repens*) is acknowledged to be the most important honey-producing plant wherever it grows.

Bee Handling.—Before undertaking the management of a modern apiary, the bee-keeper should possess a certain amount of aptitude for the pursuit, and must acquire the ability to handle bees judiciously and well under all imaginable conditions. When alarmed, bees instinctively begin to fill their honey-sacs with food from the nearest store-cells and when so provided they are more amenable to interference. The bee-keeper, making use of this fact, blows a little smoke from smouldering fuel into the hive by means of an appliance known as a bee-smoker, alarms the bees and is thus able to manipulate the frames of comb with ease. The "Bingham" type of smoker (fig. 14) is the one most generally used. No other protection is needed beyond a bee-veil of fine black net, slipped over a wide-brimmed straw hat to protect the face

from stings when working among bees. As the great majority of apiaries owned by British bee-keepers are situated in close proximity to neighbours, quietness and the exercise of care when manipulating are essential. The bee-keeper should carefully select the particular type of hive most suited to his means and requirements. This point settled, uniformity is secured, and all loose parts of the hives being interchangeable time will be saved during the busy season. Beginning with not too many stocks, and adopting the wise adage "make haste slowly" the knowledge gained will enable him to select such appliances as are suited to his needs.

Bee-keeping for Profit.—As a rule, it may be said that the man content to start with an apiary of moderate size may realize a fair profit. At the same time it is but fair to say that bee-culture in the United Kingdom, if limited to honey-production alone, is not always safe for entire reliance to be placed on it for obtaining a livelihood, but combined with fruit growing, poultry keeping, etc., it will usually give a fair profit. The main honey-gathering time lasts only about six or seven weeks. As the season advances and the flowers yield nectar more freely, the combs in the brood chamber become crowded with bees, and the cells that should be available for brood rearing are filled with honey unless adequate room is provided. In a short time the congestion may become so acute that in the evening, when all the foraging bees have returned, the hive will not accommodate them, and there is no choice under such poor management, but for a large proportion, including a number of drones and the old queen, to emigrate or "swarm." Preparations for this will have been made by the bees beforehand, a young queen having been reared in readiness to take the place of the old one, and she will leave her cradle soon after the swarm has gone. When the bee-keeper notices the hive showing signs of overcrowding, and before the bees have commenced preparations for swarming, he gives them room for expansion by super adding what are termed "supers," that is additional layers or working compartments above fitted with either sections or frames of comb with comb foundation or drawn combs. Some bee-keepers place a queen excluder over the brood chamber, which is said to lessen the chances of undesired swarms, but this actually tends to increase swarming. A queen excluder is a piece of apparatus in which are oblong perforations of such a width that the worker-bees can just pass through but the queen is unable to do so; therefore no brood can be reared in those combs to which she has not access and from which the surplus honey is taken.

Diseases of Bees.—It is quite natural that bees living in colonies should be subject to diseases, and only since the introduction of movable-comb hives has it been possible to learn something about these ailments. One of the most serious troubles with which the bee-keeper has to contend are the two diseases commonly known as foul brood, so called because of the young brood dying and rotting in the cells. This abnormal condition has been known from the earliest ages. Schirach mentioned and described one disease in 1769, and was the first to give it the name of "foul brood." Still later, in 1874, Dr. Cohn, after the most exhaustive experiments and bacteriological research, realized that the disease was caused by a bacillus, and later the name *Bacillus pluton* was given to it. Cheyne and Cheshire declared that the European foul brood was caused by the *Bacillus alvei*, but this is now known to be the result of the *B. pluton*. The best available information indicates that *B. alvei* is a non-pathogenic organism. Lochhead asserts that *B. pluton* may be a morphological form of *B. alvei*. Even though this is proved to be true, *B. alvei*, known to Cheyne and Cheshire, could not have caused any disease, for in its usual form it has repeatedly been fed to healthy colonies and produces no disease whatever. In the typical *alvei* form it is strictly a decay-

FROM CHESHIRE, "BEES AND BEE-KEEPING"
FIG. 12.—THE HONEY BEE

producing organism. Another distinct disease is that known as the American foul brood which is caused by *Bacillus larvae*, described by White. The illustration (fig 15) shows a portion of comb affected with one of these diseases. The sealed cells are dark-coloured and sunken, pierced with irregular holes, and the larvae are found in all stages from the crescent-shaped healthy condition to that in which the dead larvae are seen lying at the bottom of the cells, flaccid and shapeless. The remains begin to decompose, change to buff colour, afterwards turning brown; in American foul brood the mass becomes sticky and ropy in character, making its removal impossible by the bees. In course of time it dries up, leaving nothing but a brown scale adhering to the bottom side of the cell. In the case of American foul brood the larvae die after the cells are sealed over; a strong characteristic and offensive odour is developed in some phases of the disease, noticeable at times some distance away from the hive. These two forms of foul brood, European and American, have long been known.

When healthy the brood of bees lies in the combs in compact masses, the larvae being plump, of a pearly whiteness, and when quite young curled up on their sides at the base of the cells. When first attacked by European foul brood the larva moves uneasily, assumes an irregular position in the cell, and finally becomes loose and flabby, an appearance which plainly indicates death. When the disease attacks the larvae before they are sealed over *B. pluton* is present. Various other microbes also present in large numbers are not believed to be pathogenic or disease-producing in character. It is therefore seen that a number of micro-organisms play an important part in the same disease. The danger of contagion lies in the wonderful vitality of the spores of *B. larvae* and their great resistance to heat and cold. Dr. Maassen records a case where he had no difficulty in obtaining cultures from spores removed from combs after being kept dry for 20 years.

The adult bee is also liable to several minor diseases, including Acarine disease, Nosema disease and dysentery. In all these diseases the symptoms that may be seen by the bee-keeper are similar in many respects, though dissection of the bee and an examination under a microscope usually afford the only certain means of determining from which disease it is suffering, and also of detecting disease in its early stages. The principal outward symptoms are the habit of crawling in place of flying, dislocated wings and distended abdomens. Diseased bees on leaving the hive are unable to fly, and an attempt to take flight from the hive

entrance results in the bee falling to the ground where it crawls about, making its way when possible to the top of stems of grass, etc., in an endeavour to obtain an elevated position from which it may make another attempt to fly. In bad cases, especially of Acarine disease, the ground may be so covered with crawling bees that it is impossible to put the foot down without crushing a number of them. Towards evening they tend to collect in clusters, and perish from exposure during the night. When crawling occurs the disease is in an advanced stage. Dysentery manifests itself also by the soiling of

This comb contains cells for queens, drones and workers. Larvae are shown in different stages of metamorphosis from grub to perfect insect

the combs, and the inside of the hive, a thing which never occurs when the bees are in good health. Dysentery is most likely to break out when the bees have been confined to the hive for prolonged periods during the winter, especially if the food stored in the combs is unsuitable, or has fermented. It may be guarded against by making certain that the food stored for winter use is all sealed over in the early autumn, the hives are well ventilated, the bees warmly covered, and kept dry.

BEE CULTURE IN AMERICA

The movable-frame hive was invented by the Rev. L. L. Langstroth at Philadelphia in 1852 and immediately introduced by him to bee-keepers of the United States. The hive which he devised after his long experience with bees contained ten frames each $17\frac{1}{8} \times 9\frac{1}{2}$ in. in size, but the frame which now carries the name Langstroth and which is standard in America is $17\frac{1}{8}$ in. long. Other hives of similar design but of different dimensions are used throughout the world and all have essential features of the Langstroth hive.

Bee-keeping has within recent years been greatly developed in the United States and Canada. Previous to 1906, the adulteration of extracted honey by dishonest dealers was prevalent in the United States, there being no adequate law to prevent it. On June 30 of that year the Food and Drugs Act was passed by Congress, and since that time very few cases of adulteration have been detected. Before this protection was available to the bee-keeper, it was virtually necessary for him to produce his crop in sections or comb-honey which cannot be adulterated, in order thus to ensure the purity of his product to the consumer. Since the passage of the law, many bee-keepers have changed their methods to those which enable them to produce extracted honey. As a result, the individual bee-keeper can now manage several apiaries. Swarm control, which is so vitally necessary to modern bee-keeping, is much more easily accomplished with extracted honey production in out-apiaries.

This change within the past 20 years has resulted in the placing of much emphasis on equipment suitable for extensive bee-keeping operations. Extractors are now made which remove the honey from 45 frames at once, honey pumps and other equipment for the rapid handling of honey have also been perfected, and it is safe to say that the chief advances along practical lines of the past few years have been those pertaining to apparatus rather than to bee-keeping methods.

Formerly most of the bee-keepers manufactured their own hives and other equipment; now large manufacturing concerns make and deliver hives to the bee-keeper more cheaply than he can make them for himself. The three large American companies carrying on work of this kind are more extensive than those found in any other country at present. Some bee-keepers spend their winter months in preparing hives for their own use but buy other equipment from the factories.

Commercial bee-keeping is not practised in all parts of the United States, since many parts of the country are unsuited to extensive operations. The chief commercial regions are those parts of the north-eastern States where the lime content of the soil is adequate to cause the clovers to secrete nectar freely, the irrigated regions of the inter-mountain States where alfalfa (lucerne) is the chief nectar source, and the sage region of southern California. In limited areas in other parts of the country there are bee-keepers operating considerable numbers of out-apiaries, but in most of the sections other than those specified the bee-keepers operate single apiaries. The features which make certain regions suitable for out-apiary management are, first, that the main honey-flow (time of heavy secretion of nectar) shall come just when the colony population reaches its maximum in early summer and, secondly, that relatively simple methods of swarm control shall be applicable to the swarming tendencies of the bees of the region.

The production of honey for the United States cannot be stated

FIG. 14.—THE BINGHAM BEE-SMOKER

This is used generally by bee-keepers in England and the United States when manipulating the frames of comb in the hive

definitely, but it is conservatively estimated that there are between 800,000 and 1,000,000 persons owning bees in the country. The average number of colonies per bee-keeper is perhaps not over ten, which means that in the non-commercial sections of the country there are large numbers of small holders. The aggregate honey-crop is considerable and is valued at about \$75,000,000 per annum. The bees-wax crop is relatively small because of the methods of bee-keeping practised. Since the country does not produce enough even for the manufacture of comb-foundation for use of bee-keepers themselves, it is necessary to import considerable quantities of wax from other countries.

During the period of the World War, the wholesale markets for honey were greatly developed, since considerable quantities of American honey then went to the Allied countries. Since that time, however, some wholesale dealers have ceased to handle honey and there has been increasing difficulty in selling honey in large quantities. The ensuing increase in local marketing has resulted in the sale of 65% of the honey-crop through markets other than those of the large cities—in an unbalanced distribution of the honey-crop, since over 50% of the population is urban. Extensive advertising of honey has been found unprofitable wherever tried, but the future development will probably be in bringing honey to the attention of the city consumer by some means. There are several extensive co-operative marketing organizations in the chief commercial centres, but the honey of the non-commercial areas will probably continue to be sold locally.

Methods for handling honey in large quantities after extracting have also been developed. Storage after extracting is usually in large tanks until the honey is placed in 60lb. cans for wholesale shipments. Barrels are rarely used. When honey from various plant sources is to be blended, as is commonly done by extensive bottlers, the various honeys are first liquefied by heating and then placed together in a large tank and stirred slowly. The temperature is maintained at about $135-140^{\circ}$ F for some hours until every crystal is dissolved, after which the honey is brought quickly to 160° but no higher, and bottled at once. Tanks lined with enamel are in common use for blending. Bottles are filled as full as possible and sealed hermetically while hot to retard crystallization of the honey. In blending it is a common practice to add some sage or tupelo honey as these rarely granulate and serve to retard granulation of the blends.

The use of colonies of bees for the cross-pollination of fruits has greatly increased within recent years and many extensive orchardists arrange with commercial bee-keepers to move truckloads of bees to the orchards for the period of bloom, after which they are removed. The incorrect spraying of fruit trees for the control of insect pests has resulted in some losses to bee-keepers, but the worst situation is brought about by the application of dusts as insecticides or fungicides, which float for some distance from the orchard and fall on other flowers in full bloom. Incorrect spraying is prohibited by law in some States but there are so far no laws regarding application of dusts.

The outstanding improvements in bee-keeping management recently made in the United States are those dealing with methods of wintering, disease control, swarm control and the proper placing of storage space in the colonies. Queen-rearing methods are also well developed. The greatest source of loss to American bee-keeping is that which comes from improper methods of wintering, which loss now averages about 12% of all colonies annually. These losses are no higher in the extreme northern States than in those of the middle latitudes, indicating that severe cold alone is not the cause of the loss. Methods have been devised which if put into operation would reduce this loss to a small fraction of that which now occurs and these methods are spreading. In disease control the greatest advance has been in the control of Euro-

pean foul brood by methods which pertain only to strengthening of the colonies at the time when this disease makes its attack. The losses from poor wintering and uncontrolled swarming would have wrecked bee-keeping in many parts of the country but for the spread of knowledge of better methods making it possible to keep bees with profit in all the habitable regions.

Beginning in 1916, extension work in bee-keeping was inaugurated by the Federal bureau of entomology and has since been taken over by the several States, the Federal Government now taking no part in this work. This brings better methods of bee-keeping directly to those actually engaged in the industry. Beginning a few years earlier, the teaching of bee-keeping has been developed until now this subject is taught in over half of the agricultural colleges. The bureau of entomology maintains a research laboratory for bee-keeping near Washington with a branch laboratory in the West. Several of the State universities are also supporting research work in this field. Clubs for boys and girls in bee-keeping are maintained in several States.

The investigations conducted in the United States in recent years which have had the greatest influence in the development of bee-keeping are those pertaining to the causes of the bee diseases, especially those of the brood of bees, the behaviour of bees during the winter when they rear no brood, the flight activities of bees, the behaviour of bees in gathering and storing nectar and in ripening it to honey, the rate of brood-rearing, the causes of swarming, the control of European foul brood by preventive measures, the disinfection of combs infected with the causal organism of American foul brood, the structure and development of the honey-bee, the utilization of various carbohydrates by adult and larval bees, the distribution of European foul brood in relation to the environment, and the colour composition and colour grading of extracted honey. Details of all these lines of investigation are contained in publications of the Federal department of agriculture, where most of the work has been done. Research problems of the State, experiment stations in this field have been chiefly elaborations of problems handled by the Federal laboratory. (E. F. PH.)

BEE LINE HIGHWAY, a thoroughfare connecting Kansas City, Mo., with Canon City, Colo. It is the shortest route between these two points. Graded and improved throughout most of its 675m., it crosses the flat, rolling plains of Kansas to the San Isabel National Forest at the foot of the Rocky mountains, passing through Ottawa, Council Grove, Lindsborg, La Crosse, Eads and Pueblo.

BEELZEBUB, **BEELZEBUL**, **BAALZEBUB**. Baalzebub was the name of the god of the Philistine city Ekron, to whom Ahaziah of Israel when sick sent to inquire whether he should recover (II Ki. i. 1-18). The meaning of the name is obscure. Baal (*q v.*) the common title for a Semitic deity, especially a local deity, is often found compounded with the name of the city where the deity was worshipped: cf. place-names such as Baal Hazor (II Sam. xiii. 23), Baal Hermon (Judges iii. 3), probably contracted from a fuller form Beth Baal X=Temple of the deity of X, as in Beth Baal Meon (Josh. xiii. 17). But as no place Zebub is known, and the Baal of Zebub would in any case hardly be god of Ekron, such an explanation of Baalzebub is improbable. *Zebub* is found as a noun=fly (Isa. vii. 18, Eccles. x. 1), and the most probable explanation of Baalzebub is that it means "God of flies," i.e., the god who can bring or send away flies. Pliny records in his *Natural History* that the inhabitants of Elis in time of pestilence cried to "the Disperser of Flies," and that as soon as sacrifice was offered to the deity the flies perished and the pestilence ceased. The epithet "Disperser of Flies" is attached in Greek literature to the names of Zeus and Hercules. Flies, like mice, were in ancient times recognized as bringers of disease, and it seems quite likely that a god who was able to drive away flies should be regarded as one who had power over disease: the fame of such a god in Ekron would doubtless be known to Ahaziah. Barton says that flies are still specially prevalent about Ekron (*A Year's Wanderings in Bible Lands*, pp. 216 seq.).

The form Beelzebub, found in the English New Testament (Matt. x. 25, xii. 24, 27; Mark iii. 22; Luke xi. 15:18 seq.) is due to the influence of the Vulgate: the Greek form is *βεεζεβοὺλ* or *βεελζεβοὺλ*. If the latter is accepted it has been explained as equivalent to the Rabbinic *בְּעֵל זְבֻל* (*bē'el zēbūl*)=Lord of the Dwelling, i.e., of the region in which demons dwell. But the Rabbinic *בְּעֵל זְבֻל* (*zēbūl*) is used only of the heavenly or earthly temple of God, which makes such an interpretation very unlikely. More probably, though not certainly, the name is really to be identified with the Old Testament Baalzebub, the final *b* having been corrupted to *l*, as Bab-el-Mandeb in popular speech becomes Bab-el-Mandel. As a god of healing Baalzebub may well have been supposed to have power over demons, since in Semitic thought diseases were regarded as inflicted by demons (*see* Strack and Billerbeck, *Das Evangelium nach Matthäus*, pp. 631 sqq.). (W. L. W.)

BEER, a beverage made by the alcoholic fermentation of crushed cereal, is of great antiquity throughout the greater part of the world. According to Dr. E. Huber (*Bier und Bierbereitung bei den Völkern der Urzeit*, 1926) the scanty records of ancient Babylon going back to 5000-6000 B.C. show that beer made from barley, and from barley and spelt, was extensively drunk there, even by labourers and by women in the harem. Important as it was in Babylonian times, beer played an even greater rôle in daily life in Egypt until the fall of Egyptian civilization and the rise of Mohammedanism. It was used in medicine in Babylon and Egypt, and had spices and bittering substances added to it—a hint of hops to come. With regard to its manufacture, from the examinations of the reliefs from ten graves Dr. Huber has pieced together 23 scenes giving a fairly complete idea of the brewing processes employed. It is particularly noticeable how the initial part of the process is like bread-making, the crushing of the cereal, the making of dough and the baking of this before cutting it up and making an infusion. Bread and beer have in fact always been closely connected, and in mediaeval times the brewery and bakery were always side by side in the big monasteries. The knowledge gained from these inscriptions has been confirmed by Herodotus, Pliny and others in many references to the brewing of "wine" from barley.

In Abyssinia and Nubia, Herodotus and Strabo both wrote that the people lived on millet and barley "whereof they also made a beverage." There is a beer made from germinated millet by the Langonassis in the Congo (Eporsoz, *Au Soudan Français*). In the south, the Kaffirs have made beer, according to their own account, from time immemorial just as they do at present. Dr. Loir has given a long account of it; it appears that the maize or millet is steeped in water for 24 hours; it is then packed in bags or blankets, hot stones being used in winter time to keep these warm; the grain germinates in 48 hours and is then dried by the sun; this is a crude but very definite form of malting. This malt is mashed with raw grain, slowly brought to the boil; allowed to cool in the open, when fermentation starts, due to access of air-borne and insect-borne yeast. In China, also, there are records of intoxicating beverages made from millet several centuries B.C.; but in that country and Japan there has from ancient times been a preference for the use of rice for making fermented beverages (*see* SAKÉ).

Records of fermented cereal beverages among classical writers include many countries, e.g., Thracia, Illyria, Pannonia, besides northern Europe and the British Isles. The Greeks learnt the art of brewing from the Egyptians, but beer was generally held in contempt in wine-drinking countries. With regard to our knowledge of the less civilized districts of northern Europe, we are mainly dependent on classical writers; Tacitus said that beer was the usual drink of the Germans and Pliny mentions the use of it in Gaul and Spain; he also writes "They employ the foam which thickens upon the surface as a leaven"—probably the first reference to beer yeast for baking purposes.

"Strong" and "Small."—The strength of beer must always have varied a good deal, for the first strainings from the mash would be strong and the later washings weak and when these were not mixed there would be at least two kinds of beer, "strong"

and "small" beer. Later on, in the 14th century, the terms used were "better" beer and "penny" ale, the former costing 4d. a gallon and the latter 1d. a gallon. According to Bateson (*Medieval England*), when Dover was provisioned against siege, 260 quarters of malt were sent in as being sufficient to brew 520 gallons a day for 40 days. This works out at a very strong beer of about 1100 specific gravity, assuming the quarter was the same as the Imperial quarter of to-day. But in another case in A.D. 1458 when the Hansa towns were sending beer to their troops the specific gravity worked out at about 1056, practically the same as the gravity of a standard barrel in England to-day. The ale of the middle ages must have been of fair quality as we read that Gluttony in the "Vision of Piers Plowman" when lured into an ale-house going to confession got drunk on a gallon and a gill.

Brewing at Monasteries.—All monasteries, even strict Dominicans, had their brewhouse and Netley could count as many as four brewers among its servants. In 1349, we read of the duke of Lancaster endowing two recluses and their two waiting women with eight gallons of "better" beer per week. Brewing owes a good deal to the cleanliness of the monks and the large scale of their brewing.

The Use of Hops.—As from ancient times it was the custom to add spices and herbs to beer, the use of hops at the start was merely the introduction of a new kind of herb. The original objection to the use of hops in Germany in the 14th century was that they interfered with a monopoly exercised by certain authorities in the sale of *gruit* for making beer. This was a mixture of herbs which included sweet gale or bog-myrtle, marsh or wild rosemary, and milfoil or yarrow; it was also said to contain other ingredients about which there is dispute. In April 1381 Archbishop Frederick of Cologne, on behalf of the *gruit* monopoly, issued a decree according to which not only brewers, but the clergy, the military and civilians were commanded to buy their *gruit* in the episcopal *gruit*-houses and the importation of "hopped" beer from Westphalia was prohibited. Ling or heather has also been recorded as used in beer from early times.

Ale and Beer.—There appears to have been a distinction between ale brewers and beer brewers in the 15th century. In 1464, the London brewers petitioned the Lord Mayor and Aldermen to establish regulations for their craft as they had no rules "to the detriment of the citizens as regards correct measure of barell kilderkyns and firkyngs, and in hoppes and other greynes the which to the said mistere apperteynen." This is evidence of the customary use of hops in beer then. But later in 1483 the ale brewers petitioned the Lord Mayor to forbid the putting into ale of any "hops, herbs or any other like thing but only licour, malte and yeste" From that time on water, malt and ale yeast were the prescribed standards for this product and only the beer brewer was allowed to use hops. There was no prohibition as to the use of hops except for the brewing of ale. As hops were almost universally employed 100 years later, either they were permitted in ale, or beer only was drunk, in which case ale is a misnomer for beer. In certain districts there are at present some curious distinctions between the two terms; in some parts of London if beer is asked for, porter is served; on the other hand, in the West country, strong vatted ale used to be called beer.

There appears to have been a distinction between ale and beer in the matter of price; for in 1418, when Henry V. was lying with his army before Rouen, the government of the City of London ordered "that the brewers of the ale that was presented to our lord the King at the siege of the city of Roan should have for every tun of 200 tuns 30s. . . . and that brewers of beer should have 13s 4d. for every tun of 300 tuns" (H. T. Riley, *Memorials of London Life*, 1868). The actual size of the tun of that time is not known, but it must have been bigger than that of the Hansa towns which ran from 38 to 45 gallons only.

Even at the end of the 18th century strong beer was sold at 30s a barrel and small beer at 8s, a ratio similar to the old 4d. and 1d a gallon. At this time separate duties were charged upon strong and weak beer and disputes were common between Excise officers and brewers as to which worts were chargeable with "strong" and which with "small" beer duty, so an Act of Parlia-

ment was passed compelling the brewer to brew table beer by itself, "that the officer may not be puzzled in applying his only means of discrimination, consisting in dipping his fingers into the wort, tasting it, etc." What the "etc." was we do not know. It was about this time that Richardson constructed the first brewer's saccharometer and suggested that its use in determining specific gravity would prevent these altercations.

Specific Gravity.—In the United Kingdom specific gravity is the weight of a volume of liquid referred to water as 1000. In France and Belgium water is taken as unity and the degrees of gravity reckoned from the second place of decimals. Thus a specific gravity of 1040 is called 40 degrees by us and 4 degrees by the French and Belgians. In Germany, Italy and elsewhere Balling degrees are used, one Balling degree equally 4.04 specific gravity degrees, so that the 1040 above would be 10 degrees Balling. The advantage of Balling degrees is that they roughly represent the percentage of extractives in solution.

Taxation.—Since beer was used for rent and as tribute to the overlord before the introduction of money it was a simple transition to tax its production when money came into general use and it has been the subject of taxation in one form or another in many countries for numbers of years.

The first duty on beer in the United Kingdom was imposed in the reign of Charles II., a distinction being made between strong beer and weak beer. This continued with occasional increases until the repeal of beer duty in 1830. A duty on malt was first imposed in 1697 and from that date until 1830 both beer duty and malt duty were charged. After the repeal of the beer duty the malt duty was greatly increased. A hop duty was in existence between 1711 and 1862, when it was abolished owing to the very wide fluctuation in return.

Sugar was permitted in brewing in 1847 and in 1850 the first sugar tax was imposed. It varied from 1s.4d to 6s 6d until 1874 when the general duty on sugar was repealed but that on sugar used for brewing was raised to 11s 6d. at which it remained until 1880 when the Free Mash Tun Act was introduced. By this Act the duty was taken off the materials and placed on the wort; i.e., the beer before fermentation according to its specific gravity. At first the rate was 6s.3d. a barrel at a specific gravity of 1057; the bulk at "standard" gravity on which the charge was made was calculated from the bulk and gravity of worts as ascertained at collection with an allowance of 6% for "waste." In 1889 the standard gravity was reduced to 1055 at which it remains to-day. In 1894 a further 6d. per barrel was added and in 1900 1s. making 7s.9d. per standard barrel, at which it remained till war broke out in 1914. During the war it was rapidly increased to 100s. a barrel. The rate of duty in 1928 is 100s a barrel of 1055 specific gravity, the amount altering in proportion to the gravity, with a rebate of 20s. a barrel of whatever strength down to 1024. If the brewer does not get four standard barrels per quarter he is charged duty on the materials instead of on the wort.

COMPOSITION

Beer is composed of extractive matters (consisting of carbohydrates, proteids, and flavouring substances derived from hops), alcohol and water, and typical analyses in respect of these ingredients are as follows:—

Class.	Original gravity.	Beer gravity.	Alcohol per cent by weight.	Extractives.
Strong ale	1080	1028	5.15	0.6
Best bottled pale ale	1055	1010	4.44	4.24
Draught pale ale	1048	1011	3.71	4.10
Light bitter	1040	1007	3.28	3.06
Mild ales { from	1046	1011	3.45	4.44
{ to	1032	1006	2.58	2.80
Strong stout	1060	1019	4.08	7.00
Porter	1046	1014	3.2	5.01

Stronger ale and stout of even higher gravity than 1080 is still brewed but in small quantities only.

The proportion of alcohol and extractives depends on the extent to which the beer has been fermented; the lower the degree

of gravity, the lower the extractives and the higher the alcohol. Both extractives and alcohol have a food value, the protein of the former which averages about 0.3% being especially valuable. But the mineral matters in the beer derived from the malt are not negligible; they contain a large percentage of potassium phosphate which is of service in the human economy. It has been found for instance that with operatives working at furnaces, water is unsuitable and weak beer is necessary for supplying the salts etc. which the perspiration has removed. In addition the hop resin has been found to favour the flow of bile and thus make for increased digestive energy.

Statistics: United Kingdom.—In 1914 when the duty was 7s. 9d. per barrel, the total came to £13,622,971 for 37,558,767 bulk barrels of an average gravity of 1052.8; these figures include over 2,000,000 barrels from what is now the Irish Free State. During the last three years ending March 31, 1927, the figures, excluding the Irish Free State, were as follows:—

	Duty	Bulk Barrels	Average Specific Gravity
1925	£75,825,827	26,724,825	1043.12
1926	£76,320,021	26,765,610	1043.23
1927	£78,763,480	25,100,461	1043.28

In 1927, the increase in the amount of duty on a decreased trade was due to the Government reducing the three month's credit allowed for payment of duty.

The import and export of beer varied very slightly in pre-war times, the former being about 50,000 barrels, the latter about 500,000. With the inauguration of the Irish Free State the imports have naturally greatly increased and in 1927 they amounted to 1,349,515 barrels. The export for the three years 1925-27 was 286,230; 302,892; and 294,874 barrels respectively.

Continental Beers.—The great majority of beers brewed on the Continent of Europe are of what is commonly called the Lager type. In their production a decoction mash is usually employed instead of the infusion mash process used for English beers.

In the decoction mash, the malt is mashed with cold or warm water (90° to 110°) and afterwards raised in temperature by two or three stages to 165° or 175°, at each stage by boiling a portion of the mash in a separate mash kettle and returning the boiled mash to the mash-tun.

There is an essential difference in the fermentation processes in these two brewing systems. In English beer (top fermentation) a variety of yeast is employed which comes to the top of the beer after fermentation. In lager beer (bottom fermentation) the yeast settles to the bottom of the fermenting vessels. Lager beer is also fermented at a much lower temperature (40° to 55°) and rather more slowly. Lager beer is finally stored for periods varying from two or three weeks to three to six months in large "lager casks" or tanks, in cellars cooled to little above the freezing point of water. During this period of maturation, it spontaneously brightens and becomes highly charged with carbon dioxide. From the lager cellar it is racked through a filter to casks or to tanks for bottling. It is sold direct from the cask or in bottle, and served at a low temperature (45°) on ice.

There are several well-known varieties of lager beer, generally distinguished by the names of the towns in which the types became famous. The names have come to designate types rather than places of origin. Of these the Pilsener or Bohemian beer is pale, with a pronounced hop aroma and flavour. The Munich or Bavarian type is dark brown, with a full sweet malt flavour and no very pronounced taste of the hop. The Vienna beer has a less decided character than either of these, and lies between them in both colour and taste. The Dortmund beer is pale, with a not very marked hop or malt flavour. In addition to the lager beers, top fermentation and mixed fermentation beers are brewed on the Continent of Europe to a certain extent, especially in Northern France and Belgium where since the war the proportion of lager beer has, however, greatly increased. There are also several special kinds of beer peculiar to definite localities, such as the top fermentation Weiss Bier of Berlin. In this, wheat malt is used as well as barley malt, and the beer is characterized by

acidity. In Belgium, Lambic and Faro beers are still brewed to some extent, the Lambic being stronger than the Faro; both are characterized by their acidity and are produced by spontaneous fermentation.

Lager beer is brewed at various gravities, and these correspond very closely to those of English mild and bitter beers. The strength (corresponding to the amount of material used per barrel or hectolitre) is expressed in Germany and most other countries in degrees Balling, 1 degree Balling being approximately equivalent to 4 degrees specific gravity (1.004). In France and Belgium, a degree equivalent to 10 British degrees of gravity is employed, 11 to 12.5 degrees Balling (1044 to 1050 sp. grav.) represents a high class lager beer. The percentage of alcohol in lager beer is usually slightly less than in a top fermentation beer of equal gravity and the hop content is also smaller. Owing to the fermentation and storage at low temperatures, lager beers usually carry a better head than ales.

On the Continent of Europe, as in England, there has been a greatly increased production of bottled beer since 1918, especially of bottled beer of a lighter gravity than of old. Motor transport has made bottled beer obtainable in many places where previously the local wine was the only beverage. The increase in bottled beer is particularly noticeable in the large breweries of Copenhagen, where it now amounts to 98% of the total output. For export, bottled beer is usually pasteurized, as it is in many places for local consumption also. See also BREWING; ALE.

(H. L. H.; C. A. W.)

BEERBOHM, MAX (1872—), British caricaturist and writer, was born in London Aug. 24, 1872, a half-brother of Sir Herbert Beerbohm Tree, the actor. He was educated at Charterhouse and Merton college, Oxford. Before he had left Oxford, Beerbohm had made a reputation as an essayist of wit and polish, *The Yellow Book* offering him a congenial hospitality. This reputation was maintained, when he succeeded G. B. Shaw as dramatic critic to *The Saturday Review*, by the judiciously small amount of work which he published and its almost uniformly high accomplishment, in essays, fiction and parody alike. This includes *The Works of Max Beerbohm* (1896); *The Happy Hypocrite* (1897); *More* (1899); *Zuleika Dobson* (1911); *Seven Men* (1919); *And Even Now* (1920).

As a caricaturist, Beerbohm's fame followed a parallel line, and his skill as a draughtsman increased with the years. Among his published drawings are *Caricatures of Twenty-five Gentlemen* (1896); *The Poet's Corner* (1904); *Fifty Caricatures* (1913), *Seven Men* (1919); *A Survey* (1921); *Rossetti and His Circle* (1922), and *Observations* (1925). As a sophisticated commentary on the social and literary life of his time, Beerbohm's economical and often caustic drawings stand alone; his residence in Italy, at Rapallo, after 1910, gave him many advantages for the detached observation of personalities and tendencies, although once or twice it may have endangered his perspective; and he is certainly free from a certain fear of acid comment which has dimmed the art of caricature in England since the early Victorian age. (See CARICATURE.) (J. H. M.)

BEERSHEBA (Mod. BIR ES-SABA'), Simeonite town on the border line between the waste and the cultivated land and referred to frequently in the Bible as the southern limit of Palestine. A famous sanctuary, it was the scene of several theophanies. The digging of its well is attributed in Genesis to both Abraham and Isaac, and into the wilderness of Beersheba Hagar wandered forth with Ishmael. Here the two sons of Samuel exercised judgeship and Elijah sought refuge in its neighbourhood from the vengeance of Jezebel. In Roman times it was the metropolis of a flourishing district and the ruined sites of many a town can still be seen in the waste land to the south. An important inscription of the time of the Constantines found at Beersheba, gives a list of towns and the military dues from each. Later the city became an episcopal see. The name probably means "seven wells" in spite of efforts to prove otherwise. Three wells with evident marks of antiquity can be seen and four others are said to have been located. The outlines of the ancient town are still discernible and amongst them can be traced the foundations of a church

The modern town has an installation of water pumped from the largest well, the "well of Abraham," by an oil engine. During the attack on Egypt in the World War it was the headquarters of the Turkish army and the amenities of the town were greatly improved. The present population is about 2,000. Beersheba was captured by British troops on Oct. 31, 1917, a brilliant charge into the town by the Australian mounted division saving the wells from destruction by the Turks. The town is connected by rail with Rafa and has a British military cemetery.

Battle of Beersheba, Oct. 31, 1917.—The capture of Beersheba, which opened the way for the penetration of the Turkish front in Palestine, and ultimately to the capture of Jerusalem, is described under PALESTINE, OPERATIONS IN.

BEESLY, EDWARD SPENCER (1831-1915), English historian and positivist, son of the Rev. James Beesly, was born at Feckenham, Worcestershire, England, on Jan. 23 1831, and died at St. Leonards on July 7 1915. He was educated at Wadham college, Oxford, which may be regarded as the original centre of the English positivist movement. Richard Congreve was tutor at Wadham from 1849 to 1854, and three men of that time, Frederic Harrison (*q.v.*), Beesly and John Henry Bridges (1832-1906) became the leaders of Comtism in England. Beesly left Oxford in 1854 to become assistant-master at Marlborough college. In 1859 he was appointed professor of history at University college, London, and of Latin at Bedford college, London, in 1860. He resigned these appointments in 1889 and 1893 respectively, and in 1893 became the editor of the newly established *Positivist Review*. He collaborated in the translation of Comte's system of *Positive Polity* (4 vols., 1875-79), translated his *Discourse on the Positive Spirit* (1903), and wrote a biography of Comte for a translation of the first two chapters of his *Cours de philosophie positive*, entitled *Fundamental Principles of Positive Philosophy* (1905).

BEESWAX, a product of digestion secreted by the worker-bee for constructing the cell-walls of the honeycomb; it is estimated that about 10 lb. of honey are consumed for one pound of wax secreted. Beeswax is a yellowish solid of agreeable, somewhat honey-like odour and of a faint balsamic taste. It is insoluble in water, but soluble in carbon tetrachloride (warm ether dissolves beeswax, but it is not soluble in this solvent in the cold) and chloroform. The commercial value of beeswax for polishes is due to its texture. In early times it was preferred to tallow for candles on account of its higher melting point and freedom from smell. The modern use of beeswax for church candles is in accordance with religious ordinance, based on mystical considerations. European and some Japanese waxes are derived from the common bee, *Apis mellifica*, whereas the bulk of the African and Indian waxes are from other varieties, especially *Apis dorsata*. Large quantities are exported from East Africa, South America and the West Indies, and considerable quantities are produced in the United States.

After removal of the honey by draining or by means of a centrifuge, the combs are melted in hot water and the wax strained from gross impurities (dead bees, cocoons, etc.); the residue is pressed to obtain more wax. In large-scale operation the melted honeycombs are expressed in a hydraulic press. The press-residues are boiled up with water and re-pressed. The cake still contains about 10% of wax, which is recovered by extraction with a volatile solvent; such "extracted wax" is darker and of lower quality than that obtained by expression.

Beeswax varies in colour from golden yellow to almost black, depending on the care used in its preparation and also on the age and food of the bees. To preserve the quality and colour, beeswax must always be melted in water and never by direct heat. For some purposes the wax must be bleached; the most satisfactory method is to expose the wax in the form of thin films to the action of moist air and sunlight. The addition of a little oil of turpentine accelerates the process. Ozone may be used, but bleaching by chemical oxidizers, such as chlorine, etc., is less satisfactory, as the product is unsuitable for many purposes (*e.g.*, candles).

Beeswax consists chiefly of free cerotic acid and myricin

(myricyl palmitate), with small quantities of other higher fatty acids and alcohols, and about 10% of hydrocarbons. East Indian (Ghedda) wax, like most waxes from the Far East, exhibits marked analytical differences from that of European origin.

Beeswax, besides being used for church ceremonial candles, is also employed in the manufacture of wax polishes, ointments, encaustic paints, lithographic inks, modelling wax, etc.

(E. L.; G. H. W.)

BEET, a cultivated form of the plant *Beta vulgaris* var. *maritima* (family Chenopodiaceae), which grows wild on the coasts of Europe, North Africa and Asia as far as India. It is a biennial, producing, like the carrot, a thick, fleshy tap-root during the first year and a branched, leafy, flowering stem in the following season. The small, green flowers are borne in clusters. A considerable number of varieties are cultivated for use on account of their large fleshy roots, under the names of mangel-wurzel or mangold, field-beet and garden-beet. The cultivation of beet in relation to the production of sugar, for which purpose certain varieties of beet stand next in importance to the sugar cane, is dealt with under SUGAR. The garden-beet has been cultivated from very remote times as a salad plant, and for general use as a table vegetable. It has swollen carrot-shaped or turnip-like roots, the "flesh" of which is deep red but with light coloured zones. It is boiled, then cut into slices and eaten hot or cold; and it is also prepared as a pickle, as well as in various other forms. Beet is in much more common use on the continent of Europe as a culinary vegetable than in Great Britain, where it has, however, been cultivated for upwards of two centuries. The white beet, *Beta vulgaris* var. *Cicla*, is cultivated for the leaves, which are used as spinach. The midribs and stalks of the leaves are also stewed and eaten as sea-kale, under the name of Swiss chard.

The beet prospers in a deep, rich, well prepared soil. If manure is required, it should be deposited at the bottom of the trench in preparing the ground. The seeds should be sown in drills 15 in. apart, in April or early in May, and the plants are afterwards to be thinned to about 8 in. apart in the lines, but not more, as moderate-sized roots are preferable; in the United States they are sown 3 to 4 in. apart. The plants should grow on till the end of October or later, but must be taken up before the frost can injure them. The roots must not be bruised and the leaves must be twisted off—not closely cut, as they are then liable to bleed. In the north the crop may be wholly taken up in autumn, and stored in a pit or cellar, beyond reach of frost. If it is desired to have fresh roots early, the seeds should be sown at the end of February or beginning of March; and if a succession is required, a few more may be sown by the end of March. (X)

Production of the Sugar-beet.—Beetroot, as it is commonly called, is largely grown as a vegetable, but commercially the sugar-beet is much the most important variety. This has been specialized by developing its sugar-content and is extensively cultivated for sugar production. Except in the United States, it is little cultivated elsewhere than in Europe. Before the War the production of beet sugar was almost as great as that of cane sugar, but it has been much reduced while that of the sugar-cane has increased and is now about three times as great.

For many years the introduction of sugar-beet cultivation in British agriculture has been advocated, and exhaustive experiments have proved that there is no natural difficulty in growing crops equal in every respect to those grown on the continent of Europe. The obstacles were the reluctance of farmers to grow the crop unless they were sure of a market, and the equal reluctance of capitalists to establish sugar factories unless they could be assured of a constant and sufficient supply of the raw material.

In 1912 a British factory was established at Cantley and about 4,000 acres of sugar-beet were grown for its supply. It was closed in 1919 but re-opened in the following year, when another factory was started at Kelham which closed in 1922 and was re-opened in 1923. In these circumstances there seemed to be little hope that the British sugar-beet industry could be permanently established and the Government was appealed to for assistance. The British Sugar (Subsidy) act was passed in 1925. This provided for the payment from the exchequer of a subsidy of 19s. 6d. per cwt. of

home-grown sugar, continuing on this basis for four years, being then reduced to 13s. for three years, and to 6s. 6d. for another three, after which it would cease. By the Finance act 1925 a substantial preference was also given to home-produced over imported sugar in the excise duties.

Under this stimulus sugar factories were rapidly erected in various districts and the acreage of sugar-beet increased. The following statement shows the development in each manufacturing season:

	1924-25.	1925-26.	1926-27.	1927-28.
Acres of sugar-beet	22,637	56,243	129,463	229,200
No. of factories	3	9	14	19
Tons of sugar-beet delivered	183,713	431,185	1,117,072	2,000,000
Tons of sugar produced	23,015	51,783	153,487	260,000
Tons of molasses produced	5,701	13,545	37,500	65,000

It was hoped that the introduction of sugar-beet into British agriculture would not only be profitable to the growers but would also increase, or at least maintain, the area of arable land and provide more employment on the land. The results so far have been somewhat disappointing in view of the expenditure of public money involved. The total amount payable under the act is dependent on the total quantity of sugar produced during the term of the subsidy, but it was stated in the House of Commons that by the end of the financial year 1927-28 approximately £9,000,000 would be expended. The decline of the arable area has not been checked, but there has been some increase in employment. The cultivation of the crop necessitates a large amount of labour. An examination of the costs on a number of farms showed that the payment for labour amounted to from £12 to £14 per acre, while after the delivery of the beets the factories employed a considerable number of men during the manufacturing season. Work, however, both on the land and in the factory, is seasonal, and it is therefore difficult to trace any increase in the number of labourers permanently employed on the land (R. H. R.)

BEETHOVEN, LUDWIG VAN (1770-1827), German musical composer, was baptized (probably, as was usual, the day after birth) on Dec. 17, 1770, at Bonn.

Parentage and Childhood.—His family is traceable to a village near Louvain, in Belgium, in the 17th century. In 1650 a lineal ancestor of the composer settled in Antwerp. Beethoven's grandfather, who came to Bonn in 1732, and became one of the court musicians of the archbishop-elect of Cologne, was an amiable man whom Ludwig van Beethoven, though only four years old when his grandfather died, remembered with affection to the end of his life. Beethoven's father, a tenor singer at the archbishop-elect's court, was a bad-tempered man whose wage-earning capacity declined with his ability to keep sober. His wife, Magdalena Leym, or Laym—née Keverich, for this was her second marriage—was, like the court musicians, a domestic in electoral palaces. The example of Mozart suggested to Beethoven's father that his son might be profitable as a *Wunderkind*. He accordingly began to give him a severe musical training, especially on the violin, when he was only five years old, at about which time they left the house in which he was born (515 Bonngasse, now preserved as a Beethoven museum).

At nine years of age Beethoven entered upon a course of clavier lessons under a singer named Pfeiffer, and obtained a little general education from a certain Zambona. Van den Eeden, the court organist, and an old friend of his grandfather, taught him the organ and the pianoforte, with the result that in 1781 Van Eeden's successor, C. G. Neefe, was able to allow the boy to act occasionally as his deputy. With his permission Beethoven published in 1783 his earliest extant composition, a set of variations on a march by Dressler. The title-page states that they were written in 1780 "*par un jeune amateur Louis van Beethoven âgé de dix ans*" Beethoven's father could not make up his mind whether thus to antedate the compositions of his infant prodigy, or, as in the case of the three sonatas also written in 1783, to postdate his birth. Accordingly Beethoven for a long time believed that he was born in 1772, and the certificate of his baptism hardly

convinced him, because he knew that he had an elder brother named Ludwig who died in infancy.

In the year of these first compositions, 1783, Beethoven was given the post of cembalist in the Bonn theatre, and in 1784 his position of assistant to Neefe became official. In a *catalogue raisonné* of the archbishop-elect's court musicians we find "No. 14, Ludwig Beethoven" described as "of good capacity, still young, of good, quiet behaviour and poor," while his father (No. 8) "has a completely worn-out voice, has long been in service, is very poor, of fairly good behaviour, and married."

First Visit to Vienna.—In the spring of 1787 Beethoven paid a short visit to Vienna, where he astonished Mozart by his extemporizations and had a few lessons from him. How he was enabled to afford this visit is not clear. After three months the illness of his mother, to whom he was devoted, brought him back. She died in July, leaving a baby girl, one year old, who died in November. For five more years Beethoven remained at Bonn supporting his family, of which he had been since the age of 15 practically the head, as his father's bad habits steadily increased until in 1789 Ludwig was officially entrusted with his father's salary. He had already made several lifelong friends at Bonn, of whom the chief were Count Waldstein and Stephan Breuning; and his prospects brightened as the archbishop-elect, in imitation of his brother the Emperor Joseph II, enlarged the scale of his artistic munificence.

By 1792 the archbishop-elect's attention was thoroughly aroused to Beethoven's power, and he provided for Beethoven's second visit to Vienna. The introductions which he and Count Waldstein gave to Beethoven, the prefix "van" in Beethoven's name (which looked well though it was not really a title of nobility), and, above all, his astonishing playing and extemporization, quickly secured his footing with the exceptionally intelligent and musical aristocracy of Vienna, who to the end of his life treated him with genuine affection and respect, bearing with his rudeness and irascibility, not as with the eccentricities of a fashionable genius, but as with the agonies of a passionate and noble nature.

Biographical Sources.—Beethoven's life, though outwardly uneventful, was one of the most pathetic of tragedies. His character has had the same fascination for his biographers as it had for his friends, and there is probably hardly any great man in history of whom more is known and of whom so much of what is known is interesting. The interest which it arouses has led to voluminous controversy on various points; and on the identity of Beethoven's *Unsterbliche Geliebte*, Dr. Kalischer abuses Thayer in terms that rival the breeding of Bentley as his musical scholarship recalls the erudition of Boyle. On such dangerous ground encyclopaedists may excusably fear to tread.

The general lines of Beethoven's life are graphically traced, for English readers, in Grove's article thereon in the *Dictionary of Music and Musicians*; while the monumental biography of Thayer, who devoted his whole life to collecting materials, furnishes fuller information and deserves, it may be added, more mannerly treatment than it has received from those who find occasion to correct it. Thayer, rescuing Beethoven's character from the sentimental legends which had substituted melodrama for life, dealt unflinchingly with the facts, until the mass of grotesque and sometimes sordid detail only threw into clearer light the noble character and passionate zeal for the highest moral ideals throughout every distress and temptation to which a hasty and unpractical temper and the growing shadow of a terrible misfortune could expose a man.

Relations with Haydn.—The man is surpassed only by his works, for in them he had that mastery which was denied to him in what he himself calls his attempt to "grapple with fate." During his studies with Haydn some of the special difficulties that lay in his own character already showed themselves. Haydn, who seems to have heard of Beethoven on the latter's first visit to Vienna in 1787, passed through Bonn in July 1792, and was greatly impressed by his powers. It was probably at his instigation indeed that the archbishop sent Beethoven to Vienna to study under him. But Beethoven did not get on well with him, and

found him perfunctory in correcting his exercises. Haydn appreciated neither his manners nor the audacity of his compositions, and abandoned whatever intentions he may have had of taking Beethoven with him to England in 1794.

Beethoven could do without sympathy, but a grounding in strict counterpoint he felt to be a dire necessity; so he continued his studies with Albrechtsberger, a mere grammarian who had the poorest opinion of him, but who could, at all events, be depended on to attend to his work. The key to the situation is that Mozart had died at the age of 36, just at the time that Beethoven came to Vienna, and that Haydn was profoundly shocked by the untimely loss of the greatest musician he had ever known. At such a time Beethoven's tactlessness doubtless combined with his clumsy efforts at academic exercises to confirm Haydn in the belief that the sun had set for ever in the musical world, and prejudiced him against those bold features of style and form which the whole of his own artistic development had gone far to justify.

It is at least significant that those early works of Beethoven in which Mozart's influence is most evident, such as the septet, aroused Haydn's open admiration, whereas he hardly approved of compositions like the sonatas, op. 2 (dedicated to him), in which his own influence is stronger. Neither he nor Beethoven was articulate except in music, and it is impossible to tell what Haydn meant, or what Beethoven thought he meant, in advising him not to publish the last and finest of the three trios, op. 1. But whatever Haydn meant, he cannot have failed to contrast the achievements of Mozart, who after a miraculous boyhood had produced at the age of 25 some of the greatest music Haydn had ever seen, with the slow and painful development of his uncouth pupil, who at the same age had hardly a dozen presentable works to his credit. There is no evidence that Haydn ever came to understand Beethoven; and many years passed before Beethoven realized the greatness of the master whose teaching had so disappointed him.

Rising Fame and Popularity.—From the time Beethoven settled permanently in Vienna, which he was soon induced to do by the kindness of his aristocratic friends, the only noteworthy external features of his career are the productions of his compositions. In spite of the usual hostile criticisms of his music in respect of its obscurity, exaggeration and so forth, his reputation became world-wide and by degrees actually popular; nor did it ever decline, for as his later works became notorious for their supposed extravagance and unintelligibility his earlier works became better understood. He was no man of business, but he was incalculably suspicious and exacting in money matters, which in his later years frequently turned up in his conversation as a grievance, and at times, especially during the depreciation of the Austrian currency between 1808 and 1815, were a real anxiety to him. Nevertheless, under good management his external prosperity would have been great. He was always a personage of importance, as is testified by every anecdote, including the poorly attested tale of his cramming his hat tighter on his head to show Goethe how to put royalty in its place.

In 1814 it seemed as if the summit of his fame was reached when his 7th symphony was performed, together with a hastily written cantata, *Der glorreiche Augenblick* and the absurd fire-work entitled *Wellingtons Sieg oder die Schlacht bei Vittoria*, once popular in England as the "Battle Symphony." The occasion for this performance was the Congress of Vienna; and the Government placed the two halls of the Redouten-Saal at his disposal for two nights, while he himself was allowed to invite all the sovereigns of Europe. In the same year he received the freedom of the city, an honour much valued by him. After that time his immediate popularity, as far as new works were concerned, became less pronounced, as that of his easy-going contemporaries began to increase. Yet there was, not only in the emotional power of his earlier works, but also in the known cause of his increasing inability to appear in public, something that awakened the best popular sensibilities; and when his two greatest and most difficult works, the ninth symphony and parts of the *Missa Solennis*, were produced at a memorable concert in 1824, the storm of applause

was overwhelming, and the composer, who was on the platform in order to give the time to the conductor, had to be turned round by one of the singers in order to see it.

Deafness.—Signs of deafness had given Beethoven grave anxiety as early as 1798. For a long time it is known, he had successfully concealed it from all but his most intimate friends, while he consulted physicians and quacks with eagerness; but neither quackery nor the best skill of his time availed him, and it has been pointed out that the root of the evil lay deeper than could have been supposed during his lifetime. Although his constitution was magnificently strong and his health was preserved by his passion for outdoor life, a post-mortem examination revealed a very complicated state of disorder, evidently dating from youth (if not inherited) and aggravated by bad food and neglect.

The touching document addressed to his brothers in 1802, and known as his "will," should be read in its entirety, as given by Thayer (iv. 4). No verbal quotation short of the whole will do it justice. It runs almost as one long unbroken sentence through the whole tragedy of Beethoven's life as he knew it then and foresaw its future. It dwells upon his natural love of society and his dread of it in his present and future condition. It reproaches men for judging him to be pugnacious and obstinate without suspecting that he may be incurably ill, and terrified lest the cause should appear. Beethoven declared that when those near him had heard a flute or a singing shepherd while he heard nothing, he was only prevented from taking his life by the thought of his art, for it seemed impossible for him to leave the world until he had brought out all that of which he felt himself to be capable. He requests that after his death his doctor shall be asked to describe his illness and to append it to this document in order that at least then the world may be as far as possible reconciled with him. He leaves his brothers his property, such as it is, and declares that only force of character has preserved his life and his courage through all his misery.

And, indeed, his art and his courage rose far above any level attainable by those artists who are slaves to the "personal note," for his chief occupation at the time of this document was his 2nd symphony, the most brilliant and triumphant piece that had ever been written up to that time. On a smaller scale, in which mastery was the more easily attainable as experiment was more readily tested, Beethoven was sooner able to strike a tragic note, and hence the process of growth in his style is more readily traceable in the pianoforte works than in the larger compositions which naturally represent a series of crowning results. Only in his last period does the pianoforte cease to be Beethoven's normal means of expression. Accordingly, the sonatas may conveniently be given a more prominent place than the greater works in our discussion of Beethoven's art. They are a key to all the rest.

Anxieties.—Deafness is a cause of much inconvenience in conversation long before it is noticeable in music, and in 1806 Beethoven could still conduct his opera *Fidelio* and be much annoyed by inattention to his nuances; and his last appearance as a player was not until 1814, when he made a great impression with his B flat trio, op. 97. At the end of Nov. 1822 an attempt to conduct proved disastrous. The touching incident in 1824 has been described; but up to the last Beethoven seems to have found or imagined that ear-trumpets (of which a collection is now preserved at Bonn) were of use to him in playing to himself, though his friends were often pained when the pianoforte was badly out of tune, and were overcome when Beethoven in soft passages did not make the notes sound at all. The instrument sent to him by Broadwood in 1817-18 gave him great pleasure and he answered it with a characteristically cordial and quaint letter in the best of bad French. His fame in England was often a source of great comfort to him, especially in his last illness, when the London Philharmonic Society, for which the 9th symphony was written and a 10th symphony projected, sent him £100 in advance of the proceeds of a benefit concert which he had begged them to give—being in very straitened circumstances, as he would make no use of the money which he had deposited in the bank for his nephew.

This nephew was the cause of most of his anxiety and distress

in the last 12 years of his life. His brother, Kaspar Karl, had often given him trouble; for example, by obtaining and publishing juvenilia, such as the trio-variations, op. 44, the sonatas, op. 49, and other trifles, of which the late opus number is thus explained. In 1815, after Beethoven had quarrelled with his oldest friend, Stephan Breuning, for warning him against trusting his brother in money matters, Kaspar died, leaving a widow of whom Beethoven strongly disapproved, and a son, nine years old, for the guardianship of whom Beethoven fought the widow through all the law courts.

The boy turned out unworthy of his uncle's persistent devotion, and gave him every cause for anxiety. He failed in all his examinations, including an attempt to learn some trade in the polytechnic school, whereupon he fell into the hands of the police for attempting suicide, and, after being expelled from Vienna, joined the army. Beethoven's passionately affectionate nature could neither educate nor understand a human being whose impulses were not strenuous. The boy had really a not much better chance in his uncle's hands than in his mother's. A judicial decision most unfortunately stopped his being sent to a good school in Russia. But Thayer, a faithful judge in matters of humanity, points out that long after the sentimental biographers of Beethoven had done their worst for the nephew, that person pulled himself together and married respectably. He did nothing so mean in requital of Beethoven's inexhaustible affection as the spirit shown by writers who omit to record this.

Character.—Beethoven suffered throughout his whole life for lack of outlet for his affections. He was often deeply in love and made no secret of it; but, after some vaguely rumoured sowings of wild oats he became as fierce as Browning in his resentment of the "artistic temperament" in morals; and his attachments, though mostly to persons unattainably above him in rank, never gave rise to scandal or ridicule. Penitence is not a fashionable virtue in this 20th century; but Joachim has finely described Beethoven as a penitent; and this characteristic does not narrow, but enhances, the unorthodoxy, the humour and tragedy which in his art are blended as inextricably as in Shakespeare and in life. Beethoven's orthodoxy in morals amuses the Philistine when it shows itself in his objections to Mozart's *Don Giovanni*, and in his reasons for selecting the subject of *Fidelio* for his own opera. But genius is far too independent of convention to abuse it; and Beethoven's character, with its masterfulness, its *sæva indignatio* and its penitence, is as far beyond the shafts of Philistine wit as his art.

At the beginning of 1827 Beethoven had projects for a 10th symphony, music to Goethe's *Faust*, and (under the stimulus of his newly acquired collection of Handel's works) any amount of choral music, compared to which all his previous compositions would have seemed but a prelude. But he was in bad health; the hospitality of his brother Johann, did not include bedroom fires and closed carriages; and it resulted in a chill which ended in a fatal illness. A week before his death Beethoven was still full of his projects. Three days before the end he added a codicil to his will, and saw Schubert, whose music had aroused his keen interest. But Beethoven was not able to speak to him, though he afterwards spoke of the Philharmonic Society and the English; almost his last words being "God bless them." On March 26, 1827, during a fierce thunderstorm, he died.

BEETHOVEN'S WORKS

The Three Styles.—The division of Beethoven's work into three styles has been universally accepted, and is based on obvious facts. The styles, however, are not rigidly separated, either in themselves or in chronology. Nor can the popular description of Beethoven's first manner as "Mozartian" be accepted as doing justice to a style which differs more radically from Mozart's than Mozart's differs from Haydn's. The style of Beethoven's third period is no longer regarded as "showing an obscurity traceable to his deafness"; but we have, perhaps, only recently outgrown the belief that his later treatment of form is revolutionary.

The peculiar interest and difficulty in tracing Beethoven's artistic development are that the changes in the materials and range of his art were as great as those in the form, so that he appears

in the light of a pioneer, while the art with which he started was nevertheless already a perfectly mature and highly organized thing. And he is also extraordinary in this, that his power of constructing perfect works of art never deserted him while he revolutionized his means of expression. This may be true, though less obviously, of other great artists. But in mature art vital differences in works of similar form are generally more likely to be overlooked than to force themselves on the critic's attention. And when they become so great as to make a new epoch, it is generally at the cost of a period of experiment with perishable results. Nevertheless Beethoven's art moves farther from Mozart's than Mozart's moves from Handel's; and this in a process of development so smooth that its true "periods" should be marked as special stages for each particular work.

Evidence of the Sketch-books.—No artist has ever left more authoritative documentary evidence as to the steps of his development than Beethoven. In boyhood he seems to have acquired the habit of noting down all his musical ideas exactly as they first struck him. It is easy to see why in later years he referred to this as a "bad habit," for it must often take longer to jot down a crude idea than to reject it. But Beethoven had acquired that habit; and thereby he has, perhaps, misled some critics into over-emphasizing the contrast between his "tentative" self-critical methods and the quasi-extempore outpourings of Mozart. But it is probable that in every thoughtful mind every apparently sudden inspiration is preceded by some anticipatory mood in which the idea was sought and its first faint indications tested and rejected so instantaneously as to leave no impression on the memory.

The number and triviality of Beethoven's preliminary sketches should not, then, be taken as evidence of a timid or vacillating spirit. But if we regard his sketches as his diary their significance becomes inestimable. They cover every period of Beethoven's career, and represent every stage of nearly all his important works, as well as of innumerable trifles, including ideas that did not survive to be worked out. And the type of self-criticism is the same from beginning to end. The sketches of the first period show no lack of attention to elements that seem more prominent in the third. The difference between Beethoven's three styles appears first in its full proportions when we realize this complete continuity of his method and art.

First Period Works.—While he was handling a range of ideas not, to modern ears, glaringly different from Mozart's, he had no reason to use a glaringly different language. His contemporaries, however, found it more difficult to see the resemblance; and, though their criticism was often violently hostile, they saw with prejudice a daring originality which we may as well learn to appreciate with study.

Beethoven himself in later years partly affected and partly felt a lack of sympathy with his own early style. But he had other things to do than to criticize it. Modern prejudice has not his excuse, and the neglect of Beethoven's early works is no less than the neglect of the key to the understanding of his later. It is also the neglect of a mass of mature art that already places Beethoven on the same plane as Mozart, and contains perhaps the only traces in all his work of a real struggle between the forces of progress and those of construction. The truth is that there are several styles in Beethoven's first period, in the centre of which, "proving all things," is the true and mature Beethoven, whose scope is destined to expand beyond recognition.

The promise appears in the very earliest works. The pianoforte quartets which he wrote at the age of 15 are, no doubt, clumsy and childish in execution to a degree that contrasts remarkably with the works of Mozart's, Mendelssohn's or Schubert's boyhood; yet they contain material actually used in the sonatas, op. 2, Nos. 1 and 3. And the passage in op. 2, No. 3, is that immediately after the transition (bar 27 *et seq.*) where, as Beethoven then states it, it embodies one of his most epoch-making discoveries, namely, the art of organizing a long series of apparently free modulations by means of a systematic progression in the bass. In the childish quartet the principle is only dimly felt, but it is indisputably present; and it afterwards gives inevitable dramatic truth to such passages as the climax of the development in the sonata, op. 57

(commonly called *Appassionata*), and, throughout the chaos of the mysterious introduction to the C major string-quartet, op. 59, No. 3, prepares us for the world of loveliness that arises from it.

The First Sonatas.—The first three pianoforte sonatas, op. 2, show the different elements in Beethoven's early style as clearly as possible. Sir Hubert Parry has aptly compared the opening of the sonata, op. 2, No. 1, with that of the finale of Mozart's G minor symphony, to show how much closer Beethoven's texture is. The slow movement (also adapted from a juvenile quartet) well illustrates the rare cases in which Beethoven imitates Mozart to the detriment of his own proper richness of tone and thought, while the finale in its central episode brings a misapplied and somewhat diffuse structure in Mozart's style into direct conflict with themes as Beethovenish in their terseness as in their sombre passion.

The second sonata is flawless in execution, and entirely beyond the range of Haydn and Mozart in harmonic and dramatic thought, except in the finale. And it is just in the adoption of the luxurious Mozartian rondo form as the crown of this work that Beethoven shows his true independence. He adopts the form, not because it is Mozart's but because it is right and because he can master it. The opening of the second subject in the first movement (bar 58 *et seq.*) is a wonderful application of the harmonic principle already mentioned in connection with the early piano quartets. In all music nothing equally dramatic can be found before the D minor sonata, op. 31, No. 2, which is rightly regarded as marking the beginning of Beethoven's second period. The slow movement, like those of op. 7 and a few other early works, shows a thrilling solemnity that immediately proves the identity of the pupil of Haydn with the creator of the 9th symphony.

The little scherzo no less clearly foreshadows the new era in music by the fact that in so small and light a movement a modulation from A to G sharp minor can occur too naturally to excite surprise. If the later work of Beethoven were unknown there would be very little evidence that this sonata was by a young man, except, perhaps, in the abruptness of style in the first movement, an abruptness which is characteristic, not of immaturity, but of art in which problems are successfully solved for the first time. This abruptness is, however, in a few of Beethoven's early works carried appreciably too far. In the sonata in C minor, op. 10, No. 1, for example, the more vigorous parts of the first movement lose in breadth from it, while the finale is almost stunted.

Boldness and Breadth.—But Beethoven was not content to express his individuality only in an abrupt or epigrammatic style. From the outset breadth was also his aim, and while he occasionally attempted to attain a greater breadth than his resources would properly allow (as in the first movement of the sonata, op. 2, No. 3, and that of the violoncello sonata, op. 5, No. 1, in both of which cases a kind of extempore outburst in the coda conceals the collapse of his peroration), there are many early works in which he shows neither abruptness of style nor any tendency to confine himself within the limits of previous art.

The C minor trio, op. 1, No. 3, is not more remarkable for the boldness of thought that made Haydn doubtful as to the advisability of publishing it, than for the perfect smoothness and spaciousness of its style. These qualities Beethoven at first naturally found easier to retain with less dramatic material, as in the other trios in the same opus, but the C minor trio does not stand alone. It represents, perhaps, the most numerous, as certainly the noblest, class of Beethoven's early works. Certainly the smallest class is that in which there is unmistakable imitation of Mozart, and it is significant that almost all the examples of this class are works for wind instruments, where the technical limitations narrowly determine the style and discourage the composer from taking things seriously. Such works are the beautiful and popular septet, the quintet for pianoforte and wind instruments (modelled superficially, yet closely and with a kind of modest ambition, on Mozart's wonderful work for the same combination) and, in a more free, but not more weighty style, the trio for pianoforte, clarinet and violoncello, op. 11, and the horn sonata, op. 17.

The Second Period.—It is futile to discuss the point at which Beethoven's second manner may be said to begin, but he has himself given us excellent evidence as to when and how his first man-

ner (as far as that is a single thing) became impossible to him. Through quite a large number of works, beginning perhaps with the great string quintet, op. 29, new types of harmonic and emotional expression had been assimilated into a style at least intelligible from Mozart's point of view. Indeed, Beethoven's favourite way of enlarging his range of expression often seems to consist in allowing the Titanic force of his new inventions and the formal beauty of the old art to indicate by their contrast a new world grander and lovelier than either. Sometimes, as in the C major quintet, the new elements are too perfectly assimilated for the contrast to appear. The range of key and depth of thought are beyond those of Beethoven's first manner, but the smoothness is that of Mozart.

In the three pianoforte sonatas, op. 31, the struggle of the transition is as manifest as its accomplishment is triumphant. The first movement of the first sonata (in G major) deals with widely separated keys on new principles. These are embodied in a style which for abruptness and jocular paradox is hardly surpassed by Beethoven's most nervous early works. The exceptionally ornate and dilatory slow movement reads almost like a protest; while the finale begins as if to show that humour should be beautiful, and ends by making fun of the beauty. The second of these sonatas (in D minor) is the greatest work which Beethoven had as yet written. Its first movement, already cited above in connection with the dramatic rising bass in op. 2, No. 2, is like that of the Sonata *Appassionata*, a *locus classicus* for such powerful devices. And it is worth noting that the only sketch known of this movement is a sketch in which nothing but its sequential plan is indicated. In the third sonata Beethoven enjoys on a higher plane an experience which he had often indulged in before, the attainment of smoothness and breadth by means of a delicately humorous calm which gives scope to the finer subtleties of his new thoughts.

Beethoven himself wrote to his publisher that these three sonatas represented a new phase in his style; but when we realize his artistic conscientiousness it is not surprising that they should be contemporary with larger works like the 2nd symphony, which are characteristic rather of his first manner. His whole development is ruled by his determination to let nothing pass until it has been completely mastered; and, long before this, his sketch-books show that he had many ambitious ideas for a 1st symphony, and that it was a deliberate process that made his ambitions dwindle into something that could be safely realized in the masterly little comedy with which he began his orchestral career. The easy breadth and power of the 2nd symphony represent an amply sufficient advance, and leave his forces free to develop in less expansive forms those vast energies for which afterwards the orchestra and the string-quartet were to become the natural field.

Beethoven's Rubicon.—In the Waldstein sonata, op. 53, we see Beethoven's second manner forcibly displacing his first; that is to say, we reach a state of things in which the two can no longer form an artistic contrast. The work, as we know it, is not only perfect, but has all the qualities of art in which the newest elements have long been familiar. The opening is on the same harmonic train of thought as that of the sonata, op. 31, No. 1, but there is no longer the slightest need for a paradoxical or jocular manner. On the contrary, the harmonies are held together by an orderly sequence in the bass, and the onrush is that of some calm diurnal energy of nature.

The short introduction to the finale is harmonically and emotionally the most profound thing in the sonata, while the finale itself uses every new resource in the triumphant attainment of a leisure more splendid than any conceivable in the most spacious of Mozart's rondos. Yet it is well known that Beethoven originally intended the beautiful Andante in F, afterwards published separately, to be the slow movement of this sonata. That Andante is, like the finale, a spacious and gorgeous rondo, which probably Beethoven himself could not have written at an earlier period. The modulation to D flat in its principal theme, and that to G flat near the end, are its chief harmonic effects and stand out in beautiful relief within its limits. After the first movement of the Waldstein sonata they would be as out of place as the line, "But hist! I must dissemble" in a play by Ibsen.

The sketch-books show that Beethoven when he first planned the sonata, was by no means inattentive to the balance of harmonic colour in the whole scheme, but that at first he did not realize how far that scheme was going to carry him. He originally thought of the slow movement as in E major, a remote key to which, however, he soon assigned the more intimate position of complementary key in the first movement. He then worked at the slow movement in F with such zest that he did not discover until the whole sonata was finished that he had raised the first and last movements to an altogether higher plane of thought, though the redundancy of the two rondos in juxtaposition and the unusual length of the sonata were so obvious that his friends ventured to point them out.

Beethoven's revision of his earliest works is now known to have been extensive and drastic; but this is the first instance—and *Fidelio* and the quartet in B flat, op. 131, are the only other instances—of any later work needing important alteration after it was completely executed.

Central Masterpieces.—From this point up to op. 101 we may study Beethoven's second manner entirely free from any survivals of his first, even as a legitimate contrast; though it is as impossible to fix a point before which his third manner cannot be traced as it is to ignore the premonitions of his second manner in his early works. The distinguishing features in Beethoven's second style are the result of a condition of art in which enormous new possibilities have become so well known that the need for paradoxical emphasis has vanished, but the remoter issues have not yet come into view. Hence these works have become for most people the best-known and best-loved type of classical music. In their perfect fusion of untranslatable dramatic emotion with every beauty of musical design and tone they have never been equalled, nor is it probable that any other art can show a wider range of thought embodied in a more perfect form. In music itself there is nothing else of so wide a range without grave artistic defects from which Beethoven is entirely free. Wagnerian opera aims at an ideal as truly artistic, but in range so far wider than Beethoven's that it passes beyond the bounds of pure music altogether. Within those bounds Beethoven remained, and even the apparent exceptions (such as *Fidelio* and his two great examples of "programme music," the Pastoral symphony and the sonata, *Les Adieux*) only show how universal his conception of pure music is. Extraneous ideas had here struck him as magnificent material for instrumental music, and he never troubled to argue whether instrumental music is the better or worse for expressing extraneous ideas.

To describe the works of Beethoven's second period here would be to describe a library of well-known classics. Further illustrations will be found in the articles on SONATA FORMS, CONTRAPUNTAL FORMS, HARMONY and INSTRUMENTATION. It remains here to indicate the essential features of his third style, and to conclude with a survey of his influence on the history of music.

The Third Period.—Beethoven's third style arose imperceptibly from his second. His deafness had very little to do with it; indeed, all his epoch-making discoveries in orchestral effect date from the time when he was already far too much inconvenienced to test them in a way which would satisfy anyone who depended more upon his ear than upon his imagination. The general features of Beethoven's latest style may be paralleled by the tendencies of all great artists who have handled their material until it contains nothing that has not been long familiar with them. Such tendencies lead to an extreme simplicity of form, underlying an elaboration of detail which may at first seem bewildering until we realize that it is purely the working out to its logical conclusions of some idea as simple and natural as the form itself. The form, however, will be not merely simple, but individual. Different works will show such striking external differences of form that a criticism which applies merely *a priori* or historic standards will be tempted by the fallacy that there is less form in a number of such markedly different works than in a number of works that have one scheme in common.

The extreme simplicity of Beethoven's themes in the first two movements of the quartet in B flat, op. 131, and the tremendous complexity of the texture into which they are woven, at first seem

mysterious and intangible rather than astonishing. The boldness with which the slow introduction is blended in broad statement and counter-statement with the allegro, is directly impressive, as is also the entry of the second subject with its dark harmony and tone, but the work needs long familiarity before its vast mass of thought reveals itself to us in its true lucidity. Such works are "dark with excessive bright." When we enter into them they are transparent as far as our vision extends, and their darkness is that of a depth that shines as we penetrate it. In all probability only a veil of familiarity prevents our finding the same kind of difficulty in Beethoven's earlier works.

Increasing Polyphony.—What is undoubtedly newest in the last works is their ubiquitous polyphony, an element always essential to the life of a composition, but never so prominent before, except in regular fugues. Polyphony inevitably draws attention to detail, and thus Beethoven in his middle period found its more obvious forms but little conducive to the breadth of designs which were not as yet sufficiently familiar to take any but the foremost place. Hence, among other interesting features of that second period, his marked preference for themes founded on rhythmic figures of one note, e.g., the famous "four taps" in the C minor symphony; an identical rhythm in a melodious theme of very different character in the G major concerto; a similar figure in the Sonata Appassionata, the first theme of the scherzo of the F major quartet, op. 59, No. 1, and the five drum-beats in the violin concerto. Such rhythms give thematic life to an inner part without distracting attention from the surface. But in proportion as polyphony loses its danger, so does the prominence of such rhythmic figures decrease, until in Beethoven's last works they are no more noticeable than other kinds of simplicity. The impression of crowded detail is naturally more prominent the smaller the means with which Beethoven works and the less outwardly dramatic his thought. Thus those most gigantic of all musical designs, the 9th symphony, and the Mass in D, are, but for the mechanical difficulties of the choral writing, as directly impressive as the works of the second period; and the enormous pianoforte sonata, op. 106, is in its first three movements easier to follow than the extremely terse and subtle works on a smaller scale that preceded it (sonata in A major, op. 101, and the two sonatas for violoncello, op. 102).

New Fugue Forms.—Beethoven's increasing need for polyphony soon led him to write in fugue, not only, as previously, by way of episodic contrast to passages and designs in which the form and not the texture is the main object of interest, but as the consummation of a unity of form and texture that allows the mind to concentrate itself on the texture alone. This union was not effected without a struggle, the traces of which present a parallel to the abrupt sententiousness of some of Beethoven's early works. In his fugue-writing the impulse is so dramatic that it demands all Beethoven's firmness and resource in relation to the form of the whole piece. Yet the listener must attend not to the whole form, but must listen to the texture only, and let the form remain in the background of his mind. This notion is, in relation to the style, a paradox; and accordingly the texture is forced upon the listener's attention by a continual series of ruthlessly logical bold strokes of harmony. From this and from the notorious violence of Beethoven's choral writing, and also from his well-known technical struggles in his years of pupillage, the easy inference has been drawn that Beethoven never was a great master of counterpoint. Beethoven himself might afford to think so; but his art is on the plane where an imperfect style becomes no worse than an imperfect instrument of which the defects can all be turned into qualities. And the fact is that Beethoven's counterpoint becomes rough only under dramatic and emotional stress. No doctor of music could do better triple counterpoint than that in the andante of the string quartet in C minor, op. 18, No. 4, and there is no trace of crudeness in Beethoven's handling of harmonies, basses, or inner parts at any period of his career.

Beethoven may have mastered some things with difficulty, but he mastered nothing incompletely; and where he is not orthodox it is safest to conclude that orthodoxy is wrong. Had he lived for another ten years he would certainly have produced many choral works and many other great instrumental works in which this last

remaining element of conflict between texture and form would have dwindled away. But while this would doubtless result in such works being easier to follow, it would yet be no sound criterion by which to stigmatize as an immaturity the roughness of the polyphonic works that we know. That roughness is a necessary condition, without which Beethoven's extant material could have received only the academic handling of a dead language. And by it was created that permanent reconciliation of polyphony and form from which has arisen almost all that is true in "Romantic" music, all that is peculiar to the thematic technique of Wagnerian opera, and all the perfect smoothness of Brahms's polyphony.

Supreme Artistic Concentration.—The depth of thought and closeness of texture in Beethoven's later works are, of course, the embodiment of a no less profound emotional power. If we at times feel that the last quartets are more introspective than dramatic, that is only because Beethoven's dramatic sense is higher than ours. The subject is too large and too subtle for dogmatism to be profitable; and we cannot in Beethoven's case, as we can in Bach's, cite a complete series of illustrations of his musical ideas from his treatment in choral music of words which themselves interpret the intention of the composer. There is so little but the music itself by which one can express Beethoven's thought, that the utmost we can do here is to refer the reader, as before, to the articles on SONATA FORMS, HARMONY, INSTRUMENTATION, OPERA and MUSIC, where he will find further attempts to indicate in what sense pure music can be described as dramatic and expressive of emotion.

As our range of investigation widens, and thoroughness of analysis and study increases, so we shall surely find in ourselves an ever-deepening conviction that Beethoven, whether in range, depth and truth of thought, perfect sense of beauty, or absolute conscientiousness of execution, is the greatest musician, perhaps the greatest artist, that ever lived. There is no means of measuring Beethoven's influence upon subsequent music. Every composer of every school claims it. The immense changes which he brought about in the range of music have their most obvious effect in the possibilities of emotional expression; and so every outbreak of vulgarity or sentimentality can with impunity claim descent from Beethoven, though its ancestry may be no higher than Meyerbeer. Consider, again, that confusion of thought which regards a series of works markedly different in form as containing less form than any number of works all cast in the same mould. Hence the works of Beethoven's third period have been cited in defence of more than one "revolution," attempted in a form which never existed in any true classic, for the purpose of setting up something the revolutionist has not yet succeeded in inventing.

Immeasurable Influence.—To measure Beethoven's influence is like measuring Shakespeare's. It is an influence either too vague or too profound to define. Perhaps the truest account of it would be that which ignored its presence in the works of ill-balanced artists, or even in the works of those who profited merely by an increase of technical and harmonic resource which, though effected by Beethoven, would, after the French Revolution and the Napoleonic wars, almost certainly have to some extent arisen, from sheer necessity of finding expression for the new experience of humanity, if Beethoven had never existed. Setting aside, then, all instances of mere domination, and of a permanently established new world of musical thought, and omitting Schubert and Weber as contemporaries, the one attracted and the other partly repelled, we may, perhaps, take three later composers, Schumann, Wagner and Brahms, as the leading examples of the way in which Beethoven's influence is definitely traceable as a creative force.

The depth and solemnity of Beethoven's melody and later polyphonic richness are a leading source of Schumann's inspiration, though Schumann's artistic schemes exclude any high degree of organization on a large scale. Beethoven's late polyphony is carried on by Brahms to the point at which perfect smoothness of style is once more possible, and there is no aspect of his form which Brahms neglects or fails to realize with that complete originality which has nothing to fear from its ancestry. Wagner does not handle the same art-forms; his task is different; but Beethoven was the inspiring source, not only of his purely musical sense, but

also of his whole sense of dramatic contrast and fitness. When he had shaken off the habits of second-rate operatic styles there remained to him, pre-eminently in his music and more imperfectly realized in his drama, a power of combining contrasted emotions found only in the greatest dramatists. Bach and Beethoven are the sources of the polyphonic means of expression by which he attains this achievement. Beethoven alone is the extraneous source of his knowledge that it was possible.

It is as certain as anything in the history of art that there will never be a time when Beethoven's work does not occupy the central place in a sound musical mind. When Beethoven is out of fashion, that is because people are afraid of drama and of sublime emotions. And that amounts merely to a fear of life.

CLASSIFIED SUMMARY OF BEETHOVEN'S WORKS

A. WORKS IN SONATA FORMS

Thirty-two pianoforte sonatas: 1 4-hand sonata; 10 violin sonatas; 5 violoncello sonatas; 1 horn sonata; 7 pianoforte trios (1 with clarinet); 5 string trios; 1 trio for flute, violin and viola; 1 trio for 2 oboes and cor anglais; 16 string quartets and a fugue originally intended for the finale of the quartet, op. 130; 1 quintet for pianoforte and wind instruments (also freely arranged as a quartet for pianoforte and strings); 2 string quintets and a quintet arrangement of the trio, op. 1, No. 3; 2 sextets, one for strings and 2 horns, the other for wind instruments; 1 septet; 1 octet for wind, arranged from the string quintet, op. 4 (not vice versa, as is usually believed); 9 symphonies (the 9th with a choral finale); 5 pianoforte concertos, 1 violin concerto, and 1 triple concerto for pianoforte, violin and violoncello.

B. CHORAL, DRAMATIC AND VOCAL WORKS

Two masses (C major, op. 89; *Missa Solemnis* in D, op. 123); oratorio, *Christus am Ölberge*; opera, *Fidelio* (first version entitled *Leonora*); overture and incidental music to Goethe's *Egmont*; ballet, *Die Geschöpfe des Prometheus*; 2 festival dramatic pieces *d'occasion*, *Die Ruinen von Athen* and *König Stephan*; 1 fantasia for pianoforte, chorus and orchestra; songs of which the *Liederkreis*, op. 98 (a continuous song-cycle), is important, while the 6 religious songs, op. 39, and the long aria *Adelaide* are the best known of the remaining works in this medium, which was not Beethoven's forte.

C. SMALLER WORKS AND WORKS WITHOUT OPUS NUMBERS

The pianoforte sets of variations include those on a Diabelli waltz, the greatest variation work since Bach's Goldberg variations; the *Prometheus* variations, op. 35 (foreshadowing the finale of the *Eroica* symphony); the 32 variations in C minor (a great *chaconne*, without opus number); and a wonderful early set of 24 on an air of Rhigini. Several smaller sets are worth study. The Andante in F originally belonged to the *Waldstein* sonata; and the fantasia, op. 77, foreshadows the choral fantasia and the finale to the 9th Symphony. Three sets of Bagatelles range from work revised from *Juvenilia* to Beethoven's last pieces for the pianoforte.

D. POSTHUMOUS WORKS

Two early cantatas are interesting as containing material afterwards used in *Fidelio*. An early symphony was published in 1912.

BEETLE, a name commonly applied to those insects which possess horny wing-cases; it is used to denote the cockroaches (*q.v.*) (black beetles), as well as the true beetles or *Coleoptera* (*q.v.*). From another word (O.E. *betel*, connected with "beat") comes "beetle" in the sense of a mallet, and the "beetling-machine," which subjects fabrics to a hammering process.

BEET-LIFTER: see HARVESTING MACHINERY.

BEETS, NIKOLAAS (1814-1903), Dutch poet, was born at Haarlem, and constant references in his poems and sketches show how deeply the beauty of that town and its neighbourhood impressed his imagination. In his youth Beets was carried away on the tide of Byronism, which was then sweeping over Europe, and his early works *Jose* (1834), *Kuser* (1835) and *Guy de Vlaming* (1837) are of the most impassioned type. But he was beginning in prose the composite work of humour and observation which has made him famous, and which certainly had nothing in the least Byronic about it. This was the celebrated *Camera Obscura* (1839), the most successful imaginative work which any Dutchman of the 19th century produced. This work, published under the pseudonym of "Hildebrand," goes back in its earliest inception to the year 1835 and consists of complete short stories, descriptive sketches and studies of peasant life—filled with humour and pathos. In middle life he published collections of verse—*Cornflowers* (1853) and *New Poems* (1857)—in which the romantic melancholy was found to have disappeared, and to have left in its place a gentle sentiment and a depth of religious feeling. In 1873-75 Beets collected his works in three volumes.

BEET SUGAR: see SUGAR and BEET.

BEFANA (Ital., corrupted from *Epifania*, Epiphany), the Italian female counterpart of Santa Claus (St. Nicholas). On Epiphany, or Twelfth Night, she fills children's stockings with presents. Tradition relates that she was too busy to see the Three Wise Men of the East pass on their journey to pay adoration to the Saviour, saying that she could see them on their return. They went back another way, and Befana was punished by having to look for them forever. In spite of her Santa Claus character, her name is used by Italian mothers to frighten the babies.

BEFFROY DE REIGNY, LOUIS ABEL (1757-1811), French dramatist and man of letters, was born at Laon on Nov. 6, 1757. Under the name of "Cousin Jacques" he founded a periodical called *Les Lunes* (1785-1787). The *Courrier des planètes ou Correspondance du Cousin Jacques avec le firmament* (1788-1792) followed. *Nicodème dans la lune, ou la révolution pacifique* (1790) a three-act farce, is said to have had more than four hundred representations. In spite of his protests against the Revolution he escaped interference through the influence of his brother, Louis Étienne Beffroy, who was a member of the Convention. Of *La Petite Nanette* (1795) and several other operas he wrote both the words and the music. His *Dictionnaire néologique* (3 vols., 1795-1800) of the chief actors and events in the Revolution was interdicted by the police and remained incomplete. Beffroy died in Paris on Dec. 17, 1811.

BEGAS, KARL (1794-1854), German historical painter, was born in Heinsberg, near Aix-la-Chapelle, on Sept. 30, 1794, and died on Nov. 23, 1854, at Berlin. He studied in Paris under Gros. In 1814 his copy of the "Madonna della Sedia" was bought by the king of Prussia. He was engaged to paint several large biblical pictures, and in 1825, after his return from Italy, continued to produce paintings which were placed in the churches of Berlin and Potsdam. Begas was also celebrated as a portrait-painter. His son OSKAR (1828-1883) was also a painter and professor of painting at Berlin. He executed the pictures in the lunettes of the Berlin Rathaus.

BEGAS, REINHOLD (1831-1911), German sculptor, younger son of Karl Begas, the painter, was born at Berlin on July 15 1831, and died there on Aug. 3 1911. He received his early education (1846-51) in the ateliers of C. D. Rauch and L. Wichmann. During a period of study in Italy, from 1856 to 1858, he was strongly influenced by the study of Michelangelo and by his admiration for the art of the baroque period. After the execution of the group "Borussia," for the façade of the exchange

in Berlin, he was for a few months in 1861, professor at the art school at Weimar. The statue of Schiller for the Gendarmen Markt in Berlin, was his work. From 1870 onwards Begas dominated the plastic art in Prussia, especially in Berlin. Among his chief works during this period were the colossal statue of Borussia for the Hall of Glory; the Neptune fountain in bronze on the Schlossplatz; the statue of Alexander von Humboldt, all in Berlin; the sarcophagus of the Emperor Frederick III. in the mausoleum of the Friedenskirche at Potsdam; and the national monument to the Emperor William (see BERLIN), the statue of Bismarck before the Reichstag building, and several of the statues in the Siegesallee. Begas was a most versatile artist. If his preference was for mythological and decorative subjects, of which his Mercury and Psyche (1874) is a good example, he was the most famous German sculptor of his time in portraiture, and executed portrait busts of many of his great contemporaries.

See A. G. Meyer, "Reinhold Begas" in *Künstler-Monographien*, ed. H. Knackfuss, xx. (Bielefeld, 1901).

BEGGAR, one who begs, particularly one who gains his living by asking the charitable contributions of others. The word, with the verbal form "to beg," in M.E. *beggen*, is of obscure history. The words appear first in English in the 13th century, and were early connected with "bag," with reference to the receptacle for alms carried by the beggars. The most probable derivation of the word, and that now generally accepted, is that it is a corruption of the name of the lay communities known as Beguines and Beghards, which, shortly after their establishment, followed the friars in the practice of mendicancy. It has been suggested, however, that the origin of "beg" and "beggars" is to be found in a rare O.E. word, *bedecian*, of the same meaning, which is apparently connected with the Gothic *bidjan*, cf. German *betteln*; but between the occurrence of *bedecian* at the end of the 9th century and the appearance of "beggar" and "beg" in the 13th, there is a blank, and no explanation can be given of the great change in form. For the English law relating to begging and its history, see CHARITY, POOR LAW and VAGRANCY.

BEGGAR-MY-NEIGHBOUR, a simple card-game. An ordinary pack is divided equally between two players, and the cards are held with the backs upward. The first player lays down his top card face up, and the opponent plays his top card on it and this goes on alternately as long as no court-card appears, but if either player turns up a court-card, his opponent has to play four ordinary cards to an ace, three to a king, two to a queen, one to a knave, and when he has done so the other player takes all the cards on the table and places them under his pack; if, however, in the course of this playing to a court-card, another court-card turns up, the adversary has in turn to play to this, and as long as neither has played a full number of ordinary cards to any court-card the trick continues. The player who gets all the cards into his hand is the winner.

BEGONIA, a large genus (family Begoniaceae) of succulent herbs or undershrubs, with about 750 species in tropical moist climates, especially South America and India. Innumerable garden hybrids and varieties are known which come mainly from species introduced between 1864 and 1867; many are tuberous. The flowers are usually showy and large, white, rose, scarlet or yellow in colour; they are unisexual, the male containing numerous stamens, the female having a large inferior ovary and two to four branched or twisted stigmas. The fruit is a winged capsule with numerous seeds. The leaves, often large and variegated, are unequal-sided. The plant can be raised from seeds or from cuttings.

BEGUINES, at the present time the name of the members of certain lay sisterhoods established in the Netherlands and Germany, the enclosed district within which they live being known as a beguinage (Lat. *beginagium*). The equivalent male communities, more usually called Beghards (Lat. *baghardi*), have long ceased to exist. The origin of the names Beguine and Beghard has been the subject of much controversy; but it is now universally admitted that both the institution and the name of the Beguines are derived from Lambert le Bègue, a priest of Liège, who died about the year 1187.

About the year 1170 Lambert, who had devoted his fortune to founding the hospital and church of St Christopher for the

widows and children of crusaders, conceived the idea of establishing an association of women, who, without taking the monastic vows, should devote themselves to a life of religion. The effect of his preaching was immense, and large numbers of women, many of them left desolate by the loss of their husbands on crusade, came under the influence of a movement which was attended with all the manifestations of what is now called a "revival." About the year 1180 Lambert gathered some of these women, who had been ironically styled "Beguiues" by his opponents, into a semi-conventual community, which he established in a quarter of the city belonging to him around his church of St. Christopher. The district was surrounded by a wall within which the Beguiues lived in separate small houses, subject to no rule save the obligation of good works, and of chastity so long as they remained members of the community. After Lambert's death the movement rapidly spread, first in the Netherlands and afterwards in France—where it was encouraged by the saintly Louis IX.—Germany, Switzerland and the countries beyond. Women of all classes were admitted; and, though there was no rule of poverty, many wealthy women devoted their riches to the common cause. The Beguiues did not beg; and, when the endowments of the community were not sufficient, the poorer members had to support themselves by manual work, sick-nursing and the like.

The very looseness of their organization made it inevitable that the Beguine associations should follow very diverse developments. Some of them retained their original character; others fell completely under the dominion of the friars, and were ultimately converted into houses of Dominican, Franciscan or Augustinian tertiaries; others again fell under the influence of the mystic movements of the 13th century, turned in increasing numbers from work to mendicancy, practised the most cruel self-tortures, and lapsed into extravagant heresies that called down upon them the condemnation of popes and councils. All this tended to lower the reputation of the Beguiues. During the 14th century, indeed, numerous new Beguinages were established; but ladies of rank and wealth ceased to enter them, and they tended to become more and more mere almshouses for poor women. By the 15th century in many cases they had utterly sunk in reputation and at the Reformation the communities were suppressed in Protestant countries. In some Catholic countries they still survive in a reformed condition, but mainly as centres of benevolent work among the poor.

It is uncertain whether the parallel communities of men originated also with Lambert le Bègue. The first records are of communities at Louvain in 1220 and at Antwerp in 1228. The history of the male communities is to a certain extent parallel with the female, but they were never so numerous and their degeneration was far more rapid. The earliest Flemish Beghard communities were associations mainly of artisans who earned their living by weaving and the like, and appear to have been in intimate connection with the craft-gilds; but under the influence of the mendicant movement of the 13th century these tended to break up, and, though certain of the male beguinages survived or were incorporated as tertiaries in the orders of friars, the name of Beghard became associated with groups of wandering mendicants who made religion a cloak for living on charity; *beguigner* becoming in the French language of the time synonymous with "to beg," and *beghard* with "beggar," a word which, according to the latest authorities, was probably imported into England in the 13th century from this source (see BEGGAR). More serious still, from the point of view of the Church, was the association of these wandering mendicants with the mystic heresies of the Fraticelli, the Apostolici and the pantheistic Brethren of the Free Spirit. The situation was embittered by the hatred of the secular clergy for the friars, with whom the Beguiues were associated.

Matters came to a climax at the council of Vienne in 1311 under Pope Clement V., where the "sect of Beguiues and Beghards" were accused of being the main instruments of the spread of heresy, and decrees were passed suppressing their organization and demanding their severe punishment. The decrees were put into execution by Pope John XXII, and a persecution raged in which, though the pope expressly protected the female Beguine com-

munities of the Netherlands, there was little discrimination between the orthodox and unorthodox Beguiues. This led to the utmost confusion, the laity in many cases taking the part of the Beguine communities, and the Church being thus brought into conflict with the secular authorities. In these circumstances the persecution died down; it was, however, again resumed between 1366 and 1378 by Popes Urban V. and Gregory XI., and the Beguiues were not formally reinstated until the pontificate of Eugenius IV. (1431-47). The male communities did not survive the 14th century, even in the Netherlands, where they had maintained their original character least impaired.

See Herzog-Hauck, *Realencyklopädie* (3rd ed., 1897) s. "Beginen," by Herman Haupt, where numerous further authorities are cited; Gieseler, *Ecclesiastical History* (Eng. tr. vol. iii., Edinburgh, 1853); *Theologischer Jahresbericht*, 1902, page 495.

BEHAIM or BEHEM, MARTIN (1436?-1507), German navigator and geographer, was born at Nuremberg, according to one tradition, about 1436; according to Ghillany, as late as 1459. He was drawn to Portugal by participation in Flanders trade, and acquired a scientific reputation at the court of John II. He became (c. 1480) a member of a council appointed by King John for the furtherance of navigation and is said to have introduced into Portugal various improvements in nautical instruments. In 1484-85 he claimed to have accompanied Diogo Cão in his second expedition to West Africa, really undertaken in 1485-86, reaching Cabo Negro in 15°40' S. and Cabo Ledo still farther on. His pretensions have been disputed, and it is suggested that instead of sharing in this great voyage of discovery, the Nuremberger only sailed to the nearer coasts of Guinea, perhaps as far as the Bight of Benin, and possibly with José Visinho the astronomer and with João Affonso d'Aveiro, in 1484-86. Martin's later history, as traditionally recorded, was as follows. On his return from his West African exploration to Lisbon he was knighted by King John, who afterwards employed him in various capacities; but, from the time of his marriage in 1486, he usually resided at Fayal in the Azores, where his father-in-law, Jobst van Huarter, was governor of a Flemish colony. On a visit to his native city in 1492, he constructed his terrestrial globe, still preserved in Nuremberg, and often reproduced, in which the influence of Ptolemy is strongly apparent, but wherein some attempt is also made to incorporate the discoveries of the later middle ages (Marco Polo, etc.) As a scientific work it is unimportant, ranking far below the *portolani* charts of the 14th century. Its West Africa is marvellously incorrect; the Cape Verde archipelago lies hundreds of miles out of its proper place; and the Atlantic is filled with fabulous islands. Blunders of 10° are found in the localization of places the author claims to have visited: contemporary maps, at least in regard to continental features, seldom went wrong beyond 1°. It is generally agreed that Behaim had no share in Transatlantic discovery; and though Columbus and he were apparently in Portugal at the same time, no connection between the two has been established. He died at Lisbon on Aug. 8, 1507.

See A. von Humboldt, *Kritische Untersuchungen* (1836); F. W. Ghillany, *Geschichte des Seefahrers Martin Behaim* (1853); Eugen Gelcich in the *Mittheilungen* of the Vienna Geographical Society, vol. xxxvi. pp. 100, etc.; E. G. Ravenstein, *Martin de Bohemia* (Lisbon, 1900), *Martin Behaim, His Life and His Globe* (1909), and "Voyages of Diogo Cão and Bartholomeu Dias, 1482-88," in *Geographical Journal*, Dec. 1900. BEHAR AND ORISSA or BIHAR, a province of British India created in 1912 by separation from western Bengal, bounded on the north by Nepal and the Bengal district of Darjeeling, on the east by Bengal, on the south by the sea and the Madras presidency, and on the west by the Central Provinces and the United Provinces. Area (including Feudatory States) 111,809 square miles. Pop. (1921) 37,961,858. Capital, Patna.

Geology and Physical Aspects.—This heterogeneous province comprises the north-east coign of the Deccan plateau with a lowland alluvial fringe round about it. The plateau has a basis of gneissic, schistose and granitic rocks which received a covering of lower Gondwana rocks, including coal-bearing strata, at the end

of the Palaeozoic period. The plateau was subjected to heavy faulting and denudation before the upper Gondwana series was laid down, and in consequence the lower Gondwana layers, including coal measures, are found chiefly along east to west bands towards the northern edge of the plateau, where they have been faulted in and thus preserved. The Karharbari coalfield and the Rajmahal hills have lavas traversing the beds in dykes in the former, but interbedded in the latter, though both are said to be of the same age.

The coign of the plateau is deeply dissected by streams fed by monsoon rains, mostly relatively short and running low in the dry season, but the Son, a tributary of the Ganges, has a catchment area of 21,000 square miles. The Rajmahal hills in the east and their outliers cover about 2,000 square miles. The northern part of the plateau includes parts of South Behar and Chota Nagpur with the peak of Parasnath (4,479ft.) and numerous flat-topped hills, e.g., Neturhat Pat (3,356ft.), with a summit of 4 by 2½ miles. In Orissa are the peaks of Malayagiri (3,895ft.) and Meghasani (3,824ft.), the latter rich in iron ore.

The whole coign stands out into alluvial lowland, of the Ganges on the north, the Ganges delta on the east, and the coastal plain with the far spreading Mahanadi delta on the south-east. The province spreads in a long tongue south-westwards in the valley of the Tel, a feeder of the Mahanadi, separated from the coast by a continuation of the eastern Ghats, mainly in the Madras Presidency but including Bankasamo (4,182ft.), which is in Orissa.

The province thus includes (a) the alluvial plain between Nepal and the Ganges (North Behar); (b) the Son valley and the northward slopes of the plateau (South Behar); (c) the plateau and forested valleys of Chota Nagpur; (d) and the inland forested hills of the feudatory states of Orissa as well as (e) the coastal alluvium of Orissa, with a teeming population but serious flood dangers due to the fact that deposit of silt has lifted the rivers above the general level of the land.

Climate.—The climate depends on the province's position on the western side of the head of the Bay of Bengal with the summer monsoon blowing in and turning up the Ganges valley. Sea breezes become important on the Orissa coast by May and the average temperature, though high, is less so than farther west in central India, altitude for altitude. The plateau and hills accumulate cloud in the day time and dissipate it at night, and this limits rises of temperature to some extent. Nine-tenths of the total rainfall comes from the summer monsoon between June and October, the cool dry season is delightful in Behar but much less marked in Orissa where, at Puri, the temperature ranges only from 77° to 86°, while in Behar, though in the hot season the temperature may rise to 118°, the average night temperature is 57° and the lowest recorded 34°. Total rainfall in Orissa is about 59in., in Chota Nagpur 53in., in South Behar (somewhat in a rain-shadow) 44in., and at Purnea, north-east Behar, 68 inches. Chilka lake, in Orissa, the only one in the province, has an area of 344sq.m. in the dry, and 450sq.m. in the rainy season.

People.—The contrasts in peoples and civilizations are as marked as those in physical geography. The Khonds of the Khondmals (in Angul) offered human sacrifices till 1847 and since that time buffaloes have been substituted for human victims, and the Khonds have found the earth-goddess easily propitiated. In 1899–1900 the Mundas and Oraons rose under Birsa, believed to be an incarnation of the deity, whose followers alone would escape universal destruction by flood and in the meantime be proof against rifle fire. Since then Christianity has spread owing to missionary efforts and there are now nearly 200,000 converts in this district. Again, in 1917 an act was passed establishing a university at Patna, and three years later another act prohibited a species of serfdom found in some areas. Behar contains a race of sturdy agriculturists with the same social organization as the people of the United Provinces. Their language is Bihari, which the Hindus call Hindi and the Mohammedans Urdu. In Orissa the distinct race of Oriyas is found, speaking the Oriya language, which is of an archaic type, both in form and vocabulary, and was written till little over a century ago on strips of palm leaves with an iron stylus. They are mainly Hindus and long isolation from the rest

of India—railway communication was not established till 1899—has helped to preserve their cult and caste-system, and they are devout Vaishnavas, whose reverence is concentrated on Jagannath. The Chota Nagpur plateau, on the other hand, is the home of various groups of descendants of the earliest known inhabitants of India, many of whom still use bows and arrows. Physically they are distinguished by short stature, black skins, long heads and broad, almost negritic, noses. The chief peoples are the Santals, Oraons, Mundas, Hos, Khonds, Kharia, Bhumij and Maler or Sauria Paharids. They have retained very numerous tribal dialects, and the animistic beliefs and practices of their primitive ancestors are still prevalent among them. Of the total population 83% are Hindus; 9% are Mohammedans, of whom one-fourth are resident in Purnia; 6% are Animists, nearly all in the Chota Nagpur plateau, which also contains 284,000 of the 303,000 Christians found in the province. Nearly half (147,000) are Roman Catholics, 96,000 are Lutherans and 35,000 are converts to Anglican missions. Chota Nagpur is sparsely populated, but every available acre of land is under cultivation in Behar, while the deltaic portion of Orissa is also thickly populated. The density of the rural population rises in parts of Behar and in the central parts of Orissa to 1,000 to the square mile. As a result of pressure on the soil emigration is active. Excluding contiguous parts of other provinces, it was found at the census of 1921 that nearly 2 million inhabitants of Behar and Orissa had left the province since the last census. The great majority, however, are only temporary migrants, who go to earn the wages of labour in industrial and other centres when their crops are off the ground and return to their homes when active cultivation recommences.

Agriculture.—No less than four-fifths of the population is supported by agriculture. The staple crop is rice, which occupies nearly half the cultivated area. The alluvial plains of both Behar and Orissa are the chief centres of cultivation, but rice is also grown in the Chota Nagpur plateau, both on terraces laboriously cut out of the slopes and in depressions between the ridges. The chief harvest is that of winter rice; about one-quarter consists of autumn rice. The next most important food-crops are wheat, barley, maize and grain, all spring crops occupying one-fifth of the area under cultivation. Another one-fifth is devoted to other food grains, such as pulses, and to fodder crops. The balance is under oil-seeds, sugar cane, tobacco and minor crops. Jute is of importance only in Purnea where it is grown on 250,000 acres. Tobacco is cultivated chiefly in North Behar. The cultivation of indigo, once extensive in the latter area, has declined owing to the competition of the synthetic dye, the area under its cultivation fell from 270,000 acres in 1900–01 to 110,000 acres ten years later, and was reduced to 13,000 acres in 1925–26. The rainfall is normally ample for the crops, but it is sometimes capricious and unevenly distributed. The Orissa canal system affords an insurance against consequent crop failures in the seaboard districts of Orissa, the Sonal canal system in Shahabad and part of Gaya and the Tribini and Dhaka canals in Champaran.

Mines and Manufactures.—The two sub-provinces of Behar and Orissa are almost entirely agricultural, but the Chota Nagpur plateau is extremely rich in natural resources. There are no fewer than 8 coalfields, viz., the Jharia field and part of the Rani-ganj field in Manbhum, the Bokaro field near the west end of Jharia, the Giridih, Karanpura and Ramgarh fields in Hazaribagh, the Daltonganj field in Palamau and the Talcher field, called after the State of that name. Coal mining is by far the most important of the large organized industries of the province. There were 441 mines in 1925 with an output of 13,800,000 tons of coal. Over 10½ million tons were raised in the Jharia field, 1½ million tons in the Bokaro field and 750,000 tons in the Giridih field, where the mines are owned and worked by the East Indian railway. The Karanpura and Talcher fields are expected to develop rapidly with the extension of railway communications. A belt of mica, 60m long by 12 to 14m broad, runs through the districts of Gaya, Hazaribagh and Monghyr and produces about half the world's supply of mica. A belt of copper deposits extends for a distance of about 80m. in the Singhbhum district; a mine opened in 1913 has reached a depth of 1,100 feet. The most im-

portant deposits of iron ore in India are situated in the same district and in the Feudatory States: the output in 1925 was 1,434,000 tons out of a total output of 1,545,000 tons for the whole of India. Nearly a million tons were produced in Mayurbhanj, where the Tata Iron and Steel Co. have workings at Gurumaishini hill and the remainder in Singhbhum. Gold, chromite and apatite occur in the same district, manganese ore both there and in Gangpur, and bauxite in Ranchi and Palamau. Slate is quarried in the hills of the Monghyr district and limestone (with an output of nearly a million tons in 1925) in the Kaimur hills of Shahabad.

Next to coal mining, metallurgical industries are the most important owing to the establishment at Jamshedpur of the Tata Iron and Steel Co., which employs directly over 25,000 persons and in 1925-26 produced 470,000 tons of steel, 573,000 tons of pig iron and 139,000 tons of rails and beams. Subsidiary industries have been established in Jamshedpur and its neighbourhood, e.g., the manufacture of tin-plates, cables, wire, etc. The workshops of the East Indian railway at Jamalpur, near Monghyr, employ over 11,000 hands, and at Monghyr itself there is a large factory with about 3,000 hands for the manufacture of cigarettes. In spite of a temporary revival during the World War the manufacture of indigo has been nearly destroyed by the competition of the artificial dye, but sugar has largely taken its place and large factories, with up-to-date machinery for making white sugar, have been established in North Behar; nearly 23,000 tons of white sugar were produced in 1925-26.

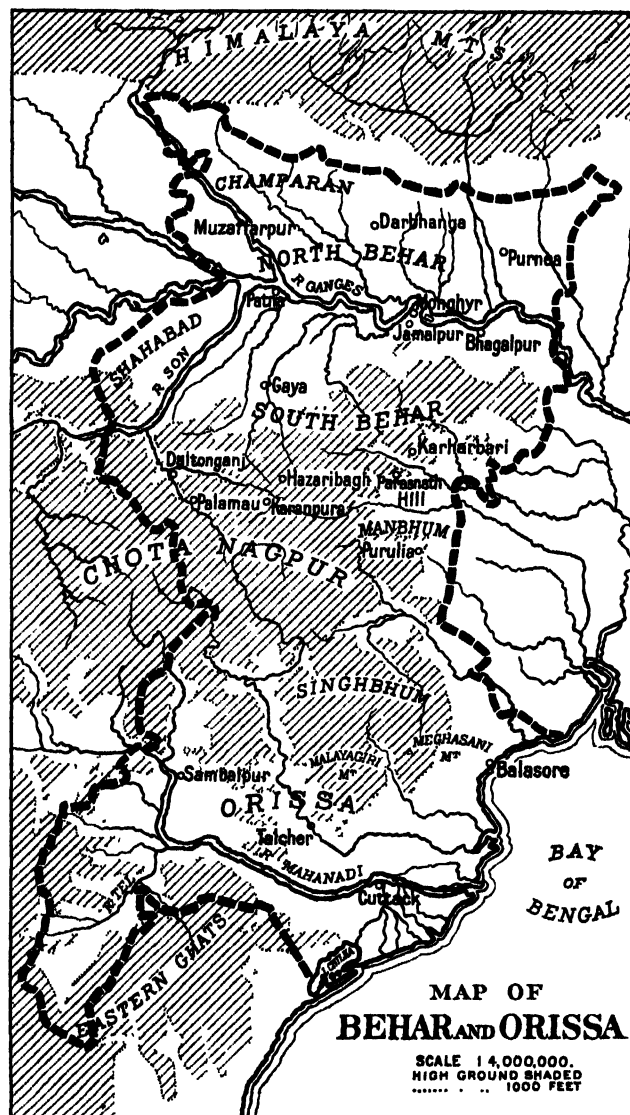

Shellac is made from tar in Chota Nagpur. Saltpetre was formerly produced on a large scale in Behar, but the industry has suffered from the artificial product of the nitrates of South America and the development of German potash deposits. Of the cottage industries, handloom weaving, which supports nearly half a million persons, is still *facile princeps* in spite of the imports of cheap piece-goods.

Railways.—South Behar is served by the East Indian railway, which also traverses Chota Nagpur, and North Behar by the Bengal and North-Western railway, which at Katihar establishes connection with the Eastern Bengal State railway. The Bengal-Nagpur railway runs through Orissa, which is thus linked with Calcutta and Madras, and has also branches to Ranchi and the coalfields. These railways have Calcutta as the centre of their system and direct railway communication between Behar and Orissa has hitherto been lacking. Large schemes of railway extensions which centre on the coalfields have been undertaken of late years and will do much to open up Chota Nagpur. The Talcher line, completed at the end of 1926, connects the Talcher field, and some of the Feudatory States, hitherto difficult of access, with the Bengal-Nagpur line from Calcutta to Madras. The Barkakhana-Chandil Chord line gives the Karanpura field an outlet to Jamshedpur and the south. The Central India coalfields railway will open up that field and the Bokharo field, providing an outlet on the west, where it will connect with Daltonganj and by the East Indian Railway line with the whole railway system to Bombay.

Commerce.—Calcutta is the centre of both the import and export sea-borne trade. The province has no ports worthy of the name: Chandbali in Orissa is a place of call for small coasting steamers, but the trade is small and the imports all come from Calcutta. A chamber of commerce for the province was created in 1925-26, but there are no commercial centres of first-rate importance. Patna was formerly an entrepôt, but trade now passes through it on its way to and from Calcutta and it is no longer a large collecting and distributing centre. Similarly other towns supply their rural surroundings with such articles as cloth, salt and kerosene oil and receive their surplus crops for transport by the railway.

Administration.—The province is administered by a governor acting with an executive council of two members and with two ministers. The chiefs administer in the Feudatory States, with the guidance of a political officer and under the general supervision of the governor acting as the agent of the governor-general. The legislative council consists of 103 members, of whom 76 are elected. For general administrative purposes the Province is divided into 21 districts which are grouped in 5 divisions, viz.,

Patna, Tirhut, Bhagalpur, Chota Nagpur and Orissa. The provisions of the act empowering the legislative council to make laws do not apply to the district of Angul and apply only in a modified form to the Chota Nagpur division and the districts of Sambalpur and the Santal Parganas, which in this connection are known as "backward tracts." The want of uniformity which has been remarked elsewhere characterizes the revenue administration. Land revenue in Behar and Chota Nagpur is permanently settled,

THE PROVINCE OF BEHAR IS FAMOUS IN BOTH THE POLITICAL AND RELIGIOUS HISTORY OF INDIA. GAUTAMA, THE FOUNDER OF BUDDHISM, PREACHED IN MAGADHA IN THE REIGN OF BIMBISARA ABOUT 528 B.C. AND BUDDHIST MISSIONARIES SET OUT FROM BEHAR FOR THE CONVERSION OF CHINA, CEYLON, TIBET, AND TARTARY. BEHAR CAME INTO THE POSSESSION OF THE EAST INDIA COMPANY IN 1765 WHEN IT WAS UNITED WITH BENGAL.

but in Orissa temporary settlements are made; and there are six Tenancy Acts regulating the relations of landlord and tenant.

See *Bihar and Orissa: First Decennial Review, 1912-22* (Patna, 1923); B. A. Collins, *Bihar and Orissa in 1925-26* (Patna, 1927).

HISTORY

The province of Behar corresponds to the ancient kingdom of Magadha, which comprised the country now included in the districts of Patna, Gaya and Shahabad, south of the Ganges. The origin of this kingdom, famous alike in the political and religious history of India, is lost in antiquity. The first authentic dynasty is that of the Saisunaga, founded by Sisunaga (c. 600 B.C.), whose capital was at Rajagaha (Rajgir) in the hills near Gaya; and the first king of this dynasty of whom anything is known was Bim-

bisara (c. 528 B.C.). It was in the reign of Bimbisara that Vardhamana Mahavira, the founder of Jainism, and Gautama, the founder of Buddhism, preached in Magadha, and Buddhist missionaries issued thence to the conversion of China, Ceylon, Tibet and Tartary. To this day Behar remains a sacred spot in the eyes of Buddhist nations.

Bimbisara was murdered by his son Ajatasatru, who succeeded him, and whose bloodthirsty policy reduced the whole country between the Himalayas and the Ganges under the suzerainty of Magadha. The remaining history of the dynasty is obscure. A son of Mahapaoma Nanda, a usurper, was reigning at the time of the invasion of Alexander the Great (326 B.C.), who was informed that the king of Magadha could oppose him with a force of 20,000 cavalry, 200,000 infantry, 2,000 chariots, and 3,000 or 4,000 elephants. In 321 B.C. Chandragupta Maurya seized the throne, which his dynasty occupied for 137 years (see *INDIA: History*). After the death of the great Buddhist king, Asoka (c. 231), the Maurya empire began to break up, and it was finally destroyed about 50 years later by Pushyamitra Sunga. Descendants of Asoka continued, however, to subsist in Magadha as subordinate rajas for many centuries. The reign of Pushyamitra, who held his own against Menander and succeeded in establishing his claim to be lord paramount of northern India, is chiefly notable as marking the beginning of the Brahmanical reaction and the decline of Buddhism. The Sunga dynasty, which lasted 112 years, was succeeded by the Kanva dynasty, which after 45 years was overthrown (c. 27 B.C.) by the Andhras or Satavahanas. In A.D. 236 the Andhras were overthrown, and, a century later (A.D. 320), Chandragupta I. established his power at Pataliputra and founded the famous Gupta empire (see *GUPTA*), which survived till it was overthrown by the Ephthalites (*q.v.*), or White Huns, at the close of the 5th century. In Magadha itself the Guptas continued to rule as tributary princes for some centuries longer. About the middle of the 8th century Magadha was conquered by Gopala, who founded the imperial dynasty known as the Palas of Bengal. They were zealous Buddhists, and under their rule Magadha became once more an active centre of Buddhist influence. Gopala built a great monastery at Udandapura, or Otantapuri, which has been identified by Sir Alexander Cunningham with the city of Behar, where the later Pala kings established their capital. Under Mahipala (c. 1026), the ninth of his line, and his successor Nayapala, missionaries from Magadha succeeded in re-establishing Buddhism in Tibet.

In the 11th-century the Pala empire was partly dismembered by the rise of the "Sena" dynasty in Bengal; and at the close of the 12th century both Palas and Senas were swept away by the Mohammedan conquerors, the city of Behar itself being captured in 1193 in a surprise attack by the Turki free-lance Mohammed-i-Bakhtyar Khilji, with a party of 200 horsemen. "It was discovered," says a contemporary Arab historian, "that the whole of the fortress and city was a college, and in the Hindi tongue they call a college Bihar." Most of the monks were massacred, and those who survived were scattered. Buddhism in Magadha never recovered: it lingered awhile in obscurity and then vanished completely.

Behar now came under the rule of the Mohammedan governors of Bengal. About 1330 the southern part was annexed to Delhi, while north Behar remained for some time longer subject to Bengal. In 1397 the whole of Behar became part of the kingdom of Jaunpur; but a hundred years later it was annexed by the Delhi emperors, by whom—save for a short period—it continued to be held. Behar came into the possession of the East India Company in 1765, when the province was united with Bengal. In 1857 two zemindars, Umar Singh and Kumār Singh, rebelled against the British Government, and for some months held the ruinous fort of Rohtās against the British.

See *Imperial Gazetteer of India* (1908), s.v. "Bihar" and "Bengal"; Aryangar, *Ancient India* (1911); V. A. Smith, *Early History of India* (revised by S. M. Edwardes, 1924), and *Oxford History of India* (1919).

BEHAR or **BIHAR**, a tract in British India, forming part of the province of Behar and Orissa. Behar, extending across the valley of the Ganges from the frontier of Nepal to the hills of

Chota Nagpur, corresponds to the three administrative divisions of Patna, Tirhut, and Bhagalpur (excluding the Santal Parganas) with a total area of 36,898sq.m.; and pop. (1921) of 21,580,548. The general aspect of the country is flat, except in the north of Champaran, where the Sumeswar and Dun hills abut upon the plain, in Shahabad, where the Kaimur hills rise in a rocky plateau, and in the districts of Gaya, Monghyr and Bhagalpur, where outliers of the Chota Nagpur plateau are found. A densely populated tract, it was formerly liable to famine; but it is now well protected by railways and in some parts by canals.

Behar derives its name from the town of Behar, now a sub-divisional headquarters in the Patna district, and the latter took its name from a great Buddhist *Vihara* or monastery established there in the 9th century A.D. Behar was the capital of Magadha (South Behar) under the Pata kings and continued to be the capital under Mohammedan governors until the 16th century, when the seat of government was transferred to Patna.

BEHĀ UD-DĪN (ABŪ-L-MAḤĀSIN YŪSUF IBN RĀF T' IBN SHADDĀD BEHĀ UD DĪN) (1145–1234), Arabian writer and statesman. He was at first a teacher in the Nizāmiyya at Baghdad and then professor at Mosul. In 1187, after making the pilgrimage to Mecca, he visited Damascus. Saladin, who was at the time besieging Kaukab (a few miles south of Tiberias), sent for him and became his friend. Behā ud-Dīn observed that the monarch was engrossed by the war which he was then waging against the enemies of the faith, and sought his favour by urging him to its vigorous prosecution. With this view he composed a treatise on *The Laws and Discipline of Sacred War*, which he presented to Saladin. From this time he remained constantly attached to the person of the sultan, and was employed on various embassies and in departments of the civil government. He was appointed judge of the army and judge of Jerusalem. After Saladin's death Behā ud-Dīn remained the friend of his son Malik uz-Zāhir, who appointed him judge of Aleppo. Here he employed some of his wealth in the foundation of colleges. When Malik uz-Zāhir died, his son Malik ul-'Aziz was a minor, and Behā ud-Dīn had the chief power in the regency, using it for the patronage of learning. He lived in retirement after the abdication of Malik ul-'Aziz. His chief work is his *Life of Saladin* (English trans. the Palestine Pilgrims' Text Society, London, 1897).

For list of other extant works see C. Brockelmann, *Geschichte der arabischen Litteratur* (Weimar, 1898), vol. i. pp. 316 f.

BEHĀ UD-DĪN ZUHĀIR (ABŪ-L-FAḤL ZUHĀIR IBN MOḤAMMED AL-MUHALLABĪ) (1186–1258), Arabian poet, became celebrated as the best writer of prose and verse and the best calligraphist of his time. His poetry consists mostly of panegyric and brilliant occasional verse distinguished for its elegance. It has been published with English metrical translation by E. H. Palmer (1877).

His life was written by his contemporary Ibn Khallikān (see M'G. de Slane's trans. of his *Biographical Dictionary*, vol. i pp. 542–545).

BEHAVIOURISM is a direct outgrowth of studies in animal behaviour during the first decade of the 20th century. C. Lloyd Morgan, the British psychologist, must be looked upon as the founder, virtually, of the American school of animal psychology. His books, *Introduction to Comparative Psychology* (1894) and *Animal Behaviour* (1900), broke away from the traditional anthropomorphic interpretations of animal acts. He first emphasized the necessity of tracing all the steps in any act we see the animal performing before the interpretation of that act becomes possible. His actual experiments upon the learning of animals were few in number but rich in interpretative value. His studies emphasized the trial and error nature of all animal learning. Morgan's work undoubtedly inspired the American animal psychologist, E. L. Thorndike, who first instigated systematic experimentation upon chicks, dogs, cats and monkeys in the United States. There soon followed in that country a host of experimentation upon mammalian learning. We mention in passing the work of Small, Yerkes, Kinnaman, Davis, Allen, Porter, Carr, Franz, Johnson, Ulrich, Richardson, Yoakum, Haggerty and Watson.

The rich results coming from the study of infra-human mani-

mals led to similar studies on man. During this same general period we find man studied for the first time as a member of the animal kingdom. We mention the work of E. J. Swift, W. F. Book, H. A. Ruger and K. S. Lashley. Acquisitions of skilful acts such as keeping three balls in the air, typewriting, solving mechanical puzzles, learning to shoot the English long bow, serve to illustrate the types of problems studied. The results of these human studies emphasized the *essential similarity between human and infra-human learning*.

Emergence of Behaviourism.—Up to the appearance of Watson's two papers, "Psychology as the Behaviourist Views It" (1913) and "Image and Affection in Behaviour" (1913), and his book *Behaviourism—An Introduction to Comparative Psychology* (1914), there was no crystallization of the behaviouristic trend. None of the workers in the field of animal behaviour made any attempt to escape the implications of consciousness in their interpretation of human or animal acts. In these three publications the terms "behaviourism," "behaviouristic" and "behaviourist" were first used. Mrs. Washburn's book, *The Animal Mind* (1907), represents very well the tendency of the time. She felt the need of interpreting all animal behaviour in terms of consciousness as defined in the introspective systems of W. Wundt and E. B. Titchener.

"Behaviourism when first conceived was based largely upon the rather loose concept of habit formation. The work of Pawlow and his students on the conditioned reflex, while known to the behaviourists, played at first a relatively minor rôle in their formulations. This was due to the fact that his experiments were chiefly concerned with conditioned glandular reflexes, which at that time was a subject hardly touched upon by psychologists. Bechterew's work on the conditioned motor reflex, where human subjects were used, had from the first a very much greater influence upon behaviourism. The work of Lashley in conditioning the human salivary reflex and of Watson and Rayner on conditioning human emotional reaction (fear) showed the great range of application of the conditioned reflex methods to human behaviour. This work has led to an attempt to formulate all habit (organization) in terms of conditioned glandular and motor reaction. In spite of the fact that behaviourism did not at first utilize to any extent the conditioned reflex methods, Pawlow and Bechterew must be looked upon as furnishing the keystone to its arch. During the period of the general formulation of behaviourism as a system rather than as an approach to psychology, or as a specialised method in psychology, the writings of E. B. Holt, A. P. Weiss and K. S. Lashley are noteworthy."

THE FUNDAMENTAL VIEWPOINT

The behaviourist takes the position at the outset that the total behaviour of man from infancy to death is the subject-matter of (human) psychology. Behaviour can be observed like the phenomena of all other natural sciences; e.g., chemistry, physics, physiology or biology. The same general types of methods used in the natural sciences can be used in behaviour psychology. So far in his objective study of man no behaviourist has observed anything that he can call consciousness, sensation, perception, imagery or will. Not finding these so-called mental processes in his observations, he has reached the conclusion that all such terms can be dropped out of the description of man's activity.

All behaviouristic observations apparently can be presented in the form of stimulus and response. The simple schema used is $\rightarrow R$. A behaviouristic problem is solved when both the stimulus and the response are known. For a very simple example, substitute in the above formula for S, contact on the cornea, and for R, blinking. The behaviourist's problem is solved when this has been done as a result of verified controlled experimentation. The neurologist has a problem to solve in this same phenomenon, namely, in determining the neural connections involved, their course, their numbers, the timing and spread of the neural impulse, etc. The behaviourist does not encroach upon it. The physical chemist has a problem to solve here also. His problem is not encroached upon either by the behaviourist or by the neurologist.

His problem is the determination of the physical and chemical nature of the neural impulses, the amount of work done in the

reaction and the like. In every human reaction there is thus a behaviourist's problem; a neuro-physiological problem and a physico-chemical problem. When the phenomena of behaviour are once accurately formulated in terms of stimulus and response, the behaviourist achieves predictability with reference to his phenomena and control over them—the two essentials every science demands. One might put it in another way. Suppose the behaviourist were given the problem of how to cause a human being to blink, he solves it by touching the cornea with a hair (control). In more complicated reactions, especially those labelled "social" the $S \rightarrow R$ relationships are not so easy to solve. For example, present the stimulus prohibition (S) to any given nation, what will the response (R) be? It may take years to determine R completely. Many behaviouristic problems have to wait for their solution upon the slow experimentation of science as a whole. Regardless of how complicated the stimulus-response relationships may be, the behaviourist does not admit for a moment that any human reactions cannot be so described.

The general goal of behaviourism, then, is to so amass observations upon human behaviour that in any given case, given the stimulus (or better situation), the behaviourist can predict in advance what the response will be; or, given the response, he will be able to state what situation is calling out the reaction. Looked at in this broad way, it is easy to see that behaviourism is far away from its goal. But while its problems may be difficult, they are not insuperable. The one thing that makes the approach of the behaviourist difficult is the fact that stimuli not at first calling out any given response can come later to call out a specified type of response. We call this a process of *conditioning* (earlier called habit formation).

THE GENETIC METHOD

This difficulty forces the behaviourist to resort to the genetic method. He takes the infant at birth and surveys his so-called physiological system of reflexes or, better, embryological responses. Having taken this inventory of unconditioned, unlearned responses, he next begins to try to condition them. When this has been done, two striking facts seem to appear. First, the number of complicated unlearned responses appearing at birth or at intervals thereafter is relatively small. *This leads to the rejection of the whole concept of instinct.* Most of the complex responses that the older psychologists called instinctive, such as crawling, climbing, cleanliness, fighting (a long list), are now believed to be built in or conditioned. In other words, the behaviourist no longer finds support for hereditary patterns of behaviour nor for special abilities (musical, art, etc.) which are supposed to run in families. He believes that given the relatively simple list of embryological responses which are fairly uniform in infants, he can build (granting that both internal and external environment can be controlled) any infant along any specified line—into rich man, poor man, beggar man, thief.

How the Building Takes Place.—Suppose one assumes that there are present at birth only 100 unconditioned embryological responses—there are many more of course. These appear in the form of breathing, crying, movements of arms, legs, fingers, toes, trunk, defaecation, urination and the like. If we assume that all of these can be conditioned and integrated according to the law of permutation and combination, the total possible number of built-in responses would be factorial 100—many millions more than any adult, even the most versatile one, is ever called upon to make even in the most complex social environment.

These embryological responses do not appear haphazard—they are not "random." Some definite stimulus calls them out. Let us call all such stimuli unconditioned stimuli, (U)S. Let us call all such responses unconditioned responses (U)R. The formula could be expressed thus:—

$$\begin{array}{ccc} \frac{(U)S}{A} & \rightarrow & \frac{(U)R}{I} \\ \text{After conditioning} & & \left. \begin{array}{l} B \\ C \\ D \\ E \\ \text{Etc.} \end{array} \right\} \rightarrow I \end{array}$$

In the schema A is such an unconditioned stimulus and \mathbf{r} is such an unconditioned response. Now if the experimenter takes B—and B so far as is known may be any object in the universe—and lets it stimulate the organism simultaneously with A for a certain number of times (sometimes even once is enough) it thereafter will also arouse \mathbf{r} . In the same way one can make C, D, E call out \mathbf{r} ; in other words, one can make any object at will call out \mathbf{r} (stimulus substitution). This shows how the stimulus side of our life gets more and more complicated as life goes on. In a similar way reactions become complicated as soon as a simple stimulus through the process of conditioning comes to call out a chain of reflexes (integration). In this way the behaviourist tries to take the vague concept of habit formation and to give it a new and exact scientific formulation in terms of conditioned responses. On this basis the most complicated of our adult habits are explicable in terms of chains of simple conditioned responses.

The simplification in psychological theory which comes through the application of behaviouristic principles is best seen in the realm of the emotions. Take fear. The works of Watson and Rayner, Moss, Lecky, Jones and others have shown that the fundamental unconditioned stimulus (U)S calling out a fear reaction is a *loud sound or loss of support*. Every child with only one exception, of approximately 1,000 infants examined, was found to catch his breath, pucker his lips, cry or, if older, crawl away, when a loud sound was given behind his head or when the blanket on which he was lying was suddenly jerked. Nothing else so far observed will produce the fear response in early infancy. Now it is very easy to make the child fear any other object in the universe. All the experimenter has to do is to show the object and strike the steel bar behind his head and repeat the procedure for a few times. The schema of this situation follows.—

(U)S	(U)R
Loud sound	"Start," crying, etc. (fear)
Loss of support	
After conditioning.	
(C)S	(C)R
Rabbit, dog, furry objects	Fear

Conditioning of the emotions (fear, rage, love, etc.) takes place very much earlier in the life of the infant than has hitherto been supposed; it is a process that brings complexity in response at a rapid rate. This means that an infant two or three years of age is already shot through with thousands of responses built up by the environment in which it lives.

The Process of Unconditioning.—The experiments of the behaviourists have shown that there is not only a process of conditioning or building taking place constantly from birth to death, but that there is also a process of *unconditioning* taking place as well. A simple experiment of the type described below best illustrates it. A conditioned negative response was set up in a 1½ year-old child—that of drawing back from or running away from a bowl containing gold fish. We quote from a recent experiment:

"The child, the moment he sees the fish bowl, says 'bite.' No matter how rapid his walk, he checks his step the moment he comes within seven or eight feet of the fish bowl. If I lift him by force and place him in front of the bowl, he cries and tries to break away and run. No psychoanalyst, no matter how skilful, can remove this fear by analysis. No advocate of reasoning can remove it by telling the child all about beautiful fishes, how they move and live and have their being. As long as the fish is not present, you can by this verbal organization get the child to say 'Nice fish, fish won't bite'; but show him the fish and the old reaction returns. Try another method. Let his brother, aged four, who has no fear of fish, come up to the bowl and put his hands in the bowl and catch the fish. No amount of watching a fearless child play with these harmless animals will remove the fear from the toddler. Try shaming him, making a scapegoat of him. Your methods are equally futile. Let us try, however, this simple method. Get a table 10 or 12 ft. long. At one end of the table place the child at meal time, move the fish bowl to the extreme other end of the table and cover it. Just as soon as the meal is placed in front of him, remove the cover from the bowl. If dis-

turbance occurs, extend your table and put the bowl still farther away, so far away that no disturbance occurs. Eating takes place normally, nor is digestion interfered with. The next day repeat the procedure but move the bowl a little nearer. In four or five such sessions the bowl can be brought close to the food tray without causing the slightest bit of disturbance."

The behaviourist concludes that by his experiments upon the conditioning and unconditioning of the responses of infants and children he has obtained a clear view of the way human beings are built up by the environment in which they find themselves. Man is a biological unit that can be studied like any other animal.

Does Thinking Offer Any Problem?—Many introspective psychologists agree up to this point with the behaviourist (Bertrand Russell, for example), but the subjectivist claims that there is something new in thinking (and let us include "imagination" under this term). What has the behaviourist to offer on thinking? The behaviourist's formulation runs somewhat as follows—

The increasing dominance of language habits in the behaviour of the developing child leads naturally over into the behaviourist's conception of thinking. The behaviourist makes no mystery of thinking. He holds that thinking is behaviour, is motor organization, just like tennis playing or golf or any other form of muscular activity. But what kind of muscular activity? The muscular activity that he uses in talking. Thinking is merely talking, but talking with concealed musculature.

"Take any child when he first begins to talk. Peep through the keyhole and watch him in the early morning. He will sit up in bed with his toys, talk aloud to his toys, talk about them. When a little older, he will plan out his day aloud, say aloud that his nurse is going to take him for a walk, that his daddy is going to bring him a car. In other words, he talks overtly when alone just as naturally as he works overtly with his hands. A social factor comes in. The father gets to the point where his own morning nap is disturbed. He yells out, 'Keep quiet.' The child begins then to mumble to himself—a great many individuals never pass this stage, and they mumble to themselves all through life whenever they try to think. The father does not like the child's mumbling any better than his talking aloud, and so he may slap him on the lips. Finally, the parents get the child to the point where he talks silently to himself. When his lips are closed, it is nobody's business what is going on below. Thus we come to behave as we please if we do not give any external motor sign of it—in other words, our thoughts are our own."

A further question comes up for serious consideration: Do we think only in terms of words?

"The behaviourist takes the position to-day that whenever the individual is thinking, the whole of his bodily organization is at work (implicitly)—even though the final solution shall be a spoken, written or subvocally expressed verbal formulation. In other words, from the moment the thinking problem is set for the individual (by the situation he is in) activity is aroused that may lead finally to adjustment. Sometimes the activity goes on (a) in terms of implicit manual organization; (b) more frequently in terms of implicit verbal organization; (c) sometimes in terms of implicit (or even overt) visceral organization. If (a) or (c) dominates, thinking takes place without words."

Words are thus the conditioned (C)S substitutes for the world of objects and acts. Thinking is a device for manipulating the world of objects when those objects are not present to the senses. Thinking more than doubles human efficiency. It enables the individual to carry his day world to bed with him and manipulate it at night or when it is a thousand miles away.

Strict behaviourism is making rapid progress in America. It, however, has not yet been universally accepted even here. The older subjective psychology is being profoundly modified by it. One sees very little of *introspection* and still less of *imagery* in the writings of the subjectivists.

See J. B. Watson, "Psychology as the Behaviourist Views It," *Psych. Rev.* xx. (1913); *Behaviourism* (1925), the articles by K. S. Lashley in the *Psych. Rev.* in 1925; A. P. Weiss, *A Theoretical Basis of Human Behaviour* (1925); George A. Dorsey, *Why We Behave Like Human Beings* (1925); Bertrand Russell, *Analysis of Mind*; C. D. Broad, *Mind and its Place in Nature* (1926). (J. B. W.)

BEHBEHAN, a town of Persia, 30° 35' N., 50° 19' E., in the western part of the province of Fars, pleasantly situated in the midst of a cultivated plain, some 150m. west-north-west of Shiraz and about 5m. south of the Marun or Kurdistan river. Formerly a very flourishing and important city, it is now greatly shrunken and decayed. The present population is about 15,000–20,000. It is on the route from Bandar Dilam to Isfahan, which is shorter, and in summer, easier than any other route. A motor road connects Behbahan with Ahwaz and the mule track from Behbahan to Shiraz could be made fit for wheels with little difficulty.

Close to Behbahan lie the ruins of the ancient and famous city of Arrajan, and of two magnificent bridges, one of which consisted of a single arch 80 paces in span and of almost equal height. It is referred to in a contemporary chronicle of Ibn Babūta as the finest in the world. Several of the piers of the other bridge are still standing. Not far off are the ruins of an even older town, near which was one of the principle fire temples of the Persians.

BEHEADING, a mode of executing capital punishment. It was in use among the Greeks and Romans, and the former, as Xenophon says at the end of the second book of the *Anabasis*, regarded it as a most honourable form of death. So did the Romans, by whom it was known as *decollatio* or *capitis amputatio*. The head was laid on a block placed in a pit dug for the purpose—in the case of a military offender, outside the entrenchments; in civil cases, outside the city walls, near the *porta decumana*. Before execution the criminal was tied to a stake and whipped with rods. In earlier years an axe was used; afterwards a sword, which was considered a more honourable instrument of death and was used in the case of citizens (*Dig.* 48, 19, 28). It was with a sword that Cicero's head was struck off by a common soldier.

Beheading is said to have been introduced into England from Normandy by William the Conqueror. The first person to suffer was Waltheof, earl of Northumberland, in 1076. An ancient ms. relating to the earls of Chester states that the serjeants or bailiffs of the earls had power to behead any malefactor or thief, and

AFTER A CONTEMPORARY PRINT

THE EXECUTION OF THE EARL OF STRAFFORD AT LONDON, MAY 12, 1641
Large crowds assembled on Tower Hill to see the execution of Strafford, who behaved with great composure and refused even to have his eyes bandaged. On the scaffold with him were Dr. Usher, Primate of Ireland, the city magistrates, and many of his friends

gives an account of the presenting of several heads of felons at the castle of Chester by the earl's serjeant. It appears that the custom also attached to the barony of Malpas. The liberty of Hardwick, in Yorkshire, was granted the privilege of beheading thieves. (*See* GUILLOTINE.)

But beheading was usually reserved for offenders of high rank. From the 15th century onward the victims of the axe include some of the highest personages in the kingdom. Simon, Lord Lovat was the last person beheaded in England (April 9, 1747). The execution of Anne Boleyn was carried out not with the axe,

but with a sword, and by a French headsman specially brought over from Calais. In the case of the 4th Earl Ferrers (1760) his petition to be beheaded was refused and he was hanged.

Executions by beheading usually took place on Tower hill, London, where the scaffold stood permanently during the 15th and 16th centuries. In the case of certain State prisoners, e.g., Anne Boleyn and Lady Jane Grey, the sentence was carried out within the Tower, on the green by St. Peter's chapel.

Beheading was only a part of the common-law method of punishing male traitors, which was ferocious in the extreme. According to Walcot's case (1696), *I. Eng. Rep.* 89, the proper sentence was "quod . . . per collum suspendatur et vivus ad

BY COURTESY OF THE CONTROLLER OF HIS MAJESTY'S STATIONERY OFFICE

BLOCK AND AXE AT THE TOWER OF LONDON

The block dates from the 16th century. It was last used for the execution of Simon Fraser, Lord Lovat, in 1746. The axe dates from 1688

ears of the executioner. In 1814 the king was empowered by royal warrant to substitute hanging as the ordinary mode of executing criminals; but as late as 1820 in the case of the Cato Street conspiracy (33 Howell, *State Trials*, 1,566), after the traitors had been hanged as directed by the act of 1814, their heads were cut off by a man in a mask, whose dexterity led to the belief that he was a surgeon. Drawing and quartering were not abolished till 1870.

The block usually employed is believed to have been a low one, such as would be used for beheading a corpse. C. H. Firth and S. R. Gardiner incline to the view that such a block was the one used at Charles I.'s execution. The more general custom, however, seems to have been to have a high block over which the victim knelt. Such is the form of that preserved in the armoury of the Tower of London, which is undoubtedly the block upon which Lord Lovat suffered. The axe which stands beside it was used to behead him and the other Jacobite lords. On the ground floor of the King's House, at the Tower, is preserved the processional axe which figured in the journeys of State prisoners to and from their trials, the edge turned from them as they went, but almost invariably turned towards them as they returned to the Tower. The axe's head is 1ft. 8in. high by 10in. wide, and is fastened into a wooden handle 5ft. 4in. long. The handle is ornamented by four rows of burnished brass nails.

In Scotland they did not behead with the axe or with the sword, as under the Roman law and formerly in Holland and France, but with the maiden (*q.v.*).

Beheading is now very rare in European countries, most of which have abolished or abrogated by disuse capital punishment (*q.v.*), but it was practised very extensively by the Chinese warlords, especially by Sun Chuan-fang in Shanghai.

BEHEMOTH (the intensive plural of the Hebrew *b'hemoth*, a beast), the animal mentioned in Job xl., probably the hippopotamus. The modern use expresses the idea of a very large and strong animal.

BEHISTUN or **BISITUN**, a village at the foot of a precipitous peak some 1,700ft. high, in the Zangers range in Persia, on the

right bank of the Samas-Ab, a tributary of the Kerkha. The original form of the name (Bagistana, "place of the gods," or, "of God") has been preserved by the Greek authors Stephanus of Byzantium, and Diodorus (ii. 13). At the foot of this scarp passes the old road which led from Babylon to Ecbatana, and here it was that Darius I., king of Persia, engraved his great inscription in three kinds of cuneiform writing, in which he recounts the way in which, after the death of Cambyses, he killed the usurper Gaumata (in Justin, Gometes, the pseudo-Smerdis), defeated the numerous rebels, and restored the kingdom of the Achaemenidae. This inscription he carved some 500 ft. above the level of the spring which bubbles out at the foot of the mountain, and, although it is by no means inaccessible, to reach it demands a difficult climb up the precipitous rock-face. The lower part of the inscribed surface consists of three columns of Susian, and five of Persian, each about 11 ft. high, while above these is the sloping overhang of the Babylonian (over the Susian), and the magnificent sculpture (over the Persian) of the king putting his foot on the prostrate body of Gaumata, followed by his two ministers. In front of him are nine rebel chiefs with their hands bound behind them and a rope round their necks, and above them is the winged figure of the god Auramazda.

In 1835 Henry Rawlinson, then a young officer, turned his attention to deciphering the Persian cuneiform characters of the inscriptions at Elwend, near Ecbatana, and, unconsciously following the method employed by the German Grotefend at the beginning of the century, he assigned correct values to about a third of the alphabet. With the knowledge thus obtained he attacked the great inscription of Behistun, and by 1846 he had not only overcome the difficulty of scaling the rock, but had also succeeded in the extraordinary exploit of translating the whole of the ancient Persian inscription by applying his knowledge of other dialects to the words of the inscription on which his decipherment of the characters had allowed him to transliterate correctly, thus laying the foundation of the science of Assyriology. It was now only a matter of time to elucidate the Susian and Babylonian, the former yielding to the investigations of Hincks, Westergaard, De Saulcy and Norris, the latter to Rawlinson, Hincks, Oppert and Fox Talbot.

At the foot of the rock is a bas-relief of Gotarzes, the Parthian king (A.D. 46–50), with a Greek inscription (C.I.G. III., No. 4674; cf. Geiger and Kuhn, *Grundriss d. Iranischen Philologie*, ii. 504) which has been partly destroyed by an Arabic inscription, and about a quarter of a mile away is a rude monolith sculptured with figures in low relief, perhaps of Sassanian workmanship (Mann, *Globus*, lxxxiii., No. 21, 1903, 328; Williams Jackson, *Persia, Past and Present*, 210; King and Thompson, *Inscr. of Darius the Great*, xxv).

For the decipherment and description of these inscriptions of Darius, see Sir Henry Rawlinson, *Journ. R. Geog. Soc.* ix. (1839); *J. R. Asiatic Soc.* x. (1866), xiv. (1853), xv. (1855); *Archaeologia*, xxiv. (1852); Weissbach and Bang, *Die altpersischen Keilschriften* (1893); Weissbach, *Die Achaemenideninschriften zweiter Art* (1890); Bezold, *Die (babylonischen) Achaemenideninschriften* (1882); A. J. Booth, *The Discovery and Decipherment of the Trilingual Inscriptions* (1902); A. V. Williams Jackson, *J. Am. Or. Soc.* xxiv. (1903), and *Persia, Past and Present* (1906); L. W. King and R. C. Thompson, *The Inscription of Darius the Great at Behistun* (1907); and for an illustrated popular account, R. C. Thompson in Hammerton's *Wonders of the Past*, 555.

BEHN, APHRA (otherwise AFRA, APHARA or AYFARA) (1640–1689), British dramatist and novelist and the first Englishwoman to earn her living as a writer, was baptized at Wye, Kent, in 1640. Her father, John Johnson, was a barber. While still a child she was taken out to Surinam, then an English possession, from which she returned to England in 1658, when it was handed over to the Dutch. In Surinam Aphra learned the history, and acquired a personal knowledge of the African prince Oroonoko and his beloved Imoinda, whose adventures she has related in her novel, *Oroonoko*. She married a London merchant of Dutch extraction, named Behn. The wit and abilities of Mrs. Behn brought her into high estimation at court, and after her husband's death in 1666, Charles II. employed her on secret service in the Netherlands during the Dutch War. At Antwerp she successfully

accomplished the objects of her mission; and in the latter end of 1666 she wormed out of one Van der Aalbert the design formed by De Ruyter, in conjunction with the De Witts, of sailing up the Thames and burning the English ships in their harbours. This she communicated to the English court, but although the event proved her intelligence to have been well founded, it was at the time disregarded and she received no reward. A period of the utmost poverty followed—she was imprisoned for debt for a short time—and this led to her writing as a means of supporting herself. In 1670 her first play, *The Forc'd Marriage*, was produced, and was followed by a succession of dramas which continued till her death. She was most successful as a writer of witty and vivacious comedies, of which *The Rover* (1677 and 1681) is an excellent example; but her versatility, like her output, was immense. She was well read, and often adapted the works of the older dramatists, *The City Heiress*, based upon Middleton's *A Mad World, My Masters*, being a case in point; but although she frequently borrowed, some of her most notable triumphs were absolutely original. *The City Heiress* is of further interest as displaying another of her many interests: together with *The Roundheads* (1682), which is an attack on the Puritans, it represents the part she played in the political battle of the time. Although the dramas comprise the bulk of her work, her prose works of fiction are of equal interest from the point of view of literary history. *Oroonoko* exerted unquestionable influence on the development of the novel, and Macaulay, admitted that, in spite of the coarseness which disfigures her work, the best of Defoe was not beyond her reach. Besides plays and tales, she published translations and poems. She attained great popularity, and had become the centre of much scandal before her death in 1689. *The Widow Ranter*, based on the story of the rebellion of Stanley Bacon in Virginia was produced posthumously in 1690. Among others of her plays may be mentioned *Sir Patient Fancy* (1678) which shows the influence of her French reading, and the *Feigned Courtizans* of 1679.

See *The Works of Aphra Behn*, edited by Montague Summers (1915). *Plays written by the Late Ingenious Mrs. Behn* (1702; reprinted, 1871); also "Aphra Behn's Gedichte und Prosawerke," by P. Siegel in *Anglia* (Halle, vol. xxv., pp. 86–128, 320–385, 1902); and A. C. Swinburne's essay on "Social Verse" in *Studies in Prose and Poetry* (1894); V. Sackville West, *Aphra Behn* (1927).

BEHRING, EMIL VON (1854–1917), German bacteriologist and founder of immunology as a science. Behring began life as an army surgeon and became professor successively at Halle (1894) and Marburg (1895). In 1890, while working with the Japanese investigator Kitasato (q.v.) in the laboratory of Robert Koch at Berlin, he showed that it was possible to produce in an animal immunity against the disease known as tetanus, or lock-jaw, by injecting into it the blood serum of another animal infected with tetanus. The immunity was efficient against 300 times the fatal dose of tetanus. The paper of Behring and Kitasato contains for the first time the word antitoxic. Soon after, Behring showed that immunity could also be obtained against diphtheria by injecting serum from an animal that had previously been injected with living cultures of the diphtheria bacillus. This epoch making discovery was soon given practical application. It was found possible to induce a degree of immunity even after the onset of the disease. The first human case was a child in a clinic at Berlin in 1891. Diphtheria antitoxin was placed on the market in 1892. In a few years' time its administration had become a routine part of the treatment of the disease. Behring died at Marburg on March 31, 1917. He wrote, among other works, *Die Blutserumtherapie* (1892); *Ätiologie des Tetanus* (1904); *Einführung in die Lehre von der Bekämpfung der Infektionskrankheiten* (1912).

BEHRING, VITUS: see **BERING**.

BEILBY, SIR GEORGE THOMAS (1850–1924), British chemist, was born in Edinburgh Nov. 17 1850 and educated at the university there. He joined the Oakbank Oil Company in 1869,

and later became a director of the Cassel Cyanide Company, the Castner-Kellner Alkali Co., and many other important undertakings. He invented a new process for retorting oil shale, a new synthetic method of manufacturing alkaline cyanides, and also carried out much important work on the economical use of fuel, establishing the Fuel Research station at East Greenwich shortly before his death. Having served on several commissions and assisted the Government in an advisory capacity on many occasions, he was elected F.R.S. in 1906, and was knighted in 1916. He held office in many scientific societies, and was the author of a book on *The Aggregation and Flow of Solids* (1921) and of numerous papers on chemical and metallurgical subjects. He died at Hampstead, London, on Aug. 1 1924.

BEIRA, an ancient principality and province of northern and central Portugal; bounded on the north by Entre Minho e Douro and by Traz os Montes, east by the Spanish provinces of Leon and Estremadura, south by Alentejo and Portuguese Estremadura, and west by the Atlantic ocean. Pop. (1920) 1,597,573; area 9,208sq.m. Beira is administratively divided into the districts of Aveiro, Coimbra, Vizeu, Guarda and Castello Branco, while it is popularly regarded as consisting of the three sections—Beira Alta or Upper Beira (Vizeu), north and west of the Serra da Estrella; Beira Baixa or Lower Beira (Guarda and Castello Branco), south and east of that range; and Beira Mar or Maritime Beira (Aveiro and Coimbra). The coast, about 72m. long, is uniformly flat, with long stretches of sandy pine forest, heath, or marsh land bordered by a wide and fertile plain. Its most conspicuous features are the lagoon of Aveiro (*q.v.*) and the bold headland of Cape Mondego. Except along the coast, the surface is for the most part mountainous, the highest point in the Serra da Estrella, which extends from north-east to south-west through the centre of the province, being 6,532ft. The northern and south-eastern frontiers are respectively marked by the two great rivers Douro and Tagus, which rise in Spain and flow to the Atlantic. The Agueda and Côa, tributaries of the Douro, drain the eastern plateaux of Beira; the Vouga rises in the Serra da Lapa, and forms the lagoon of Aveiro at its mouth; the Mondego springs from the Serra da Estrella, passes through Coimbra, and enters the sea at Figueira da Foz; and the Zezere, a tributary of the Tagus, rises north-north-east of Covilhã and flows south-west and south.

Beira has a warm and equable climate, except in the mountains, where the snowfall is often heavy. The soil, except in the valleys, is dry and rocky, and large stretches are covered with heath. The principal agricultural products are maize, wheat, garden vegetables and fruit. The olive is largely cultivated and the oil exported; good wine is also produced. In the flat country between Coimbra and Aveiro the marshy land is laid out in rice-fields or in pastures for cattle and horses. Sheep farming is important in the highlands of Upper Beira; while near Lamego swine furnish the well-known Lisbon hams. Iron, lead, copper, coal and marble are worked to a small extent, and millstones are quarried in some places. Lagoons along the coast yield salt.

BEIRA, a seaport of Portuguese East Africa, at the mouth of the Pungwe and Busi rivers, 19° 50' S., 34° 50' E., 528 m. N. of Lourenço Marques, in communication by railway with Cape Town (2037 m.) via Umtali, Salisbury (374 m.) and Buluwayo (675 m.). On Dec. 31, 1926, the population included 2,167 whites. Beira is the chief port for Rhodesia and Katanga, communication being made by the Beira and Mashonaland and Rhodesian Railway (212 m.) under concession from the Mozambique Company. In 1922 the completion of a railway to the Zambezi made Beira the port for Nyasaland. The port is being increasingly used for transshipment of cargo for the smaller coast ports. In addition to the very important transit trade to Rhodesia, Katanga and Nyasaland, Beira also handles an increasing volume of traffic for the Mozambique Company's territories (*see* article on PORTUGUESE EAST AFRICA), of which it is the capital.

The town is built on a tongue of sand extending into the river, and is comparatively healthy. The average annual rainfall is 37 in., and the average annual temperature 75.58°. It is increasingly popular as a holiday resort for Rhodesians. The town is connected with the port by light railway lines. There are good golf links

just outside the town. There is a lighthouse at the river mouth, with a 16 m. radius, and the channel leading to the port is well buoyed and lighted. Vessels drawing 28 ft. of water can enter the port at high tide. There is good anchorage (the bottom is of soft mud, but safe in fine weather) in 5 fathoms (18–27 ft. at lowest tides), 135 yd. from the shore. The maximum depth in the harbour is 32 ft., minimum 12 ft. The depth at the customs wharf varies from 20 ft. to nil. On the bar, and in Rambler Channel, there is 12 ft. at lowest spring tides and 18 ft. at low tide (neap). The sea front is protected by a masonry wall. Ships are loaded and unloaded from anchorage by lighters towed by small steam-boats; and there is adequate wharf accommodation for large lighters. There are 10-ton cranes on the customs wharf, and 20-ton cranes on the railway wharf. It is possible to handle 450 tons daily per steamer. There is an excellent stone and cement passenger pier. Between the customs house and the railway terminus is the mouth of a small river, the Chiveve, crossed by a steel bridge, the centre span revolving and giving two passages each of 40 ft. The Chiveve embankment scheme reclaimed 80,000 square metres of land.

The Mozambique Company administers the Beira district under a charter granted in 1891 for a term of 50 years, renewable on its expiration in 1941. There is a considerable business community, largely British. Of the three banks, two are British. The town has a wireless station, and is in telegraphic communication with Salisbury in Mashonaland. Beira occupies the site of a forgotten Arab settlement. The present port owes its being to a clause in the Anglo-Portuguese agreement of 1891 providing for the construction of a railway between Rhodesia and the navigable waters of the Pungwe. (The Pungwe is navigable for small steamers for 40 m., and the Busi for 25 m. Both rivers are subject to serious floods which cause damage to the railway lines to Rhodesia and Nyasaland.) The railway at first began at Fontesvilla, about 50 m. by river above Beira, but was subsequently brought down to that port. The completion in 1902 of the line connecting Salisbury with Cape Town adversely affected the port, the long railway route from the Cape being increasingly employed by travellers to and from Mashonaland. Moreover, the high freights on goods by the Beira route enabled Port Elizabeth to compete successfully for Rhodesian trade. In Oct. 1905 a considerable reduction was made in railway rates and in port dues and customs, with the object of re-attracting to the port the transit trade of the interior; and in 1907 a branch of the Rhodesian customs was opened in the town, following the precedent of Lourenço Marques. These steps were successful. The principal exports are maize, rubber, cotton, sugar, ground-nuts and oil-seeds, beeswax, chromite (from Rhodesia), and gold (from Manica). The imports are chiefly rice (from India), cotton goods for local use, and food stuffs, machinery, hardware and manufactured goods for Rhodesia. Direct steamship communication with Europe is maintained by British, Portuguese and German ships, the former constituting by far the greater part of the tonnage using the port.

Shipping returns for the last two years are.—

	1926	1927
Ships entered	527	594
Passengers disembarked	7,881	7,348
Cargo unloaded	192,325 tons	208,865 tons
Ships left	509	595
Passengers embarked	4,804	4,910
Cargo loaded	275,931 tons	383,736 tons

See PORTUGUESE EAST AFRICA; also the reports issued yearly by the British Foreign Office on the trade of Beira.

BEIRUT, the chief seaport of Syria and the most beautiful, is situated on a triangular promontory roughly 6m. by 5m., backed by the Lebanon range. The bay thus formed to the north is known as St. George's bay for it was here, according to legend, that he slew the dragon. Pop. 95,000; 37,500 Mohammedans, 35,000 Christians, mostly Maronites.

History.—Beirut appears first in history in a list of Thotmes III. (early 15th century B.C.). In the epoch of the Amarna letters (1400 B.C.) its ruler was Ammunira, who contributed to the correspondence and was apparently a loyal vassal of the Pharaohs.

At any rate, the pro-Egyptian Rib-Addu of Byblos, a notable figure in the despatches, repaired to Beirut when forced to vacate Byblos. Beirut is mentioned, but no more, in the satiric Papyrus Anastasi I. of the time of Ramses II. (early 13th century B.C.). No mention is made apparently of Beirut in the Old Testament. The context does not admit of its identification either with Berothai (2 Sam viii 8) or with Berothah (Ezek. xlvii. 16). According to Strabo (xvi. 735) Beirut was taken and destroyed by Tryphon in his struggle with Demetrius II (Antiochus VII.) for the Seleucid throne (140 B.C.). Marcus Agrippa, a lieutenant of Augustus, captured the city in 15 B.C. and made it a military colony with the title *Colonia Julia Augusta Felix Berytus* (*Corp. Inscr. Lat.* iii. 161, etc.), with the added privilege of the *jus Italicum*. Herod the Great showed it favour by erecting many fine buildings and in Beirut was held the dramatic assembly before which Herod in person arraigned his two sons, Alexander and Aristobulus, and secured a majority sentence of death (Josephus, *Antiq.* xvi. 11.2). Agrippa I. (A.D. 37-44) and his son Agrippa II added to its attractions a theatre and an amphitheatre. It was here Titus celebrated the fall of Jerusalem and his father's birthday with gladiatorial contests. In Roman times the city of Beirut was famous as a home of learning. It was sought by many desirous of Greek learning, amongst them Appian the martyr. Its school of Roman law was recognized as one of the official law schools of the empire, until a disastrous earthquake (551) compelled its removal to Sidon. Gregory Thaumaturgus (A.D. 185-254), the wonder-working pupil of Origen, was a student here, and two of the professors of the law school, Anatolius and Dorotheus, drew up at Justinian's behest the third part of Justinian law, known as the Second Code (529-531). After the earthquakes Beirut was never restored to its former splendour and in A.D. 600 the great public buildings lay strewn where they had fallen. In 635 it passed under the blighting influence of the Arab occupation of Syria. The period of Frank domination was one of great military activity. The crusaders in their first progress along the coast from Antioch to Jerusalem (1099) passed within hail of the walls, but made no effort to attack. Baldwin I. captured the city in 1110 and in 1151 it was pillaged by the Egyptian fleet. From 1177 until its capture by Saladin (1187) it was the scene of incessant fighting. Saladin dismantled its defences (1190), dreading its reoccupation by the Franks. John of Beirut (d. 1236) restored castle and ramparts and the new defences in size and magnificence excelled any that had been before. Frederick II, having quarrelled with John, took the city by a night surprise, but the castle resisted till the siege was raised by the arrival of help from Cyprus (1232). The surrender of the city to the Mohammedans in 1291 marked the end of the kingdom of Jerusalem. Thereafter it was dominated in turn by Mameluke sultans of Egypt, Druse emirs of the Lebanon, and the Turks (from 1517). The most famous of the Druse emirs was Fakhr-ed-Din (1584-1635) who made himself independent of the Turks, chose Beirut as his residence, fortified it, and by an alliance with Venice did much to foster and develop its trade. The Turks forced their way into the city in 1763 and in 1789 the city was finally freed from Druse interference. Ahmad el-Jezzar of Acre (1775-1804) re-established the defences, built a new castle on the site of the old and completed the circle of the walls, but his building was not substantial. Beirut was occupied by the forces of Mohammed Ali of Egypt in 1830-31. He made the city his quarantine station for the Syrian coast and all ships were obliged to come to its port to the benefit of its trade. In 1840 the Egyptians were dislodged—Beirut in the process being bombarded by the allied fleets (Britain, Austria, Turkey)—and the city restored to Turkish possession. During the massacres in the Lebanons (1860) large numbers of Christian refugees took shelter in Beirut and settled there. In the course of the war between Turkey and Italy a Turkish gunboat was sunk in the harbour by the Italian fleet (1912). On Oct. 8, 1918, Indian troops (7th Meerut Division) of the Egyptian Expeditionary Force entered Beirut, but France, whose war vessels had arrived in the harbour shortly before, installed a military governor.

Antiquities.—The buildings shattered by the earthquakes of the 6th century were never apparently rebuilt. Fakhr-ed-Din is

said to have used a large number of columns to block the harbour and Mahmud Bey, governor in 1839-40, built a breakwater entirely of columns, only to have it swept away by a violent storm the following year. In 1852 Robinson speaks of the city wall (Jezzar's) then almost entire, columns of a temple, an aqueduct leading under the city, ancient walls and foundations on the rocks on the seashore where was a small harbour. The great aqueduct, probably of the period of Herod the Great, which led water from the Lebanon to the city across the plain on an immense wall, was still fairly complete about 1840. Later it became a quarry for building stones. Recently French savants have decided to proceed with investigations and excavations on promising sites in the city. At the corner of the streets Allenby and Weygand there have been discovered two bases for statues with Latin inscriptions commemorating a certain Santius Proculus who held important military and civil posts under the Romans in first century A.D.

Modern.—Under French mandatory control Beirut, possessing itself municipal autonomy, is also the capital of the autonomous State of Great Lebanon (Grand Liban), and the residence of the French high commissioner for Syria. It is the see for archbishops or bishops of several communions, and a famous centre of learning. Higher education is provided by the American and Jesuit colleges and the list of Christian mission schools and seminaries, both Protestant and Catholic, is long and imposing. The city has been equipped with a good water supply (1875) and gas installation (1888), now amalgamated (1925) with the Electric Tramway Company to provide an electric supply. Beirut has some fine squares but the bazaars are poor. Some of the meaner parts were demolished by Jenial Pasha in 1916 to widen the main streets. Beirut is connected by rail with Damascus (1895) and with Aleppo via Rayak (1907). Railways coastwise to Tripoli (there is a steam tramway as far as Ma'amaltein) and Acre are contemplated. A harbour was constructed in 1889, but only vessels of light draught can range alongside the quays and most of the unloading is by lighters. Port charges are heavy. During 1924 there entered the port 656 steamers, total tonnage 1,357,930 and 2,174 sailing vessels, total tonnage 42,524.

Beirut has long been famous for its export trade. As early as the first century A.D. its sweet wine, linen and silk stuffs penetrated to all parts of the known world. Under Turkish rule Beirut was a distributing centre for a large block of territory stretching from Hama to Jaffa and extending to Damascus and the Hauran. The erection of a frontier between Syria and Palestine has tended to restrict its sphere of economic influence in spite of the relief afforded by the customs agreement between Syria and Palestine in 1921. Yet trade has continued to make steady recovery since 1918. Comparisons of annual values of trade expressed in francs are apt to be misleading because Syrian currency is now based on French and has fluctuated correspondingly in value. The chief imports through Beirut in 1925 were building materials (cement, wood, iron) cotton manufactures, flour, rice, motor spirit, salt; and the chief exports, fruits and seeds, native foodstuffs, hides, manufactured goods, textiles, metal work, woodwork, cocoons, wool, live animals. An international exhibition was held at Beirut in 1921. Twice weekly a fleet of motor cars carrying passengers and mails leaves Beirut for Baghdad via Damascus (inaugurated 1923). The time occupied is about two days.

BEISA (*Oryx beisa*), an Abyssinian antelope. See ORYX; ANTELOPE.

BEISAN, a town situated on a low tableland where the vale of Esdraelon stoops down to the Jordan valley; pop. 15,000, almost entirely Muslim (Hebrew Beth-She'an [Shān], "house of Tranquillity"; in classical times bore the name of Scythopolis and on coins Nys[s]a). The area of the ancient town enclosed within walls was extensive and at some time was subdivided into walled quarters. The modern town occupies the southern quarter only. A mound, mainly artificial, rising 250 ft. above the bed of the river Jalud and now known as Tell Husn formed the acropolis of the

early city. Under British mandate (1922) Beisan is in the Nazareth area of the northern district of Palestine.

History.—Thutmose III. crushed a confederacy of tribes in the plain of Esdraelon in 1479 B.C. and the name of Beth-shan appears in a list of his conquests. From the time of Seti I. (1314 B.C.) to that of Ramses III. (1198) Egypt controlled its destinies. Reference, too, is made to the city in the Papyrus Anastasi of the period of Ramses II. It sustained a Canaanite enclave in Israelite territory long after the occupation (Judg. i. 27, Josh. xvii., 11), and it was possibly not till the time of David (c. 1,000 B.C.) that this stronghold fell into the hands of the Israelites. After the battle of Gilboa (c. 1020 B.C.) the bodies of Saul and his sons were exhibited on its walls (I. Sam. xxxi., 12). Sheshonk of Egypt returned to plunder it in 926 B.C. and from then till the last quarter of the 7th century it was in the hands of Assyria. The name Scythopolis suggests that the Scythian invasion (626 B.C.) in its ebb had left here a settlement, although other derivations have been suggested. From 301–198 B.C. Beisan was tributary to the Ptolemies, thereafter coming under Seleucid rule as a result of the conquests of Antiochus III. It fell into the hands of John Hyrcanus (107 B.C.). Pompey dispossessed the Jews in 65 B.C. and Scythopolis became eventually autonomous and the chief city of Decapolis. Greatly extended at this time it was equipped with temples, theatre, hippodrome, aqueducts, colonnaded streets, etc., and surpassed Jerusalem in population and commerce. The seat of a bishop it became also a centre of monasticism in the 4th century. When the Muslims overran Syria (A.D. 636) one of the decisive battles of the campaign was fought in its neighbourhood. The crusaders found in it a city far advanced in decay. They made no effort to re-fortify it, and it was taken at the second attempt by Saladin, who consigned it to the flames (1187). With the rest of the land it came under the power of the Ottoman Turks (A.D. 1517). Beisan was occupied by the 4th Cavalry Division of the Egyptian Expeditionary Force on Sept. 20, 1918, with little resistance offered.

Excavations.—In the year 1921 the University Museum of Philadelphia began excavations on an extensive scale on the Tell, and have obtained results of great interest and value. The initial cutting to test stratifications showed that the levels descended beyond the 16th century B.C. without reaching virgin soil. Eight levels have been distinguished ranging from the 19th century A.D. back to the 16th century B.C. and beyond. Two churches and four brick temples have been discovered. Two of the latter are referred to in the Old Testament, viz., the House of Ashtaroth (I. Sam. xxxi., 10) and the Temple of Dagon (I. Chron. x., 10). Both were in use until at least 1000 B.C. Amongst the discoveries are stelae of Seti I. and Ramses II. (the stele of Ramses contains a reference to the town of Ramses in Egypt) (Ex. i, 11), a magnificent Hittite battle-axe, Syro-Hittite cylinder seals, the model of a throne of Minoan type, pots of gold and silver ingots and jewellery, and a wide variety of cult objects. The cemeteries to the north of the mound have also been investigated and have yielded a number of large anthropoid sarcophagi of the 12th century B.C. and also the sarcophagus of Antiochus, cousin of Herod the Great. From tombs of the Hellenistic, Roman and Byzantine periods have come alabaster, glass, pottery and bronze objects in astonishing wealth and variety. A find of special interest has been a cubical pottery die marked like our modern dice with points from one to six.

See G. A. Smith, *Historical Geography of the Holy Land* (1897, etc.); G. J. H. Oviden, "Notes on Excavations at Beisan," *Palestine Exploration Fund Quarterly Stat.*, 147 sqq., 1923; A. Rowe, "The New Discoveries at Beth-Shan," *Palestine Exploration Fund Quarterly Stat.* 67 sqq., 1927.

BEIT, ALFRED (1853–1906), British South African financier, was the son of a well-to-do merchant of Hamburg, Germany, and in 1875 was sent out to Kimberley, South Africa. In conjunction with Mr. (afterwards Sir) Julius Wernher (b. 1850) he rapidly acquired a leading position on the diamond fields, and became closely allied with the ideals of Cecil Rhodes (q.v.). In 1889 Rhodes and Beit effected the amalgamation of various interests in the De Beers Consolidated Mines, Limited. By his exceptional gifts Beit amassed enormous wealth, and he utilized it lavishly in pursuit of Rhodes's South African policy. He was

one of the original directors of the British South Africa company, and was included with Rhodes in the censure passed by the House of Commons Commission of Inquiry on the Jameson Raid (1896). He was one of Rhodes's trustees. He endowed the professorship of colonial history at Oxford (1905), gave £100,000 to establish a university in his native city of Hamburg and £200,000 for a university in Johannesburg. He died, unmarried, on July 16, 1906.

BEITH, town and parish, Ayrshire, Scotland, 18½m. S.W. of Glasgow, by the L.M.S. railway. Pop. of parish (1921), 6,342. The town stands high, overlooking Kilbirnie loch, but in a district disfigured by manufacturing and mining industries. Coal, iron and limestone are worked and there are manufactures of linen thread, netting and furniture, leather works and silk printing works. The ruins of a castle of the Montgomeries are at Giffen, near Beith.

BEJA. The truly Hamitic, i.e., Beja, area of the Anglo-Egyptian Sudan extends from the Red Sea to the Nile, and from the Egyptian boundary in the north to the neighbourhood of the junction of the Atbara with the Nile. South of this there are no easily defined natural boundaries, but the tribes do not come west of the Atbara in any strength, so that roughly speaking this river may be considered their western limit until it reaches the Abyssinian boundary between 15° and 14° N. The tribes inhabiting this area may be divided into three great groups. From north to south these are:—

(1) The Bisharin, extending for some 80m. south of the Egyptian boundary, and occupying a strip of territory stretching along the right bank of the Atbara.

(2) The Hadendoa, with a number of closely allied tribes of which the Hadendoa is the strongest and best known. Including the Amarar, the Nurab, the Ashraf and the Artega, the country of the Hadendoa extends south and east of the Bisharin territory as far as Tokar and the Khor Baraka, and thence southwards to the neighbourhood of Kassala. West of the Khor Baraka and its main tributary, the Khor Langeb, the country belongs to the Beni Amer. The Halenga near Kassala, who have adopted many Abyssinian ideas and habits, should probably be included in the Hadendoa group; they are certainly Beja, as are the so-called Hamran Arabs.

(3) The Beni Amer, extending into Eritrea, where they form one of the most important elements in the population.

Language.—The Bisharin and Hadendoa (and allied tribes) speak a Hamitic language called To Bedawi; the Beni Amer speak a Semitic language known as Tigre. But in spite of the difference in language the habits of the Beni Amer and Hadendoa are largely identical, although the latter are fiercer and wilder. During the Mahdia, the Beni Amer took practically no part in the fighting which was so courageously sustained by the Hadendoa, the "Fuzzy-Wuzzy" of the British soldier.

Physical Characteristics.—As Seligman has pointed out ("Some Aspects of the Hamitic Problem in the Anglo-Egyptian Sudan," *Journ. Roy. Anthropol. Inst.*, vol. xliii., 1913) the Beni Amer, their purest representatives, reproduce with astounding fidelity the physical characteristics of those early Hamites the predynastic Egyptians, the earliest known inhabitants of the Nile Valley. In stature (about 64in.) the two people are identical, as are the measurements and character of their skulls. Northwards the skull becomes progressively broader, its length remaining approximately unaltered, so that the Hadendoa skull is rounder than that of the Beni Amer and the Bisharin skull is almost brachycephalic. This applies to the riverain Bisharin. Recently G. W. Murray ("The Northern Beja," *Journ. Roy. Anthropol. Inst.*, vol. lvii. 1927) has shown that the Bisharin of the Red Sea coast are dolichocephalic, with a cephalic index of 74.73. There is little difference in height between Beni Amer and Bisharin, but the Hadendoa are distinctly taller and often darker. The fact that the Hadendoa unlike the Beni Amer often have typically Armenoid (so-called "Jewish") noses is no doubt to be explained by an infusion of foreign blood from beyond the Red Sea. Apart from minor differences, the Beja are moderately short, slightly built men, with reddish-brown or brown skins. The face is usually

long and oval, or approaching the oval in shape, the jaw is often lightly built, which, with the presence of a rather pointed chin, may tend to make the upper part of the face appear broader than it really is. The nose is well shaped and thoroughly Caucasian in type and form, except where Negro blood may be suspected. The hair is usually curly, in some cases it might be described as wavy, but the method of hair dressing adopted tends to make difficult an exact description of its condition. The hair on the face is sparse; slight side-whiskers, moustache and chin-tuft beard are the rule, leaving the area between the lower lip and the chin bare, while there is also some considerable space between the whiskers and the moustache. Not uncommonly, especially in the younger men, the whole face is shaved.

Mode of Life.—Essentially nomad pastoralists, the relative accessibility of water in the Beja country, at any rate in the south (as compared with that of the nomad Arabs of Kordofan), permits the free wanderings of units as small as the family group even in the dry season. The Mohammedanism of the Beja, though fervid in some tribes such as the Hadendoa, is relatively recent, for Makrizi (1346–1442) wrote of them as for the most part heathen, and even the little that is known of them at the present day indicates the persistence of a great number of non-Islamic beliefs. (C. G. S.)

See references in text and H. A. Mac Michael, *Tribes of Northern and Central Kordofan* (1912) and *History of the Arabs in the Sudan* (1922).

BEJA, town in Portugal, 95m S S E. of Lisbon by railway; it is probably the ancient *Pax Julia*. Pop. (1911) 10,113. Beja is an episcopal city on an isolated hill, and partly enclosed by walls of Roman origin with fine Roman south gateway. The citadel, with its beautiful Gothic tower of white marble, was founded by King Dinis (1279–1325). Grain and fruit are grown and cattle and pigs are bred on the Campo de Beja, plains around the city; copper, iron and manganese are mined to a small extent, and Beja is the central market for all these products. Cloth, pottery and olive oil are manufactured in the city.

The administrative district of Beja coincides with the southern part of Alentejo (q.v.); pop. (1900) 163,612; area, 3,958 square miles.

BEJAN, a term for freshmen, or undergraduates of the first year, in the Scottish universities (Fr. *béjaune*, from *bec jaune*, "yellow beak," in allusion to unfledged birds). The phrase was introduced from the French universities, where the levying of *bejaunium*, "footing-money," had been prohibited by the statutes of the University of Orleans in 1365 and by those of Toulouse in 1401.

BÉJART, the name of several French actors, children of Marie Hervé and Joseph Béjart (d. 1643), the holder of a small government post. One of the sons, JOSEPH BÉJART (c. 1617–59), was a strolling player and later a member of Molière's first company (l'illustre Théâtre), accompanied him in his theatrical wanderings, and was with him when he returned permanently to Paris, dying soon after. He created the parts of Lélie in *L'Étourdie*, and Eraste in *Le Dépit amoureux*. His brother LOUIS BÉJART (c. 1630–78) was also in Molière's company during the last years of its travels. He created many parts in his brother-in-law's plays—Valère in *Le Dépit amoureux*, Dubois in *Le Misanthrope*, Alcantor in *Le Mariage forcé*, and Don Luis in *Le Festin de Pierre*. He was lamed in a brawl, and retired with a pension—the first ever granted by the company to a comedian—in 1670.

The more famous members of the family were two sisters,

MADELEINE BÉJART (1618–72) was at the head of the travelling company to which her sister Geneviève (1631–75)—who played as Mlle Hervé—and her brothers belonged, before they joined Molière in forming l'illustre Théâtre (1643). With Molière she remained until her death on Feb. 17 1672. She was an excellent actress, particularly in soubrette parts, a number of which Molière wrote for her. Among her creations were Marotte in *Les Précieuses ridicules*, Lisette in *L'École des maris*, Dorine in *Tartuffe*.

Her sister, ARMANDE GRÉSINDE CLAIRE ELIZABETH BÉJART (1645–1700), seems first to have joined the company at Lyons

in 1653. In 1662 Molière married her, he being then 40 and she 17. Neither was happy; the wife was a flirt, the husband jealous. They separated after the birth of a daughter in 1665 and met only at the theatre until 1671. But Molière could not resist her charm and they were reconciled. Her portrait is given in Act. iii., sc. 9 of *Le Bourgeois gentilhomme*. Mme Molière's first appearance on the stage was in 1663, as Elise in the *Critique de l'école des femmes*. She was out of the cast for a short time in 1664, when she bore Molière a son—Louis XIV and Henrietta of England standing sponsors. But in the spring, beginning with the fêtes given at Versailles by the king to Anne of Austria and Maria Theresa, she started her long list of important rôles. She was at her best as Celimène—really her own highly finished portrait—in *Le Misanthrope* and hardly less admirable as Angélique in *Le Malade imaginaire*. She was the Elmire at the first performance of *Tartuffe*, and the Lucile of *Le Bourgeois gentilhomme*. After Molière's death Armande leased the Théâtre Guénégaud, and by royal ordinance the residue of her company were combined with the players from the Théâtre du Marais, the fortunes of which were at low ebb. The combination, known as the *troupe du roi*, at first was unfortunate, but in 1679 they secured Mlle du Champmeslé and absorbed the company of the Hôtel de Bourgogne. Mme Molière in 1677 had married Eustache François Guérin (1636–1728), an actor, and by him she had one son (1678–1708). She retired in 1694, and died on Nov. 30, 1700.

BEK, ANTONY, bishop of Durham from 1283 to 1311. Edward I. employed him on diplomatic errands to Scotland in 1285, and to the German king in 1294. He took part in Edward's campaigns in Scotland, received the surrender of John de Baliol at Brechin in 1296, and led one division of the English army at the battle of Falkirk in 1298. He became involved in a quarrel with Richard de Hoton, prior of Durham, whom he excommunicated. In 1302 he visited Rome on this matter, and during his absence the king seized and administered his lands, which, however, he recovered when he submitted to Edward. He died at Eltham on March 3 1311. A man of great courage and energy, chaste and generous, Bek was remarkable for his haughtiness and ostentation. He was a soldier and a hunter rather than a bishop, and built castles at Eltham and elsewhere.

Bek's elder brother, THOMAS BEK (d. 1293), was treasurer of England in 1279, and became bishop of St. David's in 1280. Another THOMAS BEK (1282–1347) was bishop of Lincoln from 1341 until 1347.

Antony Bek must not be confused with his kinsman and namesake, ANTONY BEK (1279–1343), who was chancellor and dean of Lincoln cathedral, and became bishop of Norwich after a disputed election in 1337. He was a quarrelsome man and had a turbulent episcopate.

BIBLIOGRAPHY.—See W. Hutchinson, *History of Durham* (Newcastle, 1785–94); Robert of Graystanes, *Historia de statu ecclesiae Dunelmensis*, edited by J. Raine in his *Historiae Dunelmensis scriptores* (1830); J. L. Low, *Diocesan History of Durham* (1881); and M. Creighton in the *Dictionary of National Biography*.

BEK-BUDI KENIMEKH (formerly Karshi), a town in the Uzbek S.S.R., at the junction of the two main tributaries of the Kashka-Darya. Lat. 38° 52' N., long. 65° 56' E. Pop. (1926) 14,150. It is the centre of a fertile oasis growing grain, poppies, tobacco and fruit: mulberry, poplar and apricot trees are features of its gardens. It was the favourite residence of Timur and its fine Biki mosque, inlaid with blue and white tiles, is famous. A branch railway links it to Shehri-Sebz (the Green City), the birthplace of Timur (Tamerlane). Roads from Samarkand, Bukhara, Hissar, Balkh and Maimana meet here, and there are railway lines to Bukhara and Termez. The city is an exchange mart for carpets, knives, firearms and the noted work of its coppersmiths; it is also an educational centre with three colleges. Its water supply is stagnant and water-borne diseases are prevalent.

BEKE, CHARLES TILSTONE (1800–1874), English geographer and Biblical critic. From 1838 till his death he was principally engaged on geographical studies of the Nile valley. He visited Abyssinia in connection with the mission to Shoa, and was the first scientifically to determine the course of the Blue Nile (see *Journal of the Royal Geographical Society*). In 1848

he planned an expedition to discover the sources of the Nile, but nothing of importance was accomplished. In 1861–62 he travelled in Syria and Palestine, then going to Egypt in an attempt to promote trade with Central Africa, and to urge the growing of cotton in the Sudan. In 1865 he went again to Abyssinia to obtain from King Theodore the release of the British captives. In the year of his death he made a journey to Egypt to determine the real position of Mount Sinai. He wrote *An Essay on the Nile and its Tributaries* (1847), *The Sources of the Nile* (1860), and *The British Captives in Abyssinia* (1865).

See *Summary of the late Dr. Beke's published works and . . . public services*, by his widow (Tunbridge Wells, 1876).

BÉKÉSCSABA, a busy regional market town in Hungary, 123m. south-east of Budapest. Situated near the White Körös, with which it is connected by canal, it is an important railway junction with an active trade in the characteristic products of the Hungarian plain, viz., cereals and cattle. There are milling and hemp industries. The population (42,599) is largely Slovak and the town contains the largest Lutheran community in Hungary.

BEKHTEREV, VLADIMIR MIKHAILOVICH (1857–1927), Russian neuropathologist, was born in the province of Viatka. He studied medicine in the medico-surgical academy at St. Petersburg (now Leningrad). In 1884 he went abroad to do research work under Du Bois-Reymond, Wundt and Charcot, and was appointed professor at the University of Kazan, where he started clinical research of mental diseases and promoted the first psycho-physiological laboratory. In 1893 he became professor of the Military Medical Academy in St. Petersburg and was elected director in 1905–6. To foster psycho-physiological research, he founded in 1907 in St. Petersburg a psycho-neurological institute, which existed on private donations up to 1917, when an additional brain institute was formed and both were taken over by the government. He published more than 500 scientific papers on pathology and anatomy of the nervous system and founded a society of neuropathologists and the periodical *Neurologicheski Vestnik*. Bekhterev died on Dec. 24, 1927, at Moscow. On the celebration of his 70th birthday he received the title of "Scientist Emeritus." His work on *The Nerve Currents in Brain and Spinal Cord* appeared first in Russia in 1882; the second edition in 1896 has been translated into French and German (1894). *The Functions of the Nervous Centres* appeared in Russia in 1909; his *Psychology Objectively Demonstrated* was published in 1910 (Fr. trans. by N. Kotyleff, 1913); and his *General Diagnosis of the Nervous System Diseases* in 1911; *General Basis of the Reflex Action of Man; a Treatise of Objective Biological Study of Personality* (3rd ed. 1926).

BEKKER, AUGUST IMMANUEL (1785–1871), German philologist and critic. He studied classics at Halle under F. A. Wolf. In 1810 he was appointed professor of philosophy at Berlin. For several years, between 1810 and 1821, he travelled in France, Italy, England and parts of Germany, examining classical manuscripts and gathering materials for his editorial labours. He died at Berlin on June 7, 1871. Some detached fruits of his researches were given in the *Anecdota Graeca*, 1814–21; but the full result is to be found in the enormous array of classical authors edited by him. His industry extended to nearly the whole of Greek literature, except tragedy and lyric. His best-known editions are: *Plato* (1816–23), *Oratores Attici* (1823–24), *Aristotle* (1831–36), *Aristophanes* (1829), and 25 volumes of the *Corpus Scriptorum Historiae Byzantinae*. The only Latin authors edited by him were Livy (1820–30) and Tacitus (1831). Bekker confined himself to textual recension and criticism, in which he relied solely upon the mss., and contributed little to the extension of general scholarship.

See Sauppe, *Zur Erinnerung an Meineke und Bekker* (1872): Haupt, "Gedächtnisrede auf Meineke und Bekker," in his *Opuscula*, iii.; E. I. Bekker, "Zur Erinnerung an meinen Vater," in the *Preussisches Jahrbuch*, xxix; Sandys, *Hist. of Classical Scholarship*, iii. p. 85 ff. (1908).

BEKKER, BALTHASAR (1634–1698), Dutch divine, was born at Metslauier, in Friesland, March 30, 1634. He was pastor at Franeker, and from 1679 at Amsterdam. His best known work was *Die Betwoorde Wereld* (1691), or *The World Bewitched* (1695) (one vol. of an English trans. from a French

copy); in which he attacked the belief in sorcery and "possession" by the devil. The book led to Bekker's deposition from the ministry. He died at Amsterdam on July 11, 1698.

BEKKER (or **WOLFF**), **ELIZABETH** (1738–1804), Dutch novelist, was married to Adrian Wolff, a Reformed clergyman. After the death of her husband in 1777, she resided for some time in France with her close friend, Agatha Deken. In 1795 she returned to Holland, and resided at The Hague till her death. Her novels were written in conjunction with Agatha Deken, and it is somewhat difficult to determine the exact qualities contributed by each. The *Historie van William Levend* (1785), *Historie van Sara Burgerhart* (1790), *Abraham Blankaart* (1787), *Cornelie Wildschut* (1793–96), were extremely popular.

BÊL, the Accadian word for "lord," the counterpart of the Phoenician Baal (*q.v.*), Sumerian *en*. It is, therefore, a title given to a deity at the head of a pantheon. It may have been first applied as a *divine name* to En-lil, of which the first element again has the force of "lord" and the second "wind." En-lil is associated with the ancient city of Nippur. The designation of En-lil as "Bêl" or the "lord" reverts to a very early period—prior to 3000 B.C. when Nippur had become the centre of a political district of considerable extent. Inscriptions found at Nippur, during 1888–1900 show that En-lil of Nippur was in fact regarded as the head of an extensive pantheon. Among the titles accorded to him are "king of lands," "king of heaven and earth" and "father of the gods." His chief temple at Nippur was known as E-Kur, signifying "mountain house," and such was the sanctity acquired by this edifice that Babylonian and Assyrian rulers, to the latest days, embellished and restored Bêl's seat of worship, and the name itself became the designation of a temple in general. Grouped around the main sanctuary there arose temples and chapels to the gods and goddesses who formed his court, so that E-Kur became the name for an entire sacred precinct in the city of Nippur. The tower, however, also had its special designation of "E-Im-Khur-sag," meaning "House of the wind of the mountain," i.e., wind of the earth mountain, the Sumerians believing that the winds emerge from caverns of the lower world, hence the titles of the earth god En-lil, Imkhursag.

With the rise of Babylon as the centre of a great empire, Nippur yielded its prerogatives to the city over which Marduk presided; the attributes and the titles of En-lil were transferred to Marduk, who becomes the "lord" or Bêl of later days. The older Bêl did not, however, entirely lose his standing. Nippur continued to be a sacred city after it ceased to have any considerable political importance. When the Greek writers refer to the Babylonian deity Bêlos, they invariably mean Marduk of Babylon, especially in his rôle as Tammuz the dying god. It is most uncertain that the Babylonians ever referred to En-lil and Nin-lil of Nippur as the deities Bêl and Bêlit.

See also BÊLIT and BAAL. For the apocryphal book of the Bible, *Bêl and the Dragon*, see DANIEL: *Additions to Daniel*.

BELA III. (d. 1196), king of Hungary, was the second son of King Geza II. Educated at the Byzantine court, he married Agnes of Châtillon, duchess of Antioch, and in 1173 was placed by the emperor Manuel by force of arms on the Hungarian throne. Bela began by adopting Catholicism and seeking the assistance of Rome. He then made what had hitherto been an elective a hereditary throne by crowning his infant son Emerich his successor. The attempt to recover Dalmatia, which involved Bela in two bloody wars with Venice (1181–88 and 1190–91), was only partially successful. But he assisted the Rascians or Serbs (see HUNGARY: *History*) to throw off the Greek yoke and establish a native dynasty, and attempted to make Galicia an appanage of his younger son Andrew. It was in Bela's reign that the emperor Frederick I, in the spring of 1189, traversed Hungary with 100,000 crusaders. In his last years Bela assisted the Greek emperor Isaac II. Angelus against the Bulgarians. His first wife bore Bela two sons, Emerich and Andrew. On her death he married Margaret of France, sister of King Philip Augustus. Bela was in every sense of the word a great statesman, and his court was accounted one of the most brilliant in Europe. The Hungarian dramatist, Ede Szigliger (*q.v.*), immortalized his memory in a play.

BELA IV. (1206–1270), king of Hungary, was the son of Andrew II, whom he succeeded in 1235. During his father's lifetime he colonized and christianized Transylvania. The salient event of Bela's reign was the terrible Tatar invasion which reduced three-quarters of Hungary to ashes. The terror of their name had long preceded them, and Bela, in 1235 or 1236, sent the Dominican monk Julian, by way of Constantinople, to Russia, to collect information about them from the "ancient Magyars" settled in the country east of the Volga. He returned to Hungary with the tidings that the Tatars contemplated the immediate conquest of Europe. Bela appealed to the pope, the duke of Austria and the emperor for assistance; but in February and March 1241 the Tatars burst through the Carpathian passes; in April Bela himself, after a gallant stand, was routed on the banks of the Sajó and fled to the islands of Dalmatia; and for the next twelve months the kingdom of Hungary was merely a geographical expression. The last 28 years of Bela's reign were mainly devoted to the reconstruction of his realm, which he accomplished with a single-minded thoroughness which has covered his name with glory. (*See HUNGARY: History.*)

Perhaps the most difficult part of his task was the recovery of the western portions of the kingdom (which had suffered least) from the hands of Frederick of Austria, who had seized them as the price of assistance which had been promised but never given. Bela crossed the Leitha on June 15, 1246, and routed Frederick, who was killed in the battle. With him was extinguished the male line of the house of Babenberg. In the south Bela was obliged, in 1243, to cede to Venice, Zara, a perpetual apple of discord between the two states; but he kept his hold upon Spalato and his other Dalmatian possessions, and his wise policy of religious tolerance in Bosnia enabled Hungary to rule that province peaceably for many years. The new Serb kingdom of the Nemanides, on the other hand, gave him much trouble and was the occasion of many bloody wars. In 1261 the Tatars under Nogai Khan invaded Hungary for the second time, but were defeated by Bela. For a time Bela was equally fortunate in the north-west, where the ambitious and enterprising Přemyslidae had erected a new Bohemian empire which absorbed the territories of the old Babenbergers and was very menacing to Hungary. With Ottakar II. in particular, Bela was almost constantly at war for the possession of Styria, which ultimately fell to the Bohemians. In his later years his son Stephen compelled him to divide the kingdom with him, the younger prince setting up a capital of his own at Sárospatak. Bela died on May 3, 1270, in his sixty-fourth year. He married, while still crown prince, Maria, daughter of the Nicaean emperor, Theodore Lascaris. She bore him, besides his two sons Stephen and Bela, seven daughters, of whom St. Margaret was the most famous.

No special monograph for the whole reign exists. For the Tatar invasion see the contemporary Rogerius, *Epistolae super destructione Regni Hungariae per Tartaros facta* (1885). A vivid but somewhat chauvinistic history of Bela's reign will be found in Ácsády's *History of the Hungarian Realm* (Hung.), i. 2 (1903). (R. N. B.)

BELA, LAS BELA or LUS BEYLA, a town situated in 26° 27' 30" N. lat. and 60° 45' 0" E. long., 350 ft. above sea level, the capital of Las Bela, south of Kalat (Baluchistan), ruled by the Jam (or Cham), who occupies the position of a protected chief under the British Raj. From time immemorial the trade route between Sind and Persia has passed through Las Bela and Makrân. The area is 6,357 sq. m., and population (1901) 56,109, 54,040 being Muslim. Two rivers from the north, the Purâli and the Kud, unite to provide water to irrigate the fertile, alluvial, hot and malarial plains of Las Bela on the north-east corner of the Arabian Sea. The hill-ranges to the east, parting the plains from Sind (generally known locally as the Mor and the Kirthar), between which lies the long narrow line of the Hab valley, strike nearly north and south, diminishing in height as they approach the sea and allowing of a route skirting the coast between Karachi and Bela. To the west they are broken into an infinity of minor ridges massing themselves in parallel formation with a strike which curves from south to west till they form the coast barrier of Makrân. The Persian route from India, curving somewhat to the north, was important in the mediaeval days of Arab

ascendency in Sind, and it is to this route that Bela owes a place in history. Bela is itself rather prettily situated and about four miles to the south are the well-kept gardens which surround the tomb of Sir Robert Sandeman. The population of the town numbers about 5,000. The Jam's retinue consists of about 300 infantry, 50 cavalry and 4 guns. Liability to assist on active service is the only acknowledgment of the suzerainty which is paid by the Jam to the Khan of Kalat.

There are traces of ancient Arab (possibly Himyaritic) occupation to be found in certain stone ruins at Gondakeha on the Kud river, 10 m. to the north-west of Bela, whilst the Greek name "Arabis" for the Purâli is itself indicative of prehistoric connection with races of Asiatic Ethiopians referred to by Herodotus. On the coast, near the village of Sonmiani may be traced the indentation which once formed the bay of Morontobara, noted in the voyage of Nearchus; and it was on the borders of Makrân that the Turanian town of Rhambakia was situated, which was once the centre of the trade in "bdellium." In the 7th century A.D. Las Bela was governed by a Buddhist priest, at which time all the province of Gandava was Buddhist, and Sind was ruled by the Brahman, Chach. With the influx of Arabs into Makrân, Bela, under the name of Armel (or Armabel), rose to importance as a link in the great chain of trading towns between Persia and Sind; and then there existed in the delta important towns each with its citadel, its caravanserai and bazaar, which are not only recorded but actually mapped by one of the mediaeval Arab geographers, Ibn Haukal, and many old sites can be traced. The Lumris, or Lasis, who originate the name Las as a prefix to that of Bela, are the dominant tribe in the province. They are comparatively recent arrivals who displaced the earlier Tajik and Brahui occupants. It is probable that this influx of Rajput population was coincident with the displacement of the Arab dynasties in Sind by the Mohammedan Rajputs in the 11th century A.D. Some authorities connect the Lumris with the Sumras.

BELASCO, DAVID (1859–), American playwright and theatrical manager, was born at San Francisco (Cal.), on July 25, 1859, the son of adventurous Hebrew parents lured there by the gold rush. He spent part of his boyhood in Victoria, Texas, and gained much of his education in various schools and a monastery there. By heritage he was drawn to the stage and early played juvenile parts. When he was a mere child, too, he did his first dramatic writing. After a boyhood of varied experiences and hard work, he became a theatrical vagabond, serving as call-boy, actor, stage manager, adapter and writer of plays. When at 29 he definitely left San Francisco after having been established there for a number of years, he had acted more than 170 parts, had altered or written more than 100 plays and had been the responsible director in the production of more than three times that number. After similar work in the Madison Square theatre and with Daniel Frohman he became a successful independent dramatist and producer with *The Heart of Maryland* (1895). Among his later outstanding successes were the oriental romances *Madame Butterfly* (with J. L. Long, 1900) and *The Darling of the Gods* (with J. L. Long, 1902); *The Girl of the Golden West* (1905) and *The Rose of the Rancho* (with R. W. Tully, 1906), which reflected his western experience; and *The Return of Peter Grimm* (1911). In addition to his work as an extremely successful adapter and composer of plays, Belasco has been for many years one of the foremost American managers and producers. Under his direction have appeared such distinguished actors as Blanche Bates, Lenore Ulric and David Warfield. Belasco's productions are noted for the sumptuousness of their stage effects. Belasco wrote *The Theatre through the Stage Door* (ed. by L. V. Defoe, 1919).

See also Belasco's reminiscences, which appeared in *Hearst's Magazine* (1914–15) and the authoritative *Life of David Belasco* (1918) by William Winter.

BELAWAN (DELI), N. Sumatra, Dutch East Indies, on Pulau Belawan, an island of mud and mangroves, at the estuary of the Deli and Belawan rivers. It is the port for Medan, serves the rapidly-expanding trade of the east coast of Sumatra, and is the most important port in N. Sumatra. The hinterland grows tobacco

in Deli, Langkat, and Serdang, and Belawan is the port of shipment for the tobacco, and other produce, rubber, tea, palm-oil, and sisal fibre. When present improvements are completed, it will have about 6,000 ft. of wharfage space, with the necessary warehouse accommodation. The harbour is greatly handicapped by the bar of the deep Belawan river, and powerful dredgers are kept at work continually to keep open the deep channel, and make it deeper. At present there is a minimum depth of 25 ft. at low tide over a width of 60 metres in the channel, so that ships drawing 23 ft. can enter at all times, whilst vessels drawing 26 ft. can enter at high tide. The tonnage of the port (1922) was 1,265,018. It is unhealthy and Europeans usually reside at Labuan Deli, a few miles up the river. Belawan has constant communication with Singapore and Penang, and Sumatran and Javanese ports. It is 12 miles distant from Medan with which it is connected by a good motor road, and it is also the terminus of the Deli railway, which crosses the channel south of the island by a bridge; it has cable connections.

BELAY: see NAUTICAL TERMS.

BELCHER, SIR EDWARD (1799–1877), British naval officer, entered the navy in 1812. In 1825 he accompanied Frederick William Beechey's expedition to the Pacific and Bering strait, as a surveyor. He subsequently commanded a surveying ship on the north and west coasts of Africa and in the British seas, and in 1836 took up the work which Beechey left unfinished on the Pacific coast of South America. In 1852 he was given command of the Government Arctic expedition in search of Sir John Franklin. This, which proved an unsuitable appointment, was his last commission; he became K.C.B. in 1867 and an admiral in 1872. He published, *Narrative of a Voyage round the World performed in H.M.S. "Sulphur," 1836–1842* (1843), *Narrative of the Voyage of H.M.S. "Samarang" during 1843–1846* (1848; the *Zoology of the Voyage* was separately dealt with by some of his colleagues, 1850), and *The Last of the Arctic Voyages* (1855), besides minor works. He died in London on March 18, 1877.

BELCHER, JOHN (1841–1913), English architect, son of an architect of the same name, was born in London on July 10, 1841. His first important commission—the Royal Insurance offices in Lombard street—was a French Renaissance building (since pulled down), in which he introduced much sculptured work from the hand of Thomas Thornycroft. He designed the block at the corner of Poultry and Queen Victoria street, a building showing how strongly he was influenced at that period by the Gothic movement of which Street and Burges were the prominent exponents. After his father's retirement in 1875, Belcher was in partnership at various times with J. W. James, Beresford Pite and J. J. Joass. His admiration for Norman Shaw was a great factor in his artistic evolution, but even a more powerful one was due to the preparation and study involved in his production, with Mervyn Macartney of the *Later Renaissance in England*. His Electra house, Finsbury, and Whiteley's vast store, Bayswater, are admirable examples of business premises practically conceived, and possessing a fine and dignified architectural treatment. Belcher's ecclesiastical work included Holy Trinity church, Kingsway (1909), an interesting essay in the classic manner, and the Catholic Apostolic church in Maida Vale. He was elected royal academican in 1909, and was president of the Royal Institute of British Architects in 1908. He died in London on Nov. 8, 1913.

BELDAM, a grandmother or remote ancestress, and so an old woman. Generally used contemptuously as meaning an old hag.

BELEMNITES, the name of a group of extinct cephalopod molluscs allied to the squids and cuttlefish (*qq.v.*). The shell comprised a straight cone divided internally into chambers and known as the phragmocone, the whole enclosed in a horny or calcareous plate. It was probably internal as in most modern Decapoda. See MOLLUSCA; CEPHALOPODA.

BELESME, ROBERT OF (c. 1100), earl of Shrewsbury. From his mother Mabel Talväs he inherited the fief of Belesme, and from his father, the Conqueror's companion, that of Shrewsbury. Both were march-fiefs, the one guarding Normandy from

Maine and the other England from the Welsh; consequently their lord was peculiarly powerful and independent.

Robert was the typical feudal noble of the time, circumspect and politic, persuasive and eloquent, impetuous and daring in battle, and an able military engineer; in person, tall and strong; greedy for land, an oppressor of the weak, a systematic rebel and traitor, and savagely cruel. He first appeared as a supporter of Robert's rebellion against the Conqueror (1077); then as an accomplice in the English conspiracy of 1088 against Rufus. Later he served Rufus in Normandy, and was allowed to succeed his brother Hugh in the earldom of Shrewsbury (1098). But at the height of his power he revolted against Henry I. (1102). He was banished and deprived of his English estate; for some time after he remained at large in Normandy, defying the authority of Robert and Henry alike. He betrayed Robert's cause at Tinchebrai; but in 1112 was imprisoned for life by Henry I.

BIBLIOGRAPHY.—See E. A. Freeman's *William Rufus*, and his *Norman Conquest*, vol. iv.

BELFAST, county borough, capital of Northern Ireland. Pop. (1926) 415,151. It is a sea-port of the first rank, at the entrance of the river Lagan into Belfast Lough, 112½m. north of Dublin by rail.

The early history of the site is scanty and vague. In the *Annals of the Four Masters* there is mentioned a battle in A.D. 660 between the Ulidians and Cruithni, fought probably on this site. River fords along the coastal route into North Ireland became of great strategic importance in Norman times. In 1177 a castle was built by John de Courcy commanding a ford over the Lagan near its mouth, and from this date begins the real history of Belfast as a settlement. The next outstanding date is 1316 when the town and castle were destroyed by Edward Bruce. In the early 16th century, Belfast is described as a town and a fortress but was in reality a fishing village in the hands of the house of O'Neill. Edward Fitzgerald, earl of Kildare, twice attacked it during his rising, first in 1503 and later in 1512. The town and fortress were obtained in 1571 by Sir Thomas Smith, a favourite of Queen Elizabeth. It was later forfeited by him to the lord deputy, Sir Arthur Chichester, who in 1612 was created Baron Chichester of Belfast. At this time it was only a town of about 120 houses and a castle in poor condition. In 1611 Chichester built another castle, which was burnt in 1708. A charter was granted to the town by James I. in 1613, constituting it a corporation with a chief magistrate and 12 burgesses and commonalty, with right of sending two members to parliament. In 1632 Thomas Wentworth, earl of Strafford, was appointed first lord deputy of Ireland, and Belfast received certain fiscal rights which he had purchased from the corporation of Carrickfergus. Two years after the rebellion of 1641, a rampart was raised round the town, pierced by four gates on the land side. It will thus be seen that Belfast still retained many of the characteristics of a fortress during the period of its early commercial development, and this dualism in its history is of great significance and importance. The old charter was annulled by James II and a new one issued in 1688, but the old one was restored in 1690 by William III. Letterpress printing was introduced by James Blow and company in 1696 and about this time strategic considerations sank into the background and commercial factors became of outstanding importance.

Shipbuilding at Belfast really began with the enterprises of William Ritchie of Ayrshire, dating from 1791. The earliest records of shipbuilding, however, date back to 1636, when the "Eagle Wing" (150 tons register), was built on the shore of Belfast Lough by a number of Presbyterians of Belfast who wished to seek refuge in the New World. Continuous progress has been made since the early 19th century, and Belfast now is one of the world's chief shipbuilding centres.

A new channel, the Victoria channel, several miles long and 300ft. wide, affording 20ft. of water at low tide and 28ft. at high tide, was cut about 1840. The Alexandra dock, 852ft. long and 31ft. deep, was opened in 1889 and numerous extensions have been made since, a graving dock, one of the largest in the world, being opened in 1911.

The linen industry was much encouraged by the Huguenots,

who came to Ulster after the revocation of the Edict of Nantes. Modern Belfast profited by proximity to Scottish coal and iron, and has become the centre of the industry. The activities connected with the manufacture of linen range from the making of sewing thread to the production of handkerchiefs, tea-cloths and other finished goods. Before the war, large quantities of linen goods were sent from the Continent to be bleached on Ulster greens and then returned for sale. Rope-making, whiskey-distilling, manufacture of aerated waters and of tobacco are other activities.

It was not until 1789 that the town obtained regular communication with Dublin by stage coach, owing to the badness of the roads and the steepness of the hills between Newry and Belfast. Now, however, the Lagan valley has been utilized as an important railway route. The residential areas on Belfast Lough are also connected with the city by rail. There is regular sea communication with Liverpool, Heysham, Glasgow and other ports.

Architecturally, the city inevitably retains signs of its rapid growth. There are, however, some buildings worthy of notice, of which may be mentioned Queen's university, City Hall and the cathedral. The first named is finely situated in its own grounds. The City Hall occupies the site of the old Linen Hall and is in direct touch with many of the principal thoroughfares. Tradition has given way to necessity in the case of the cathedral, the edifice being built on Basilican lines calculated to meet the demands of a large congregation more economically than a Gothic structure. The city has a few statues and monuments one of the best known being the Albert Memorial Clock Tower.

Belfast is divided into four parliamentary constituencies, each returning four members to the parliament of Northern Ireland and one member to the parliament of Great Britain and Northern Ireland.

Queen's university dates from 1909; previously it was Queen's college, a constituent college of the Royal University of Ireland. The municipal college of technology is connected with it. The university gives degrees in arts, science, including civil engineering, law, medicine, commerce, agriculture and applied science and technology. In the year 1923-24 the trustees of the Rt. Hon. J. C. White gave £60,000 to the university for the endowment of departments of bio-chemistry and bacteriology.

BELFAST, a city of Maine, U.S.A., on the north-west shore of Penobscot bay, 30m. from the sea and 85m. north-east of Portland; a port of entry and the county seat of Waldo county. It is served by coasting steamers, and by the Belfast and Moosehead Lake railroad, which connects with the Maine Central at Burnham Junction, 33m. north-west. The population in 1920 was 5,083, of whom 92% were of native parentage. The city lies on an undulating hillside, commanding extensive views of islands, headlands and mountains. It has a considerable domestic commerce, is a summer resort, and manufactures a variety of commodities. The first settlers (1769) were Scotch-Irish; hence the name. It was incorporated in 1773. Almost destroyed by the British in 1779, it was again in British hands for five days in 1814. It was chartered as a city in 1850.

BELFORT, TERRITORY OF, an administrative division of eastern France, formed from the southern portion of the department of Haut-Rhin, the rest of which was ceded to Germany by the treaty of Frankfurt (1871), but recovered by France in 1919. It is bounded on the north-east and east by Haut-Rhin, on the south by Switzerland, on the south-west by the department of Doubs, on the west by that of Haut-Saône, on the north by that of Vosges. Pop. (1926) 96,594.

With an area of 235 sq.m., it is one of the smallest departments of France. The northern part is occupied by the southern offshoots of the Vosges, the southern part by the northern outposts of the Jura. Between these two highlands stretches the Trouée (depression) de Belfort, 15-20 m. broad, joining the basins of the Rhine and the Rhone, traversed by the canal between these rivers, by the Eastern and the Paris-Lyon-Méditerranée Railways and from earliest times an important route from north to south. The northern part rises to 4,126 ft. in the Ballon

d'Alsace, to 3,773 ft. in the Planche des Belles-Filles, to 3,579 ft. in the Signal des Plaines and to 3,534 ft. in the Bärenkopf. South of the Trouée de Belfort, there are near Delle limestone hills, partly wooded, attaining 1,680 ft. in the Forêt de Florimont. The line of lowest altitude follows the river St. Nicolas and the Rhone-Rhine canal. To the north of the town of Belfort the rainfall is retained by an impervious subsoil; farther south it is quickly absorbed by the soil or evaporated by the sun. About one-third of the total area is arable land; wheat, oats, rye and potatoes are the chief crops. Forest covers another third of the surface; the chief trees are firs, pines, oak and beech; cherries are largely grown for the distillation of Kirsch. Pasture and forage crops cover the remaining third of the territory; only horned cattle are raised to any extent. There are copper, silver and lead at Giromagny, and there are also quarries of stone. The chief industries are the spinning and weaving of cotton and wool, and the production of iron and iron-goods and machinery. Belfort has important locomotive and engineering works. Hosiery is made at Delle, watches, clocks, agricultural machinery, petrol (gasoline) motors, ironware and electrical apparatus are manufactured at Beaucourt, and there are numerous saw-mills, tile and brick works and breweries.

Belfort is the capital of the territory, which comprises one arrondissement, 5 cantons and 106 communes, and is in the archbishopric, the court of appeal and the académie (educational division) of Besançon. It forms the 7th subdivision of the VII. Army Corps.

BELFORT, town of France, capital of the territory of Belfort, 275m. E.S.E. of Paris on the main line of the Eastern railway. Pop. (1926) 36,356. The town commands an important structural gap known as the *Trou de Belfort* between the Vosges and the Jura and is one of the main ways from the Rhine country into France. Gallo-Roman remains are found in the vicinity though the place is first heard of in the 13th century as the possession of the counts of Montbéliard. It passed by marriage to the counts of Ferrette and afterwards to the archdukes of Austria. By the treaty of Westphalia (1648) the town was ceded to Louis XIV. who gave it to Cardinal Mazarin.

In the Thirty Years War Belfort was twice besieged. The fortifications of Vauban were begun in 1686. Belfort was besieged in 1814 by the troops of the Allies and in 1815 by the Austrians. The most famous episode of the town's history is its successful defence in the war of 1870-1871. The town is divided by the river Savoureuse into a new quarter on the right bank, and the old fortified quarter, with the castle and public buildings, on the left bank. The church of St. Denis, in the classical style (1727-1750) and the *hôtel de ville* (1721-24) stand opposite the castle. "The Lion of Belfort," a colossal figure 78ft. long and 52ft. high, the work of Bartholdi, is carved on the rock in front of the castle.

The construction of locomotives and machinery, carried on by the Société Alsacienne, wire-drawing, and the spinning and weaving of cotton are included among its industries. Its trade is in the wines of Alsace, brandy and cereals. Belfort is the seat of a prefect. It has tribunals of first instance and of commerce and a chamber of commerce.

Siege of Belfort.—The events before the siege are described under FRANCO-GERMAN WAR. Even before the investment Belfort was cut off from the interior of France, and the German corps of Werder was, throughout the siege, between the fortress and the forces which might attempt its relief. The siege corps was commanded by General von Tresckow and numbered at first 10,000 men with 24 field guns—a force which appeared adequate for the reduction of the antiquated works of Vauban. Colonel Denfert-Rochereau was, however, a scientific engineer of advanced ideas as well as a veteran soldier of the Crimea and Algeria, and he had been stationed at Belfort for six years. He had as a nucleus but few regular troops, but the energy of the military and civil authorities enabled his force to be augmented by national guards, etc., to 17,600 men. The artillery was numerous, but skilled gunners were not available in any great strength and ammunition was scarce. Perhaps the most

favourable circumstance from a technical point of view was the bomb-proof accommodation of the enceinte.

The old fortress consisted of the town enceinte, the castle and the entrenched camp, a hollow enclosed by continuous lines, the salients of which were the castle, Fort La Justice and Fort La Miotte. These were planned in the days of short-range guns, but Denfert-Rochereau understood better than other engineers of the day the power of modern artillery, and his plan was to utilize the old works as a keep and an artillery position. The Perches ridge, whence the town and suburbs could be bombarded, he fortified

MAP OF BELFORT CITY AND THE OUTER FORTS AS THEY WERE IN 1870. Invested and besieged from Nov. 3, 1870, to the Armistice of Feb. 15, 1871, Belfort, under Denfert-Rochereau, resisted the Prussian onslaught. It was afterwards surrendered formally. The French commander made the best possible use of the terrain, strengthening the forts of La Miotte and La Justice and constructing new forts at Des Barres and Bellevue. The Prussians lost heavily.

with all possible speed. On the right bank of the Savoureuse he constructed two new forts, Bellevue and Des Barres. His general plan was to maintain as advanced a line as possible, to manoeuvre against the investing troops, and to support his own by the long range fire of his rifled guns. With this object he fortified the outlying villages, and when the Germans (chiefly Landwehr) began the investment on Nov. 3, 1870, they met sturdy resistance. The first attack of the siege artillery opened, Dec. 3, on the west bank between Essert and Bavillers. As more guns arrived, it was extended from left to right, and on Dec. 13 the Bosmont was captured. The formal siege of the Perches redoubts was then decided upon, and as an essential preliminary, Danjoutin, now isolated, was stormed by the Landwehr on the night of Jan. 7-8. In the meanwhile typhus and smallpox had broken out amongst the French, many of the national guards were impatient of control, and the German trenches made steady progress towards the Perches. A week after the fall of Danjoutin the victory of Werder at the Lisaine put an end to the attempt to relieve Belfort, and the siege corps was promptly increased to a strength of 17,600 infantry, 4,700 artillery and 1,100 engineers, with 34 field-guns, besides the guns and howitzers of the siege train. The investment was now more strictly maintained and on the night of Jan. 20 the French lines about Pérouse were carried by assault, and, the early morning of the 27th a determined but premature attempt was made to storm the Perches redoubts, which cost the besiegers nearly 500 men. After this failure Tresckow once more resorted to the regular method of siege approaches, and henceforward the besiegers fired 1,500 shells a day into the works of the French. But the besiegers were still weak in numbers and their labours were very exhausting. Still, the guns of the attack were now steadily gaining the upper hand, and at last, on Feb. 8, the Germans entered the two Perches redoubts. This success, and the arrival of German reinforcements, decided the siege. The attack on the castle now opened, but operations were soon suspended by the news that Belfort was now included in the general armistice (Feb. 15). A little later Denfert-Rochereau received a direct order from his own government to surrender the fortress, and the garrison, being granted free withdrawal, marched out with

its arms and trains. Moltke says "The town had suffered terribly . . . nearly all the buildings were damaged. The garrison . . . had lost 4,750, besides 336 citizens." Nevertheless, "the defence was by no means at its last stage" at the time of the formal surrender (British Text-Book of Fortifications, 1893). The total loss of the besiegers was about 2,000 men.

See J. Liblin, *Belfort et son territoire* (Mülhausen, 1887).

BELFRY, originally a word used for a movable wooden tower employed in sieges for attacking and scaling city or castle walls; also a watch tower, particularly one that had an alarm bell. In modern usage the word signifies any bell tower, especially if detached, and also the tower chamber in which the bells are placed.

BELGAE, a Celtic people first mentioned by Caesar, who states that they formed the third part of Gaul, and were separated from the Celtæ by the Sequana (Seine) and Matrona (Marne). On the east and north their boundary was the lower Rhine, on the west the ocean. Caesar's statement (*B.C. i. 1*) that the Belgæ differed from the Celtæ in language, institutions and laws, is too sweeping, at least as regards language, for many words and names are common to both. Only the eastern districts would have been affected by invaders from over the Rhine, the chief seat of the Belgæ proper being in the west. T. R. Holmes comes to the conclusion that "when the Roman delegates told Caesar (*Bell. Gall. ii. 4*) that the Belgæ were descended from the Germans, they probably meant that the ancestors of the Belgic conquerors had formerly dwelt in Germany, and this is equally true of the Celtæ; but it is quite possible that in the veins of some of the Belgæ flowed the blood of genuine German forefathers." W. Ridgeway (*Early Age of Greece*, 1901) considers that the Belgic tribes were Cimbri, "who had moved directly across the Rhine into north-eastern Gaul." The Belgæ had made their way over to Britain in Caesar's time, and settled in some of the southern counties. Among their towns were Magnus Portus (Portsmouth) and Venta Belgarum (Winchester).

In 57 B.C., after the defeat of Ariovistus, the Belgæ formed a coalition against Caesar, and in 52 took part in the general rising under Vercingetorix. After their final subjugation, Caesar combined the territory of the Belgæ, Celtæ and Aquitani into a single province (*Gallia Comata*). Augustus, however, finding it too unwieldy, again divided it into three provinces, one of which was Belgica, bounded on the west by the Seine and the Arar (Saône); on the north by the North Sea; on the east by the Rhine from its mouth to the Lacus Brigantinus (Lake Constance). Its southernmost district embraced the west of Switzerland. The capital and residence of the governor of the province was Durocortorum Remorum (Reims).

BELGARD, a town and railway junction in the district of Köslin, in the Prussian province of Pomerania, 18m. S.W. of Köslin. Pop. (1925) 12,422. It is an agricultural centre.

BELGAUM, a town and district of British India, in the southern division of Bombay. It is situated nearly 2,500ft. above sea-level, 245m. S. of Poona by rail, and has a civil and military cantonment. An ancient fortress, dating apparently from 1519, and covering about 100ac. and surrounded by a ditch, has within it two interesting Jain temples. Belgaum is a considerable centre of trade and of cotton weaving, and has a cotton mill, clay, soap and pottery works, and a tannery. Pop. (1921) 48,320.

The district of Belgaum has an area of 4,611 square miles. To the north and east the country is open and well cultivated, but to the south is intersected by spurs of the Sahyadri range, thickly covered in some places with forest. Pop. (1921) 952,996. The principal crops are millet, rice and cotton. There are considerable manufactures of cotton cloth. The West Deccan line of the Southern Mahratta railway traverses the district from north to south.

The ancient name of the town of Belgaum was Venugrama, which is said to be derived from the bamboos that are character-

istic of its neighbourhood. The most ancient place in the district is Halsi, which, according to inscriptions on copper plates discovered in its neighbourhood, was once the capital of a dynasty of nine Kadamba kings. It appears that from the middle of the 6th century A.D. to about 760 the country was held by the Chalukyas. It, or a part of it, was then held successively by the Rashtrakutas, the Rattas, the Kadambas of Goa, the Yadavas of Devagiri, the emperor of Delhi, the rajahs of Vijayanaga, the Bahmani dynasty and the Moguls. In 1776 the country was overrun by Hyder Ali, but was retaken by the Peshwa with British assistance. In 1818 it was handed over to the East India Company and was made part of the district of Dharwar. In 1836 this was divided into two parts, the southern district continuing to be known as Dharwar, the northern as Belgaum.

BELGIAN COAST OPERATIONS. The operations on the Belgian coast carried out during the World War by British naval forces, with the assistance of local French torpedo and auxiliary craft, deserve a special place in history, in view of their important bearing on the Allied effort in general and the British situation throughout that period in particular. The functions of these forces may be summarized as follows: (1) They safeguarded the left flank of the whole Allied line on the Western Front. (2) They materially assisted to prevent the German occupation of the Channel ports to the westward of Nieuport. (3) They formed the outer rampart of the defences of the Dover straits, thereby assisting to protect Channel shipping and to safeguard communication between England and France. Their protection also extended, in some degree, to the examination service and shipping anchored in the Downs. (4) They made possible the laying and maintenance of barrages off the Belgian coast and in the Dover straits, without the latter of which Britain must have succumbed to the submarine attacks on shipping. (5) In conjunction with the left flank of the Allied army, they enabled Franco-British aerodromes to be established in an advanced position, where Allied aircraft could counter German air bases used as jumping off places for air attacks on England and French coast ports. (6) They constituted a constant challenge and reproach to the German navy throughout the war.

The course of the operations may be traced from Oct. 17, 1914, when large German forces, released by the fall of Antwerp, pushed westward towards the coast. Rear-Admiral the Hon. Horace Hood, who was then in command of the Dover patrol, left at once for Nieuport in the small cruiser "Attentive," followed by three shallow-draught monitors, the "Severn," "Mersey," and "Humber," purchased from the Brazilian Government while they were being completed in England.

By the following day the Belgian army had been forced back to a line on the left bank of the river Yser from Nieuport to Dixmude, but still had advance posts in Lombardsyde, Rattevalle and Mannenskevere.

From now onwards the British flotilla was actively engaged and effectively prevented German troops being landed behind this line, while it embarrassed the enemy considerably during the time he was establishing himself on the coast. Middelkerke and Westende were bombarded frequently, as were the coastal roads and such inshore positions as were within range of the ships' guns. Within a week the flotilla was augmented by the arrival of three old sloops of the "Wildfire" class, the old gunboats "Excellent" and "Bustard," the scout "Foresight," the torpedo-gunboat "Hazard" and two or three French destroyers.

Oct. 21 (Trafalgar day), 1914, was a particularly critical one and the naval forces were engaged almost continually throughout the hours of daylight, directing their fire against German troops in movement and in covering the ground over which the enemy was attempting to advance. From time to time ships fell out, with injuries sustained from shore batteries, which engaged them from the cover of the sand dunes. By Oct. 25 the Allied position had become stabilized to a certain extent. The battleship "Venerable" and the old cruisers "Syrius" and "Brilliant" now joined Admiral Hood's forces for a brief period, but, owing to their deep draught, were not found to be very suitable. On Oct. 28 the fierce fighting between Ypres and Armentières was felt right

up to the coast, and the British naval forces were very heavily engaged. The destroyer, "Falcon," the "Mersey," "Brilliant" and "Wildfire" were all hit.

At this time the Belgian army was so hard pressed that, in all probability, only the support and encouragement given by the ships enabled them to hold out. The enemy was continually bringing up more and heavier guns and mounting them under cover of the shore where the ships' guns could not reach them. Nevertheless, the flotilla continued in action during the daylight hours, with little intermission, until Nov. 4. After a short spell of rest, on the 7th of that month it renewed its activity at the request of the French, who proposed making an advance along the coast, but this project did not materialize and the following day the ships were ordered to return to England.

In the early part of Dec. 1914, a scheme was afoot to retake the occupied part of the coast. Amongst other naval preparations the old battleship "Revenge" (afterwards renamed "Redoubtable") was fitted up for bombarding purposes, and made a short appearance, only to retire damaged on Dec. 16 through an 8in. shell from an enemy shore battery. Meanwhile, the position on the extreme flank of the Allied line had been stabilized and a French division had moved up and relieved the much-battered Belgian forces.

A system of observation of fire for the ships from positions ashore was organized in readiness for further naval bombardments. Some naval armed barges on the inland waterways and naval armoured trains also co-operated with the shore forces, while the early part of 1915 saw the beginning of the establishment of a number of heavy British naval guns ashore, to make good, in some measure, the serious lack of heavy, long-range artillery.

Early in April of that year, Vice-Admiral Sir Reginald Bacon relieved Rear-Admiral the Hon. Horace Hood in command of the Dover patrol, as this command was designated. Capt. C. B. Johnson was appointed commodore at Dunkirk. The arrangement whereby the chief command centered in an admiral at Dover and the local, but subordinate, command of the Belgian coast forces in a commodore on the other side of the channel, was not entirely a happy one, particularly for the latter, who was often tethered to a telephone, when it would have been better if he could have exercised his own discretion over matters of immediate importance and in dealing with the situation on the coast. The Dover command had to embrace such varied matters as the patrolling of the straits, the routing of merchant ships and cross-channel traffic within the command area, the safeguarding of shipping in the Downs, the netting and mining of enemy submarines, the local defence of the approaches to Dover and Folkestone harbours, mine-sweeping and mine-laying and local air-work, as well as the direction of major operations off the Belgian coast.

In the course of the year 1915 the Dover command was being continually augmented by various classes of ships. Those more particularly engaged in the Belgian coast operations included two monitors—"Marshal Ney" and "Marshal Soult," each armed with a pair of 15in. guns—six monitors of the "General Craufurd" class, each armed with a pair of 12in. guns—a number of smaller monitors armed with 9.2in. guns—and an array of auxiliary craft, mine-sweepers, trawlers, drifters, coastal motor-boats and motor-launches. The majority of the monitors were based on Dunkirk; the lesser craft, except a squadron of mine-sweepers which also worked from Dunkirk were based mainly on Dover and crossed the Channel for service on the coast as required.

At a later period, in 1916, the monitor squadron was augmented by the arrival of two new ships, the "Erebus" and the "Terror." These were of an improved type armed, like the "Marshal Soult," with 15in. guns, but capable of steaming about 12 knots as against approximately half that speed, which was all that the older monitors, armed with 15in. or 12in. guns, could claim. The propelling machinery of the "Marshal Ney" on the other hand was so unsatisfactory that she was deprived of her main armament and relegated to the duty of a semi-mobile fort at the north end of the Downs.

It is of interest to note that although the German torpedo

flotillas made an occasional raid on the light craft patrolling the Dover straits, and in one instance on vessels anchored in the roadstead off Dunkirk, no serious attempt was ever made by the enemy naval forces against the British flotillas, which were constantly patrolling and frequently attacking the German positions on the Belgian coast. So completely did the French and Belgian military commands rely on the presence of the British navy in those waters that only the most meagre coast defences existed behind the left flank of their armies, whereas behind the opposing right flank the Germans created an intensive system of batteries, including an array of over 300 guns of 6in. calibre and above, between Westende and the Dutch frontier. It was a striking example of the value of sea power and of naval co-operation in support of land forces with a flank resting on the sea.

From 1915 onwards many technical improvements were made in naval bombarding and the salient points at Zeebrugge and Ostend were attacked from the sea on several occasions. One of the most important of these developments was the system of observing and signalling the result of the ships' fire from the air, evolved as the result of experiments carried out by the monitor, "General Craufurd," and a seaplane carrier, the "Riviera." This system changed the whole character of the ships' bombardments and converted what was practically blind shooting into scientific gunnery.

From time to time during the ensuing years schemes were mooted for a general advance along the coast, or for landings from seaward in the occupied territory, but it was generally recognized that the coast was not the place for a main attack, but rather that any efforts there should be made in conjunction with a serious advance by the Allied armies further inland. The most important of the various projects for a landing in force was that prepared by Admiral Bacon early in 1917, preparations for the execution of which were brought to a high state of readiness in the summer of that year. The scheme included the landing of a division of three brigades over huge pontoons, each of the three pontoons being secured to and pushed ahead of two monitors lashed alongside of each other, thereby providing a system for bridging the shallow water between the beach and the ships. At the head of each brigade and carried at the extreme foremost end of the pontoons, were to have been three tanks, specially fitted to climb the sea wall.

An elaborate scheme of smoke screens, navigational devices and covering fire was worked out to aid the landing, but the success of the undertaking was dependent on adequate progress being made by the Allied armies on the main front, and as the latter did not materialize before the season of the year became too far advanced for the landing project to be practicable, it was abandoned, and no later occasion arose for it to be revived.

As the submarine menace grew, so increasing efforts were called for in the Dover command to waylay enemy under-water craft passing the straits and emerging from and returning to their bases at Zeebrugge and Ostend. The work of sinking submarines in the straits was distinct from the operations on the Belgian coast and is dealt with under SUBMARINE CAMPAIGN, but it was very largely due to the naval forces based on Dunkirk that it was possible for the array of light craft working in the narrow waters of the channel to remain so immune from attack.

In the early part of 1916 an elaborate barrage of mine and mine nets was started off the Belgian coast. From then onwards to the latter part of the war this was developed, the work being mostly carried on just outside the range of the heavy batteries, while the small craft engaged in working on the barrage were protected by the guns of the monitors and presence of the attendant destroyers. Day by day a regular procession, consisting of one or more large monitors, sometimes a couple of small ones, half a dozen destroyers and two pairs of mine-sweepers would patrol just to seaward of this barrage, in clear weather well within sight of the whole of the German coast defences. As a challenge to a sea Power of the importance and strength of Germany, this daily patrol must have been almost unique—certainly in modern times.

In practice it is very doubtful whether this barrage was effec-

tive in sinking submarines, for weather and other conditions made a continuous patrol impossible and the enemy therefore had frequent opportunities for clearing a passage through it. Much more successful were the joint efforts of the monitors and bombing aircraft to render the bases at Zeebrugge and Ostend untenable as resting places for submarines, and eventually the latter retreated up the canal, some of them as far as Bruges, heavy concrete shelters being provided to safeguard them from air attack. On the other hand, efforts to destroy the lock gates at Zeebrugge by bombing and gun fire were never successful, the target proving too small.

In Jan. 1918 Vice-Admiral Sir Reginald Bacon was relieved in command of the Dover Patrol by Vice-Admiral Roger Keyes. Commodore Johnson had already been relieved at Dunkirk by Commodore Hubert Lynes in June of the previous year.

Zeebrugge and Ostend Operations.—Early in 1918 it was decided to take still more drastic measures to try and counter the submarine menace, and an elaborate operation was planned, with the object of blocking the canal entrances at Zeebrugge and Ostend and so completely closing the Bruges canal to the Flanders flotilla of submarines. Both these entrances were formed by piers projecting seawards with a deep water channel, about 300ft. wide, between them. At Zeebrugge a formidable stone mole, extending over a quarter-circle, embraced the western approach to the canal entrance. This mole was connected to the mainland by a viaduct mounted on piles. It was defended by a battery of three 5-in. and six 4-in. guns. The attacking force was organized in two squadrons—one to operate against Zeebrugge, and the other against Ostend. The attacks were to be launched simultaneously.

The Zeebrugge force consisted of three block-ships, the old cruisers "Thetis" (Com. R. S. Sneyd), "Intrepid" (Lieut. S. Bonham-Carter) and "Iphigenia" (Lieut. E. W. Billyard-Leake), another old and larger cruiser, the "Vindictive" (Capt. A. B. Carpenter) and two specially fitted Liverpool ferry-boats, the "Iris II" (Com. V. Gibbs) and "Daffodil" (Lieut. H. G. Campbell). Attached to this inshore squadron were 18 coastal motor-boats under Lieut. A. Welman, and 33 motor launches for making smoke screens and for rescue work; also submarine C3 (Lieut. R. Sandford). Behind this force were 13 destroyers under Capt. W. Tomkinson, and the two big monitors "Terror" (Capt. C. W. Bruton) and "Erebus" (Capt. C. S. Wills), while, in general command, was Vice-Admiral Roger Keyes, with his flag in the destroyer "Warwick."

The Ostend force consisted of the two old cruisers "Brilliant" (Com. A. E. Godsal) and "Syrius" (Lieut.-Com. H. N. Hardy), supported by 18 motor launches under Com. I. Hamilton Benn, ten British and seven French destroyers, four large monitors, the "Marshal Soult" (Capt. G. R. B. Blount), "Lord Clive" (Com. R. J. M. Watson), "Prince Eugene" (Capt. E. Wigram), "General Craufurd" (Com. E. Altham) and four small ones, the whole under the command of Commodore H. Lynes.

The block-ships and "Vindictive" were kept out of sight in the Thames estuary until the moment was propitious for launching the attack. Two false starts were made and on one occasion the operation was so far advanced that the monitors' bombardment had already begun; but the wind changed, thereby driving the smoke screen in the wrong direction. Admiral Keyes made the bold decision to withdraw the whole mass of ships rather than commit them to so desperate a project under unfavourable conditions; owing to the admirable organization and communications, this was effected without difficulty.

Attack on Zeebrugge.—On the night of April 22-23, the attack was duly launched. At 11.20 P.M. a long-range bombardment was opened by the monitors and continued for over half an hour. It was found afterwards that this had been most effective in making a large proportion of the garrison take cover, which must have facilitated in no small degree the subsequent work of the inshore squadrons. At 11.40 P.M. the smoke screen was started and at midnight the "Vindictive" reached her assigned position on the seaward side of the Mole. Her mission was to land a storming party, with the object of destroying or capturing the batteries on the Mole and diverting fire from the block-ships.

CRAFT USED IN BELGIAN COAST OPERATIONS AND A VIEW OF THE ZEEBRUGGE MONUMENT

1. Typical heavy-gun monitors. These shallow-draft vessels, each mounting a turret armament and protected against torpedo attack by "bulges," continually threatened and frequently shelled the occupied territory of the Belgian coast, thus greatly lessening its value to Germany as a naval base while also threatening the right flank of the German army.
2. H.M.S. "Gorgon," originally the Norwegian coast defence vessel "Nidros," converted into monitor service toward the close of 1918. It was fitted with bulge protection and supplied with two 9.2-in and six 6-in guns together with several smaller guns.
3. A typical "M.L." (special motor launch). These launches were used for anti-submarine work, making smoke screens, and for a number

of other auxiliary purposes. They also performed gallant service in rescuing the crews from block ships after the Zeebrugge and Ostend operations in 1918.

4. Coastal motor boat at high speed. These were very fast light torpedo craft, used for attacking the enemy's warships and harbours on the Belgian coast.
5. A bombardment at Ostend in 1915, showing the monitors under fire from the German forts.
6. Zeebrugge. Unveiling of the memorial to officers and men of the British navy. The monument was unveiled by King Albert of the Belgians on St. George's day, April 23, 1925, the seventh anniversary of the Zeebrugge raid.

BELGIAN COAST OPERATIONS

THE BLOCKING OF THE ZEEBRUGGE AND OSTEND HARBOURS BY THE BRITISH NAVY

1. H.M.S. "Intrepid" and "Iphigenia" blocking the canal at Zeebrugge. In the distance is shown the gap in the mole
2. H.M.S. "Vindictive" in the entrance to Ostend harbour. The ship made a successful attempt on the port on May 9th and 10th, after the attack in April failed
3. Another view of H.M.S. "Intrepid" and "Iphigenia" blocking the canal at Zeebrugge. In the distance is shown the gap in the mole
4. German defences on the Belgian coast. An 11-in. gun of the Tirpitz battery; behind it, a defence of barbed wire fences is shown

Owing to the strong current and the swell, accentuated by the moving ships, the "Vindictive" had the greatest difficulty in getting close enough to land her men, but the little "Daffodil" came up and saved the situation by "butting" the cruiser amidships, and thereby pressing her against the sea-wall. The storming party, drawn up ready to rush ashore, suffered heavily meanwhile, and lost both its leaders—Com. H. C. Halahan, R. N., and Lt.-Col. B. H. Eliot, R.M.L.I. Eventually, however, the majority got ashore, only to find many difficulties in locating their objectives, including a mass of barbed wire. Severe fighting took place on the Mole during the time the block-ships were passing into the inner harbour. Meanwhile, Lieut. Sandford had rammed his submarine, "C3" between the piles of the viaduct. The vessel was filled with 7½ tons of amatol, which he successfully exploded, the small crew escaping in a collapsible boat, from which they were rescued by Sandford's brother commanding a naval steam launch.

The three blocking ships, running the gauntlet of a hail of shell-fire, made for the canal entrance. The "Thetis" fouled a net and ran aground just clear of the piers, but was able to do useful service in guiding her consorts by signal. The "Intrepid" ran into the canal entrance, and Lieut. Bonham-Carter, having swung his ship across the channel, blew out her bottom with explosive charges, and then, with six others, escaped in a Carley raft, from which they were picked up by a motor launch (M.L. 282, Lieut. Percy Dean). The "Iphigenia" followed soon after and endeavoured to fill the gap left by the "Intrepid" near the eastern bank. She, too, was effectively sunk, her crew being saved by the motor launches.

By 12.50 P.M. the blocking ships were in position and the "Daffodil's" siren gave the order for the storming party to retire on board the "Vindictive." This they did, in good order, bringing some of their wounded with them. Others were unable to return and the casualties were high. Amongst these was Capt. T. M. Palmers, R.M., who waited for missing men and refused to leave the shore.

By 1.30 A.M. the attack was all over; the "Vindictive" and her small consorts had cleared the Mole and had withdrawn, sorely battered, into the night, reaching Dover safely in the early morning. The destroyer "Morning Star" came under a heavy fire and had to be abandoned and sunk. The remainder of Admiral Keyes' gallant command returned safely to their bases after many narrow escapes and thrilling experiences.

Operations at Ostend.—Simultaneously with the launching of the assault on Zeebrugge, an endeavour was made to block the Ostend entrance to the canal. The 12in. monitors engaged the heavy land batteries and enabled the block-ships to run close inshore, but here things went astray. The enemy had moved the position of the mark-buoy off the harbour entrance: this buoy had been relied on, to some extent, to guide the block-ships; moreover, the smoke screen was blown back towards them. They missed the piers and both ships ran ashore three quarters of a mile to the eastward of the entrance. The crews were, however, taken off by the attendant motor launches.

So bitterly did they and their officers feel the failure of their enterprise, that a large proportion begged to be given another chance, and on the night of May 9–10 the "Vindictive," with Com. Godsal in charge, ran in under a very heavy fire and sighted the harbour. The captain was killed, but Lieut. Victor Crutchly was just able to make the entrance to the canal, where the ship grounded and was sunk. The crew were most gallantly saved by two motor launches, commanded by Lieut. G. Drummond and Lieut. R. Bourke, R.N.V.R. The casualties in these two attempts were heavy, amounting in all to 637, including 197 killed, 413 wounded and 27 missing.

Zeebrugge was partially closed for a time and the operations of the Flanders submarines were appreciably hampered thereby. The daring of the achievement had a most disconcerting effect on the German morale, while the continued activities of the naval forces on the coast under the new régime, resulted in the enemy keeping a large number of troops on that flank which might otherwise have been used against the Allies in another and more critical sphere of action. No further attempts were, however, made at

raiding the coast, whilst the efforts against submarines centred more and more in making the Dover–Gris Nez mine barrage effective.

With the general collapse of the German army, the Belgian coast was eventually evacuated. On Oct. 16, 1918, Ostend fell to the Allies. During the morning of that day, destroyers and aircraft had reconnoitred close inshore, but at 11.30 A.M. the remnants of some German forces were still manning a light battery, and Vice-Admiral Keyes withdrew for fear that the presence of the ships would result in casualties to the friendly crowd waiting to welcome them. By 5.30 that evening, however, the king and queen of the Belgians had visited the town. This was the beginning of a general retreat by the enemy from the coast, during which the unruly German forces did much damage to the interiors of the houses. The guns and works generally were disabled or destroyed as far as possible before the evacuation. By the 20th of the month the Belgian coast was completely cleared up to the Dutch frontier, and the active work of the naval forces was therefore virtually at an end.

BELGIAN CONGO (formerly the Congo Free State, *q.v.*), a Belgian colony in equatorial Africa. It occupies the major part of the basin of the Congo and a small part of the basin of the Upper Nile. Area approximately 910,000sq.m.; pop. (1927) whites, 18,169 (of whom 11,896 were Belgian); natives, probably between 8,000,000 and 9,000,000. Official returns gave some 7,500,000, but they were neither exact nor comprehensive.

Bounded on the west by the Atlantic and by Angola, it has a coastline of 25m. only, extending north from the mouth of the Congo, but the northern bank of the Congo estuary is also part of the colony; the southern bank is Portuguese territory. On the north the colony is bounded by French equatorial Africa; north-east by the Anglo-Egyptian Sudan; east by Uganda and Tanganyika Territory; south-east by Northern Rhodesia; south-west by Angola. East and north-east of Tanganyika are the territories of Ruanda-Urundi (*q.v.*) administered by Belgium under mandate.

Physical Features.—The Congo basin is a relatively low plateau, at its lowest point by Lake Leopold II being only some 1,100ft. above sea level. This plateau is bordered by much higher ground which east and west forms mountain chains. On the west the Congo breaks through the Crystal mountains in a succession of rapids and cataracts on its way to the sea; the small coast zone of the colony includes the hill country of Mayumbe. South-west is the northern escarpment of the Angolan plateau where rise the headstreams of the Kasai; south-east is another high, rugged plateau, that of Katanga (*q.v.*), famous for its copper deposits. Here are the head waters of the main Congo. On the east, beginning south of Lake Tanganyika and going north to Lake Albert (Albert Nyanza), the Mitumba mountains—a range with many local names—mark the limit of the Congo basin. This range, which has heights of 10,000ft., forms the western edge of the eastern or Albertine Rift valley, in which lie Lakes Tanganyika, Kivu, Edward and Albert. On the north-east is a plateau-like stretch of country 3,000 to 4,000ft. above sea level, namely the Congo-Nile divide. Only in the north does the Congo basin extend beyond the limits of Belgian Congo; there the colony is for the most part separated from French territory by the river Congo itself and by its affluent, the Ubangi (*q.v.*).

The great central zone of the Congo, bordered as described, is a country of alluvial plains, with few marked elevations, abundantly watered by the Congo river and its effluents and in large part covered with forests both "primitive" and "secondary." The forests occupy the river valleys and are densest in the east and north-east. The forests are, however, exceeded in area by wooded savannahs, which have often a park-like appearance. In these equatorial forests the vegetation is excessively rank; passage has to be forced through thick underwood and creeping plants, between giant trees, whose foliage shuts out the sun's

rays; and the land teems with animal and insect life of every form and colour. Describing the forests of the Manyema country, west of Lake Tanganyika, David Livingstone wrote: "Into these primaeval forests the sun, though vertical, cannot penetrate, excepting by sending down at mid-day a thin pencil of rays into the gloom. The rain water stands for months in stagnant pools made by the feet of elephants. The climbing plants, from the size of a whipcord to that of a man-of-war hawser, are so numerous, that the ancient path is the only passage. When one of the giant trees falls across the road it forms a wall breast high to be climbed over, and the mass of tangled ropes brought down makes cutting a path round it a work of time which travellers never undertake." This description holds good to-day save that

BY COURTESY OF PHELPS STOKES FUND

VILLAGE ON THE LUALABA RIVER IN SOUTHERN BELGIAN CONGO

The huts or houses of the villages of this region are built so as to have a central square which forms the general meeting place and in some cases the chiefs have adopted European conveniences such as chairs and sun helmets

the administration has cut a highway or two through the forests. With the same reservation the description applies equally to the forest eastward from the mouth of the Aruwimi almost to Albert Nyanza. This forest covers some 25,000 sq. m., and into a great part of it the sunshine never enters. It is known variously as the Pygmy forest (from the races inhabiting it), the Aruwimi or Ituri forest (from the rivers traversing it), the Stanley forest (from its discoverer), or the Great Congo forest. By the banks of the rivers occur the "gallery" formations; i.e., in what appears an impenetrable forest are found avenues of trees "like the colonnades of an Egyptian temple," veiled in leafy shade, and opening "into aisles and corridors musical with many a murmuring fount" (Schweinfurth).

The part of the colony within the Nile basin includes some of the volcanic peaks which, north of Lake Kivu, stretch across the rift-valley, Lake Edward, the western shore of Lake Albert, and part of the Semliki river; also part of Ruwenzori (q.v.), the so-called "Mountains of the Moon," with snow-clad heights exceeding 16,500 feet. The colony also includes the western shores of Lakes Tanganyika and Kivu.

The chief geological formation is that known as the Lubilash. It consists, with few exceptions, of red or white sandstone and soft schists. It covers the greater part of the Congo basin or central zone and in places extends into the higher region of older rocks which surround that zone. The Lubilash formation has a thickness of 1,000 or more feet and is believed to have been deposited in a rather shallow sea. In the Kasai region there are underlying rocks of pre-Cambrian and Palaeozoic age; these last-named rocks also form the Crystal mountains. The Mayumbe region (north of the lower Congo) is mainly granite. Only in the coastal zone are there rocks of the Cretaceous and Tertiary ages. Katanga presents a more varied structure than other parts of the colony. Granites form the southern part of the Mitumba range. The other rocks of Katanga range from pre-Cambrian to permo-carboniferous. In the dolomite rocks of the Kambove series which consist of dolomites, sandstones and shales, are the extensive cop-

per deposits for which the Katanga is chiefly noted. The Kundelungu beds, which cover a large area, are formed mainly of coarse arkose sandstones and compact feldspathic quartzites with bands of shale interspersed. In the higher parts of the Kundelungu and Bianco plateau these beds are overlain unconformably by the Lubilash formation.

On and about the equator the temperature varies little from day to day and the mean annual figure at Eala (0° 5' N.) is 76° F., the hottest month being February. Northwards the temperature increases in range and average. The rainfall maxima are in April-May and in October-November, and the precipitation at Eala is 65-70 in.; farther north the double maximum is very strongly marked, December is very dry, and the total rainfall is slightly less. In the coast region and the east highlands there is a marked dry season, July-October. July and August are the coolest months. The climate is quite unsuitable for Europeans in most parts and it clearly has bad effects on the natives as well. Farther south on the Katanga plateau, there is a wider range (16° F.) of temperature and a somewhat lower actual temperature (mean 68° F.); the total rainfall may be 55 in.; little falls between May and September, but the double maximum is not well marked. The Katanga can be inhabited by Europeans.

Flora and Fauna.—The vegetation of this area is still but partially known. The rubber tree (*Funtumia elastica*) and rubber vines (*Landolphia*) of several species are abundant; in the Kasai region are found aberrant *landolphas* which creep a few inches below the soil for 80 to 100 ft. and throw up tufts above ground in the rainy season. Of several species *L. thollonii* is the most valuable. Of plantation rubber, *Ceara* (*Manipot*) and *Hevea brasiliensis* are now cultivated to a small extent. The oil palm is common in many districts as are also the raphia palm and copal tree. There are many timber trees such as mahogany, ebony, teak, lignum vitae, African cedars and planes, redwood and camwood. Gum and resin-yielding trees and plants (such as the acacia) are numerous. Euphorbias attain great size and orchillas are characteristic forest weeds. There are innumerable kinds of moss and lichens, and ferns with leaves 12 ft. in length. Of the creepers, a crimson-berried variety is known as the pepper climber. Orchids and aloes are common. In the savannahs are gigantic baobab trees. In the densest forests the trees struggling through the tangle of underwood to the light are often 150 ft. and sometimes 200 ft. in height. The undergrowth itself rises fully 15 ft. above the ground. In many districts the coffee and cotton plants are indigenous and luxuriant. Of fruit trees the banana and plantain are plentiful and of unusual size. Of grasses the *Imperata cylindrica*, which grows to a height of 6 ft., is widely distributed. Peculiar to the maritime zone are mangoes and the coco-nut palm. Papyrus is found by the river banks; the banks of the lower Congo are often fringed with mangroves.

A broad distinction may be made between the animals of the forests and those of the savannahs, but the elephant is found in both regions, as is the leopard, though one variety of leopard is confined to the forests. Like the elephant, the lion inhabits both the open and the wooded country, though rarely found in the dense forests. The forests are particularly the home of anthropoid apes and of many kinds of monkeys. The chimpanzee is fairly widely distributed in the northern and eastern parts of the country; the gorilla is found in the Kivu region and some other forest districts. In the forests also, but not confined to them, are the wild hog, wolf, lemur and jackal, the python, tree-cobra, tree-viper, and many other snakes. Among animals peculiar to the forest regions are the rare okapi, a tiger-cat about the size of a leopard, the honey-badger (or black Ituri ratel) and the elephant shrew. The rhinoceros is widely distributed, except in the south. Hippopotami and crocodiles are common in the rivers; otters make their home by the river banks. The rivers are well stocked with fish, including varieties resembling perch and bream. The manati is confined to the lower Congo.

The savannahs are the special home of many kinds of antelope and other large ungulates, such as the buffalo, giraffe, zebra and wild ass. Some of the antelopes, including the bongo, are, however, dwellers in the forests. The red dwarf buffalo (*Bos nanus*)

is found in the Ituri forest as well as in the savannahs. The spotted hyena, often of large size and very fierce, is also an inhabitant of the savannahs. Wild cats are very common.

Insects, including bees and wasps, beetles, butterflies and dragon-flies (of gorgeous colouring) are innumerable, also centipedes and spiders. Termites and ants, including the driver ant, are common, and the "ant-hills" of the termites are a characteristic feature of many parts of the country. Mosquitoes are plentiful and include the disseminator of malaria; tse-tse fly is also widely distributed, including *Glossina palpalis*, the carrier of sleeping sickness.

Bird life is abundant; though few of the birds are peculiar to the Congo. Flamingoes and pelicans frequent the larger rivers; herons, hawks, tern, Egyptian geese, fishing vultures (*gypohierax*), the weaver and the whydak bird are more or less common, as are also starlings, cuckoos, eagle-owls and hoopoes. The spur-winged plover is the companion of the crocodile. There are over 20 species of sunbirds and three or four species of parrots, the grey parrots being extremely common.

Administration.—The colony has no representative institutions and is under the control of the Belgian parliament, the direction of affairs being entrusted to the minister for the colonies, assisted by an advisory colonial council which is partly nominated by the Crown, partly by the legislature. The budget has to be voted by parliament. At the head of the local government is a governor-general who has the oversight of matters of common interest. The colony is divided into provinces, each (1928) under a governor, the provinces into districts presided over by commissioners. Native chiefs exercise a large measure of authority over their tribes. But there is, on the one hand, the danger of these becoming simply State officials, and on the other hand, danger in permitting unpleasing customs to persist, such for example as trial by ordeal. Apart from this native jurisdiction there is an independent judicature, with courts of appeal. As reformed after 1910, the working of the courts has given no cause for complaint. For defence the colony has a force, all infantry, of some 16,000 men, the officers and N.C.O.s. numbering about 400, being Europeans.

Education is mainly in the hands of Christian missions, both Roman Catholic and Protestant; some of the mission schools are inspected and aided by the State, which itself maintains a few technical and training schools. The class of educated natives is small, and found mainly in the chief towns. For scientific studies the State maintains a number of agricultural laboratories, experimental farms and botanic gardens, and at these a limited number of natives receive instruction. A native medical service is also trained, as an auxiliary to the European medical service. This service carries out most valuable work among the people, especially in combating sleeping sickness and syphilis.

Towns and Communications.—Just within the mouth of the Congo is Banana, with a fine harbour. It is the oldest trading station in the Congo, European merchants having been established there since the 16th century. On the north bank of the estuary is Boma, formerly the administrative capital. It is the port of the Mayumbe country, with which it is connected by railway. Further up and 93m. from Banana is Matadi (close to H. M. Stanley's old station of Vivi). Matadi is the furthest point reached by ocean-going ships and is the port for the greater part of the colony. From it a railway runs past the cataract region to Stanley Pool, where is Leopoldville-Kinshasa, the capital, with a white pop. (1926) of some 2,000. About 1,000m up river from Leopoldville is Stanleyville, chief town of the eastern province; roughly midway between Leopoldville and Stanleyville is

BY COURTESY OF THE NORTHERN BAPTIST CONVENTION

CHIEF OF THE LONA BATA DISTRICTS

The headdress and the long ornamental robe indicate the comparatively advanced degree of culture reached by these people

Coquilhatville (at the Ruki-Congo confluence), chief town of the equatorial province. Leopoldville has many of the amenities of a European town, but is surpassed in that respect by Elisabethville, the capital of the province of Katanga (*q.v.*).

The Congo and its affluents have over 5,000m. of navigable waters, and there were in 1928 some 2,500m. of railway in the colony. To open up trade the first task was to join the navigable Congo to the ocean by the building of the Matadi-Leopoldville line. There was difficult work in crossing the Crystal mountains, but after nine years' labour the railway, 248m. long, was completed in 1898. With the growth of trade the railway became inadequate, and in 1927 the rebuilding of the line, with better gradients and a shorter track, was begun. Other railways connect navigable stretches of the Upper Congo, and from 1918 it was possible to travel by steamer or rail from the mouth of the Congo to Cape Town. In 1915 a railway was completed from Kabalo, on the Upper Congo, to Albertville, on the west coast of Lake Tanganyika. From Albertville steamers ply to Kigoma, on the other side of the lake, whence traffic passes over the Tanganyika Central railway to Dar-es-Salaam. By this route the eastern and southern parts of the colony have an outlet to the Indian ocean. Another chain of railways gives Katanga direct access to the sea. From the northern terminus of the Rhodesian railways the line was continued (1910-18) via Elisabethville and Kambove (a centre for the copper mines) to Bukama, on the navigable waters of the Lualaba (Upper Congo). This line put Katanga in direct communication not only with Cape Town but with Beira (1,600m. by rail from Elisabethville), and to Beira the Katanga copper was sent. In 1928 however the last link of a railway to connect Katanga with the west coast at Lobito bay was begun. (*See ANGOLA*) By this route Elisabethville is only 1,100m. from a seaport. The year 1928 also witnessed the completion of a railway from Bukama to Ilebo (Port Francqui), on the Kasai river, thus opening up large and fertile agricultural and pastoral regions. Funds were provided for continuing this line from Ilebo to Leopoldville. Several motor and other roads have been made. They are of only local importance except the road from Buta to the Nile at Rijaf (whence steamers go to Khar-toum); on this road there is a regular passenger and goods service. The telegraphic system was neither very extensive nor (up to 1927) very efficient; it was mainly carried on by a small range wireless station. There are air services between Boma and Leopoldville and between Leopoldville and Bukama (via the Kasai river). The colony is in cable communication with Europe.

Economic Conditions.—Under the Free State rule no distinction was made between the State as administrator and as trader and landlord, whether working estates directly or through concessionaires. Great efforts were made to obtain the maximum output of the two products most easily available, namely rubber and ivory. (*See CONGO FREE STATE*.) At the same time the needs of transport and the task of bringing the country under control entailed the raising of large loans. During this period 75% of the revenue was derived from the exploitation of rubber, and much of the remainder from ivory. In 1910, the country having meanwhile been annexed to Belgium, the Free State methods of exploitation were abandoned. In 1908, the last year of the Free State administration, the value of exports, which besides rubber and ivory included palm-nuts, palm-oil, copal and cocoa was some £4,000,000 and the value of imports £2,300,000. The more rational policy adopted by Belgium on its acquisition of the country led to a great amelioration of the condition of the natives, but, not unnaturally in view of their previous experience, did not for some time tend to increase production. It happened that the abandonment of the compulsory collection of wild rubber by the natives coincided with a fall in prices in Europe, and later on plantation rubber from Malaya and the Dutch East Indies very largely supplanted wild rubber. Thus the Belgian authorities were forced to look to other sources for the development of commerce. While wild rubber continued to be collected to a diminishing extent, rubber plantations were started, with fairly good results. Cotton cultivation was tried, but after ten or 12 years was still in the experimental stage; cocoa, mainly pro-

duced in Mayemba, was disappointing; sugar cane planting began in 1926 in the region between Matadi and Stanley Pool and gave good promise; coffee cultivation began about 1920 in the Kivu and Uele (Welle) districts and proved a success. Rice became an important crop, mainly for home consumption by the natives. The gum-copal industry declined, the natives becoming increasingly unwilling to remain in the swamps for the long period essential for the gathering of the copal.

All these were minor undertakings in place of rubber, but the oil-palm became the most important commercial asset of the colony, mining excepted. The quantity and value of palm-nuts and palm-oil exported grew steadily. While still obtained chiefly from wild trees and in the wasteful native manner, better methods have been introduced by a company using large British capital. Of animal products ivory alone was of importance for many years. Elephants continued plentiful—they were still in some districts so numerous as to be a pest—good tusks were obtained, and as a rule the ivory fetched high prices on the Antwerp market. But by 1925 cattle rearing, undertaken first by some settlers in Katanga, had passed the experimental stage and the industry rapidly grew, there being large areas free from tse-tse fly in Katanga, in the region of the great lakes, the Lomani and in eastern Kasai. The colony passed through very trying times in the years of re-organization which followed the annexation by Belgium, and suffered also by the dislocation caused by the World War, but it emerged successfully. Commercial prosperity came with the development of the mineral wealth of Katanga. That province produces large quantities of tin, has both gold and diamonds, controls the world's supply of radium, and has ore sufficient to control the world's supply of cobalt (it produced 750 tons of copper-cobalt alloy in 1925). But it is chiefly famous for its copper. In 1911 the production of copper by the Union Minière, the company which controls the richest fields, was 998 tons; in 1914, with the railway available, the output was over 10,000 tons, and in 1925 it had grown to 80,000—with the capacity, given more and improved machinery, of producing 200,000 tons annually for many years. Besides the mineral wealth of Katanga, gold is worked at Kilo and Moti (which lie towards the Uganda border) and diamonds are obtained from the Upper Kasai region. Diamonds were discovered in 1907; the stones are alluvial, small but of good quality. In 1923 the output was 500,000 carats; in 1924 it was 393,000 carats. Currency in the Congo is that of Belgium, and as the franc was subjected to the same fluctuation as in Belgium, statistics in pounds sterling would be misleading, but the relative progress in the export trade can be seen by comparing the figures for 1913 and 1924. In the first-named year exports were valued at 55,000,000 francs; in 1924 at 477,000,000 (of which 223,000,000 francs was the value of the copper; 43,000,000 francs the value of the gold; 87,000,000 francs the value of palm-nuts and palm-oil, and 31,000,000 francs the value of the ivory exported). Import trade is of a general character, cotton, clothing, provisions and machinery predominating. Over half the total trade is with Belgium; but Great Britain—which takes the copper output—has over 40% of the exports from the colony, and the British empire as a whole over 50%. Of the imports taken by the colony the share of Great Britain is some 15%; of the British empire about 25%. Germany, France and the United States are all considerable exporters to the colony, but take little of its produce, at least directly. Shipping using the colony's ports is largely Belgian; next in tonnage come the French ships. An accurate survey of State finances has been rendered very difficult by the defective system of accounting adopted; complete budget figures for 1918 had not appeared by

1926; the following are, however, given as the figures for the 1924 budget—revenue 182,000,000 francs; expenditure 177,000,000 francs. The consolidated debt in 1925 was 310,000,000 francs, and the floating debt considerably larger. Practically the whole of the consolidated debt is a burden taken over from the Congo Free State. Revenue is derived mainly from direct taxation (including income tax and a poll tax on male adult natives), customs, royalties on minerals, and the sale or lease of lands. By the terms of the Brussels Act of 1910, import duties must not exceed 10% *ad valorem*; they are in some cases specific. The main expenditure is on administration proper, the postal, public debt, educational and medical services and the defence force.

HISTORY

On Nov. 15, 1908, the Independent State of the Congo (CONGO FREE STATE, *q.v.*) of which Leopold II., King of the Belgians, was sovereign, was annexed to Belgium and the personal rule of Leopold gave place to control by the Belgian Parliament, exercised through a Colonial Minister. The Belgian Government took measures to remedy the abuses which had grown up on the Congo, its task being rendered easier by the death of Leopold and the accession of Albert I. in 1909. The restrictions on freedom of trade were removed and most of the monopolies held by Leopold were abandoned. The native administration was thoroughly re-organized. The ancient right of user of the land was restored to the natives and the principle of freedom of labour recognized. The chiefs were granted, with necessary safeguards, much of their traditional authority and judicial reforms were carried through. Missionary efforts were encouraged, further restrictions placed on the liquor traffic, and strenuous efforts were made to combat disease. The thoroughness of the reforms was cordially recognized by Great Britain, the United States, and other interested parties. During the Great War, Congo troops aided the French in the Cameroons; they helped in the defence of Northern Rhodesia, and in 1916 they conquered a considerable area of German East Africa. In 1919 by agreement with Great Britain the mandate over Ruanda and Urundi, part of the region conquered by the Congolese, was assigned to Belgium (*see RUANDA-URUNDI*). By an earlier agreement (1910) Great Britain had ceded to Belgium the western shores of Lake Albert, thus securing to the colony access to the Nile system, which would otherwise have been lost through the retrocession of the Lado Enclave (*q.v.*).

Apart from an enlightened native policy the efforts of the administration were largely devoted to the development of means of communication and of local government. In 1910 the province of Katanga (*q.v.*) was placed under a vice-governor-general with extensive powers. In 1926 the title was changed to governor simply. In 1928 a special committee was formed to develop the Kivu region. To the governor-general of the whole colony was left, however, financial control and matters affecting the colony as a whole. The depression following the war had its effect on the Congo and in 1920 there was a partial strike in the civil service and unrest among several native tribes. These troubles passed with the development of commerce and careful attention to the needs of the natives. By a convention with Portugal, signed in Sept. 1927, Belgium ceded to Angola some 480 sq. m. in the south-west of the Congo colony (an area known as the Dilolo Boot), receiving in exchange something over one sq. m. of territory near Matadi. This strip of land was of much value as it was needed in the rebuilding of the Matadi-Stanley Pool railway—the principal means of communication between the interior and the coast. The extension of the Benguela railway begun in 1928 opened up another route to the sea for the southern part of the colony (*see ANGOLA*). In June 1928 King Albert I. visited the colony for the opening of the completed Bas Congo-Katanga line, 695 miles long, which now connects Katanga with Leopoldville by the Kasai river.

(F. R. C.)

BELGIAN LITERATURE. The literature of Belgium falls naturally into two divisions, Flemish and French. In the early 19th century (*c.* 1830) was established the "Flemish movement" with the object of setting up Low German as the literary and official language. Before this time Flemish literature was one with that of Holland (*see DUTCH LANGUAGE; DUTCH LITERA-*

BY COURTESY OF NORTHERN BAPTIST CONVENTION
WIFE OF A CHIEF IN BELGIAN CONGO
The metal rings encircling her legs are an accepted fashion of adornment

ture). Through many vicissitudes the national movement struggled on, from the recognition by the Academy of Brussels (1772), to the work of Willems (1818 and 1836) and David, founder of the review *De Middelaer*. Several writers set forth their seasoned opinions on the value of Flemish as a natural literary vehicle, dwelling particularly on its historical development. Texts of earlier times were reprinted and edited with care and literary men set on foot an active propaganda in favour of a national tongue.

FLEMISH

At some period near the closing years of the 16th century, the literature of Flanders began to decline, and this was still more noticeable during the 18th century. Flemish sank to the level of a patois. It was not until between 1815 and 1830, when the Belgian provinces were once more united to the kingdom of the Netherlands, that slight signs of a renaissance appeared. It might have been thought that the revolution of 1830 and the régime which was set up after it would have destroyed the movement in its early stages, but the contrary was the case. The Government, aiming at centralization, declared French the only official language of the country and adopted a policy hostile to the use of Flemish or Dutch (for in their literary form the two languages are one and the same). Its policy, however, created a reaction, and this gave rise to the "Flemish movement," which aimed at restoring the language of the people to honour and making it the foundation of a truly national culture.

The movement drew its chief inspiration from J. F. Willems (1793-1846), who, in collaboration with certain scholars of his acquaintance, founded a magazine by means of which he drew the attention of the public to the great classics of Flemish literature, *Reinaert de Vos*, the mediaeval songs, etc. The enthusiasm for the Flemish language which was thus aroused led more imaginative minds to wish to create literary works in Flemish.

The first name which must be mentioned in this connection is that of Hendrik Conscience (1812-83) (q.v.). This author was the real father of the new Flemish literature, to which he gave a great impetus by the publication of one of his earlier novels, *The Lion of Flanders* (1838), a heroic and romantic story of the struggle of the Flemish communes against the French monarchy at the beginning of the 14th century. Side by side with him there sprang up a whole school of poets whose work still shows traces of the rhetorical manner of the Dutch poets of the preceding period. They include Karel Ledeganck (1805-47), who raised Flemish poetry to greater dignity by improving and refining its form. In his poem *The Three Sister Cities* (Ghent, Bruges and Antwerp) he helped to reawaken the Flemish spirit by reminding his compatriots of the greatness of their past and showing that their national characteristics were worthy of respect. He expressed the aspirations of his nation in a sufficiently definite form to impress them on the heart of the people. Another poet of this period was Prudens van Duyse (1804-59), whose numerous works show more fertility of imagination and stronger feeling than Ledeganck's, but less artistic feeling and uniformity of level. Theodoor van Ryswyck (1811-49) wrote in a more popular vein.

The period 1850-75 is less deeply imbued with romanticism. Literature aimed more at realism and stylistic merit. Conscience continued to be the most popular novelist; it has been said of him with justice that "he taught his nation to read." His fertility was inexhaustible, and he supplied the masses of the population with the intellectual and moral nourishment which they required, in the form of novels which are somewhat too conventional in their psychology, but give a pleasing account of the simple ways of life in small towns and villages. More vigorous realism is to be found in the works of Domien Sleenckx (1818-1901), whose view of life is less indulgent. Among the poets, special attention was devoted to artistic form by Dautzenberg (1808-69), a man belonging to the previous generation, whose work is nevertheless best mentioned here. Jan van Beers (1821-88) wrote tales in verse describing the life of the poor. He combines a pure style with realism and strong feeling.

There was, however, at this time another poet who united all the tendencies which have been mentioned—love of nature, sincere

feeling and a characteristic style—but raised them to the plane of pure poetry. This was Guido Gezelle (1830-99), a priest of West Flanders. He treated the language in an entirely new way, incorporated elements from his own dialect, and transformed it into a far more supple and expressive medium than it had been before. His ardent religious feeling and his love for every aspect of his native land are expressed in his work with such wealth and originality of imagery and such subtlety of rhythm that Guido Gezelle is still regarded as the greatest and most original poet of Flemish literature. His first verses were published in 1858, but a crisis in his spiritual development then kept him silent for 20 years. For long his work was recognized only by a small circle, and he did not attain fame until the publication of his last volumes in the 'nineties.

During the period 1875-90 another native of West Flanders, Albrecht Rodenbach (1856-80), a poet of real talent, published poems and a verse drama, *Gudrun*, which showed the greatest promise. In his work the reawakening of Flemish national consciousness is expressed with a passion which aroused the enthusiasm of the younger generation. Unfortunately he died at the age of 24. The leadership of the poetic movement then passed to Pol de Mont (b. 1857), whose work, though more brilliant than profound, was lively and spontaneous and helped to enrich Flemish literature with new subjects. In prose, the novels and short stories of Virginie Loveling (1836-1919) and Reimond Stjns (1850-1905) prepared the way for realism emancipated from all literary conventions.

The tendencies outlined above inaugurated a period of general literary revival, from which critics are agreed in dating the modern Flemish literary movement. The principal organ of the new movement was the review *Van Nu en Straks* (*To-day and To-morrow*), which was founded in 1893. It played the same part in the development of Flemish literature as *La Jeune Belgique* had played ten years earlier in the French literary movement of Belgium. Its contributors included men of the older generation such as Cyriel Buysse (b. 1859), Prosper van Langendonck (1862-1920) and Alfred Hegenscheidt (b. 1866), and also a group of younger writers born in the '70s, who opened up new fields, completed the process of artistic emancipation and struck out boldly in fresh directions. Then opened a period of abundant literary production which continues at the present day. It coincided with the return of Guido Gezelle to literature. The poems which he published during the last years of his life won him recognition as the greatest master of the day, who united the most consummate artistry with freshness and spontaneity.

The poetry of Prosper van Langendonck is imbued with profound human feeling. Alfred Hegenscheidt is the author of *Starkadd* (1899), the finest poetic drama of Flemish literature. Of living poets, the most distinguished is undoubtedly Karel van de Woestyne (b. 1878), who, from the appearance of his first volume in 1903, preserved a consistently high level of production. It is safe to say that his complex and sibylline personality has struck a new note in European literature. Jan van Nýlen (b. 1879) and Firmin van Hecke (b. 1884) by their rare purity of style, are closer to him than any other contemporary poets.

The masters of narrative prose, Cyriel Buysse and Stjns Streuvels (b. 1871), are dealt with in separate articles; the former, as an objective realist, has delineated most truthfully Flemish popular life; the latter, by his poetical treatment, idealizes it. August Vermeylen (b. 1872) has written essays and a philosophical novel, *The Wandering Jew* (1906), that was translated into French, German and Czech. Maurits Sabbe (b. 1873) with his warm sensitive semi-tones, best reproduces the atmosphere of Bruges. Lode Baekelmans (b. 1879), whose humour is broader, brings to life the dock quarter and the picturesque characters of the Antwerp streets. The tales of Fernand Toussaint (b. 1875) are distinguished by a delicate nuance of technique. The novels of Herman Zeirlinck (b. 1879) depart from strict realism; they are imbued with an individual fantasy, which delights in exquisite arabesques. In Van de Waestyne, who has also written several volumes of prose on symbolic themes, the creative imagination reigns alone, remote from reality.

New tendencies, however, are visible in the younger writers of the post-war era. Poets as Wies Moens (b. 1898) and Marnix Ghysen (b. 1899) completely break with all tradition and proclaim absolute liberty of rhythm and image; while Paul van Ostayen (b. 1896), discarding all logical phrases and even all idea of "subject," endeavours to express himself by sound values alone.

Ernest Claes (b. 1885) may be mentioned among the vivid narrators of the present, and Maurice Roelants (b. 1895) among the most ingenious psychological analysts. But the novelist Felix Zimmermans (b. 1886) achieved the greatest popularity, and at the same time won the appreciation of literary critics. His bright, spontaneous style, full of unexpected images which surprise by their very aptness, is combined with delicacy of perception and the true tang of nature. His *Pallieter* (1916) expresses an exuberant *joie de vivre*, the equal of which would be hard to find. His other works also are essentially Flemish in their mixture of frank sensuality and mystical tenderness.

In the theatre, Herman Zeirlinck made, in his later years, the most serious attempt toward a dramatic renaissance: drawing his inspiration simultaneously from the mediaeval moralities and the cinema, he released the drama from the confines of the unities and of immediate reality. His characters are types and mainly allegorical, and thus present all the spiritual elements of action moving in visible form.

Zimmermans, *Anthologie des écrivains flamands contemporains* (1926). (A. V.)

FRENCH

Belgian writers were commonly charged with provincialism, but the prejudice against them has been destroyed by the brilliant writers of more recent years. It was also asserted that Belgian French literature lacked a national basis, and was merely a reflection of Parisian models. The most important section of it, however, has a distinctive quality of its own. Many of its most distinguished exponents are Flemings by birth, and their writings reflect the characteristic Flemish scenery; they have the sensuousness, the colour and the realism of Flemish art; and on the other hand the tendency to mysticism, to abstraction, is far removed from the lucidity and definiteness associated with French literature properly so-called.

The events of 1830-31 gave a great stimulus to Belgian letters, but the country possessed writers of considerable merit before that date. For four years before the revolution André van Hasselt (q.v.) had been publishing his verses in the *Sentinelle des Pays-Bas*, and from 1829 onwards he was an ardent romanticist. A burst of literary and artistic activity followed the revolution; and van Hasselt's house became a centre of poets, artists and musicians of the romantic school. The best work of the Belgian romanticists is in the rich and picturesque prose of the 16th century romance of Charles de Coster (see DE COSTER), and in the melancholy and semi-philosophical writings of the moralist Octave Pirmez (q.v.). Charles Potvin (1818-1902), a poet and a dramatist, is best known by a patriotic *Histoire des lettres en Belgique*, forming vol. iv. of the Belgian compilation, *Cinquante ans de liberté* (1882), and by his essays in literary history. Eugène van Bommel (1824-80) established an excellent historical tradition in his *Histoire de la Belgique* (1880), reproducing textually the original authorities, and also edited a Belgian encyclopaedia (1873-75), the *Patria Belgica*. Baron E. C. de Gerlache (1785-1871) wrote the history of the Netherlands from the ultramontane standpoint.

The whole of this literature derived more or less from foreign sources, and, with the exception of Charles de Coster and Octave Pirmez, produced no striking figures. De Coster died in 1879, and Pirmez in 1883, and the new movement in Belgian literature dates from the banquet given in the latter year to Camille Lemonnier (q.v.), whose powerful personality did much to turn "Young Belgium" into a national channel. Lemonnier himself cannot be exclusively claimed by any of the conflicting schools of young

writers. He was by turns naturalist, lyrist and symbolist; and it has been claimed that the germs of all the later developments in Belgian letters may be traced in his work. The quinquennial prize of literature had been refused to his *Un mâle*, and the younger generation of artists and men of letters gave him a banquet which was recognized as a protest against the official literature, represented by Louis Hymans (1829-84), Gustave Frédéric (b. 1834), the literary critic of *L'Indépendance belge*, and others. The centres around which the young writers were grouped were two reviews, *L'Art moderne* and *La Jeune Belgique*. *L'Art moderne* was founded in 1882 by Edmond Picard, who had as his chief supporters Victor Arnould and Octave Maus. The first editor of *La Jeune Belgique* was M. Warlomont (1860-89), known under the pen-name of "Max Waller." This review, which owed much of its success to Waller's energy, defended the intense preoccupation of the new writers with questions of style, and became the depository of the Parnassian tradition in Belgium. It had among its early contributors Georges Eekhoud, Albert Giraud, Iwan Gilkin and Georges Rodenbach. Edmond Picard (b. 1836) was one of the foremost in the battle. He was well known as an advocate in Brussels, and made a considerable contribution to jurisprudence as the chief writer of the *Pandectes belges* (1886-90). His *Pro arte* (1886) was a kind of literary code for the young Belgian writers.

Georges Eekhoud (1854-1927) was in some ways the most passionately Flemish of the whole group. He described the life of the peasants of his native Flanders with a bold realism, making himself the apologist of the vagabond and the outcast in a series of tragic stories: *Kees Doorik* (1883), *Kermesses* (1883), *Nouvelles Kermesses* (1887), *Le Cycle patibulaire* (1892), *Mes Communions* (1895), *Escal Vigor* (1899) and *La Faneuse d'amour* (1900), etc. *Nouvelle Carthage* (1888) deals with modern Antwerp. In 1892 he produced a striking book on English literature entitled *Au siècle de Shakespeare*, and has written French versions of Beaumont and Fletcher's *Philaster* (1895) and of Marlowe's *Edward II.* (1896).

The earlier work of "Young Belgium" in poetry was experimental in character and provoked much hostile criticism. The young writers of 1870 to 1880 had not long to wait, however, for recognition both at home and in Paris, where many of them found hospitality in the pages of the *Mercur de France* from 1890 onwards. They divided their allegiance between the leaders of the French Parnassus and the Symbolists.

The most powerful of the Belgian poets, Émile Verhaeren (q.v.), was the most daring in his technical methods of expressing bizarre sensation, and has been called the "poet of paroxysm." His reputation extends far beyond the limits of his own country.

Many of the Belgian poets adhere to the classical form. Albert Giraud (born at Louvain in 1860) was faithful to the Parnassian tradition in his *Pierrot lunaire* (1884), *Pierrot narcissé* (1891) and *Hors du siècle* (1886). In the earlier works of Iwan Gilkin (1858-1924) the influence of Charles Baudelaire is predominant. He wrote *Damnation de l'artiste* (1890), *Ténèbres* (1892), *Stances dorées* (1893), *La Nuit* (1897) and *Prométhée* (1899). The poems of Valère Gille (born at Brussels in 1867), whose *Cithare* was crowned by the French Academy in 1898, belong to the same group. Émile van Arenberghe (born in Louvain in 1854) is the author of some exquisite sonnets. Fernand Séverin (b. 1867), in his *Poèmes ingénus* (1900), aims at simplicity of form and with Séverin is closely associated Georges Marlow (b. 1872), author of *L'Âme en exil* (1895).

Georges Rodenbach (1855-98), author of *Bruges la Morte* (1892), spent most of his life in Paris and was an intimate of Edmond de Goncourt. The best part of his production is the outcome of a passionate idealism of the quiet Flemish towns in which he had passed his childhood and early youth.

The most famous of all modern Belgian writers, Maurice Maeterlinck (q.v.) made his début in a Parisian journal, the *Pléiade*, in 1886. He succeeded more nearly than any of his predecessors in expressing or suggesting in his poems, and more particularly in his early plays, ideas and emotions which might have been supposed to be capable of translation only in terms of

music. Maeterlinck was a native of Ghent, and the first poems of two of his fellow-townsmen also appeared in the *Pléiade*. These were Grégoire le Roy (b. 1862), author of *La Chanson d'un soir* (1886) and *Mon Coeur pleure d'autrefois* (1889), and Charles van Lerberghe (b. 1861), author of a play, *Les Flâieurs* (1890), a collection of *Poèmes* (1897) and *La Chanson d'Ève*, one of the finest of Belgian poems.

Max Elskamp (born at Antwerp in 1862) is the author of some volumes of religious poetry—*Dominical* (1892), *Salutations, dont d'angéliques* (1893), *En symbole vers l'apostolat* (1895)—for which he has devised as background an imaginary city. Eugène Demolder (b. 1862) also created a mythical city as a setting for his prose *contes* in the *Légende d'Yperdamme* (1897).

(E. G.; X.)

Belgian literary activity extends also to historical research. Baron Kervyn de Lettenhove (1817–91) wrote a *Histoire de Flandre* (1847–55), and a number of monographs on separate points in Flemish and English history. Though an accurate historian, he allowed himself to be prejudiced by his extreme Catholic views. He was a vehement defender of Mary Stuart. Louis Gachard (1800–85) wrote many valuable works on 16th century history; Mgr Namèche (1810–93) completed the 29th volume of his *Cours d'histoire nationale* before his death. Among modern Belgian historians, the names of Godefroid Kurth and Henri Pirenne, author of the well-known *Histoire de Belgique*, are pre-eminent. One of the most masterly writers of French in Belgium was the economist Émile de Laveleye (q.v.).

Belgian literature, which was so flourishing at the beginning of the 20th century, suffered some severe losses during the next two decades. Charles van Lerberghe, the greatest Belgian poet after Verhaeren, died prematurely in 1907. The powerful novelist, Camille Lemonnier, died in 1913, his last works being a tragedy, *Edénie* (1912), and a symbolic story *Au Coeur Frais de la Forêt* (1913). Émile Verhaeren died in 1916. More recently Edmond Picard, a well-known lawyer and critic, who exerted a considerable influence on the younger generation, Iwan Gilkin, one of the founders of *La Jeune Belgique*, and Georges Eekhoud were lost to Belgian letters. To these names should be added those of several writers of great talent and promise who were killed fighting for their country. Some of their writings have been collected in *Les Écrivains belges morts à la guerre*, an anthology published in 1912.

War Literature.—The World War itself inspired a great amount of literature both inside and outside Belgium. Most of these productions have only an historical interest, others deserve to be considered as contributions to Belgian letters. Among the latter must of course be included all the writings of Maeterlinck and Verhaeren. A soldier poet, disciple of Verhaeren, Maurice Gauchez came to the fore with *Les Rafales* (1917), and Émile Cammaerts published in London a series of poems, *Belgian Poems* (1915), *New Belgian Poems* (1916) and *Messines and other Poems* (1918), which attracted a great deal of attention.

The most interesting productions of War literature are, however, those which were written during the four years of German occupation (1914–18) or immediately after the deliverance of the country. A. Giraud and Max Elskamp published two notable books of poems, *Le Laurier* and *Sous les tentes de l'exil* (1923), and the historian, H. Pirenne, *Souvenirs de captivité en Allemagne*. Among other prose works were the anonymous *Lettres d'un provincial ou les propos du conseiller Eudoxe*, a satire on German administration after the style of Pascal, *L'œil sur les Ostrogoths* by E. Verlant, the war memories of M. Lekeux, a Franciscan monk who fought as an officer of artillery, *Mes cloîtres sous la tempête*, and a collection of War impressions by two young writers, Lucien Christophe, *Aux lucurs du brasier*, and R. Vivier, *La plaine étrange*.

While, in former days, literature was practically ignored by the State, several institutions were founded in order to stimulate its activity. In 1920, a Belgian academy of French language was established by royal decree which published critical studies on Belgian literature and awarded prizes for essays on set questions or for any book of verse or prose worthy of encouragement.

Certain endowments were entrusted to it, such as that of the French Société des Auteurs et Compositeurs of a biennial prize for dramatic literature. The academy passed resolutions which were acted upon by the Government and undertook an enquiry into the situation of the French language throughout the world.

Most of the 14 original members of the academy formerly belonged to the group of *La Jeune Belgique*, and at the end of this period were already looked upon as writers of the older generation. Among them were: G. Eekhoud, a story writer of Flemish peasant life, and the author of several translations and criticisms on the Elizabethan drama whose work *Perkin Warbeck* appeared in 1914; the Parnassian poet, Albert Giraud, who, besides *Le Laurier* mentioned above, published *Eros et Psyche* in 1920 and *Le concert dans un musée*; F. Séverin, who was particularly successful in his descriptions of Walloon countryside (*La source au fond des bois*); the poet essayist A. Mockel (*La flamme immortelle*, 1924), and two accomplished novelists and story-writers of Walloon extraction: H. Krains (*Mes amis*, 1921) and L. Delattre (*Du côté de l'ombre*, 1924).

The influence of art, so powerful on Belgian literature, reasserted itself in later years owing to the constant interest shown by the Belgian public in modern and ancient painting. Among the poets and playwrights who, more recently, devoted part of their time to art criticism are: G. Le Roy in *James Ensor* (1922); A. Goffin in *L'Art religieux en Belgique* (1924); and G. Vanzype in *L'Art Belge du 19ème siècle* (1923), *Henri de Bruckeleer* and *Rubens*.

It has often been noticed that the delight they take in description had somewhat hampered the talent of Belgian novelists. This may account for the fact that, in the writers of this period, as in the former generation, poems and dramatic works were generally above the level reached by novels, though writers of Walloon extraction were less inclined than their Flemish colleagues to mistake their pen for the brush. Among the most distinguished works of the latter since the War may be mentioned H. Stiernet's *Le roman d'un tonnelier*, H. Davignon's series of novels dealing with Anglo-Belgian relationship, L. Piérard's *Les trois borains*, G. Garnir's *La Chanson de la rivière*, E. Glesener's *Les dytiques* and R. Dupierreux's *La certitude amoureuse*; among the former, the most original writers are: H. van Offel (*Les deux ingénus*), F. Hellens (*En écoutant le bruit de mes talons*), and A. t'Serstevens (*Le vagabond sentimental*).

Poetry and the Drama.—It is almost impossible to classify the various tendencies which inspired the work of the modern poets. On the one hand there is a remarkable group of religious poets such as V. Kinon (*L'âme des saisons*), P. Nothomb (*Portes du ciel*), Th. Braun (*Le beau temps*), P. Fierens and G. Raemaekers who illustrate the mystical side of the Belgian temperament; on the other, the group of "La Renaissance d'Occident," headed by M. Gauchez (*Hymne à la vie*) who exalt the joy of life, following the realistic tendencies of Verhaeren. A certain number of poets, like Marie Gevers (*Missembourg-Antoinette*) and E. Cammaerts, *Poèmes intimes* (1922), insist on the intimacy of home life; others, like E. Marcuse and L. Kochnitzky (*Elégies bruxelloises*), follow impressionist and humoristic tendencies. R. Verboom, M. Thiry and N. Ruet may be mentioned among the most promising poets of the younger generation.

In dramatic literature the loss of Verhaeren must again be deplored; his last tragedy, *Hélène de Sparte*, was given in Paris in 1912. Maurice Maeterlinck has given: *The Burgomaster of Stilemonde* (1918), produced in England by Sir J. Martin Harvey; *The Betrothal* (1918), a sequel to *The Blue Bird* (1910), played in London in 1921; and two plays in modern setting. *The Cloud that Lifted* and *The Power of the Dead* (1923). Maeterlinck's amazing success in Paris, 30 years ago, was almost repeated, in 1920, by a young Belgian playwright, F. Crommelynck, whose semi-grotesque, semi-tragic play, *Le cocu magnifique* (1921), created a sensation at the Théâtre de l'Oeuvre. This author, who seems strongly influenced by the biting humour of Pieter Breughel, published more recently two other plays: *Les amants puérils* and *Trippes d'or*. G. Vanzype, a writer of problem plays who remained steadfastly faithful to his high standard, added three more, *Les*

semaillies, Les visages, Les autres, to his already lengthy list of works. The dramatic power of Belgian writers can also be seen in P. Spaak's *Malgré ceux qui tombent* and G. Rency's *La dernière victoire*, while such works as H. Soumagne's *L'autre messie* (1924) and P. Demasy's *La tragédie de Faust* and *Jésus de Nazareth* (1924) showed that this power was by no means exhausted among the younger generation. There are few essayists in Belgium, but certain criticisms such as those of J. Destrée, L. Dumont-Wilden, G. Charlier, F. Ansel and C. Bernard are of real and permanent interest.

BELGIOJOSO, CRISTINA TRIVULZI, PRINCESS (1808-1871): see TRIVULZI-BELGIOJOSO, CRISTINA, PRINCESS.

BELGIUM (Fr. *Belgique*; Flem. *België*), an independent constitutional State occupying an important economic position in north-west Europe. Its neutrality was guaranteed by the treaties of 1831 and 1839, but was abolished by the Treaty of Versailles (1919), when Belgium was given full freedom in directing her foreign policy. It was formerly part of the Low Countries (*q.v.*). The name Belgium came into general use only with the foundation of the modern kingdom in 1830, but its derivation from ancient times is evident. The first Belgic tribes, considered to have been Celtic, reached the area from the region between Elbe and Rhine about the 4th century B.C.; but at the time of the Roman conquest they were considerably mixed with Germanic elements. From the Roman use of *Gallia Belgica*, the adjective came to distinguish the inhabitants of the south Netherlands.

STREET OF WORKMEN'S COTTAGES IN THE ANCIENT BELGIAN CITY OF BRUGES

Even in its obscure streets Bruges retains much of its medieval character. Much of its building dates from the 14th century. The spire in the background is that of the church of Notre-Dame

During the crusades and throughout the middle ages the term *Belgicae Principes* frequently occurs, and when in 1790 the Brabançons rose against Austria, their leaders proposed to give the country the name of "États-Belgiques unis." In 1814, too, on the expulsion of the French, the creation of an independent State under that name was suggested. It was not until 1830, on the collapse of the united kingdom of the Netherlands, that the proposal was given effect. The lack of linguistic unity in Belgium reflects the complex origins of the people. Flemish, a Germanic tongue, is spoken in the two Flanders (West and East), in the provinces of Antwerp and Limburg and in the northern half of Brabant, *i.e.*, in the area corresponding to the territory invaded

by the Franks in the 4th century A.D. French and its "Wallon" *patois* are spoken throughout the south of the country. Dating from the Roman occupation, this language has maintained itself here owing to the broken and forested nature of the country.

From 1830 until shortly before the war of 1914, French was the sole official language of the country. At the present time the two languages have equal rights. Belgium lies between 49° 30' and 51° 30' N., and 2° 32' and 6° 24' E., and is bounded by Holland on the north and north-east, by Prussia and the grand duchy of Luxembourg on the east and south-east, by France on the south and west, and by the North sea on the north-west. Its frontiers measure 1444.5 km., divided as follows: Holland (449.5); Prussia (161.5); Luxembourg (148.0); France (620.0); North sea (65.5).

Geology—Belgium lies upon the northern side of an ancient mountain chain which has long been worn down to a low level and the remnants of which rise to the surface in the Ardennes, and extend eastward into Germany, forming the Eifel and Westerwald, the Hunsrück and the Taunus. Westward the chain lies buried beneath the mesozoic and tertiary beds of Belgium and the north of France, but it reappears in the west of England and Ireland. It is known as the "Hercynian chain," and is composed entirely of palaeozoic rocks. Upon its northern margin lie the nearly undisturbed cretaceous and tertiary beds which cover the greater part of Belgium. The latest beds involved in this mountain folding belong to the coal measures, and the final elevation must have taken place towards the close of the Carboniferous period. The fact that in Belgium jurassic beds are found upon the southern and not upon the northern margin indicates that in this region the chain was still a ridge in Jurassic times. In the Ardennes the rocks which constitute the ancient mountain chain belong chiefly to the Devonian system, but Cambrian beds rise through the Devonian strata, forming the masses of Rocroi, Serpont, Stavelot, etc. These outcrops correspond to transverse folds. The Ordovician and Silurian are absent here, and the Devonian rests unconformably upon the Cambrian; but along the northern margin of the palaeozoic area, Ordovician and Silurian rocks appear, and beds of similar age are also exposed further north in consequence of successive denudations which have worn down the Hercynian folds and swept away the tertiary deposits. Carboniferous beds occur in the north of the palaeozoic area. Near Dinant they are folded amongst the Devonian beds in secondary synclines, but the most important band runs along the northern border of the Ardennes. Here are the coalfields of Liège, Charleroi and Mons, in a long narrow trough which is separated from the older rocks of the Ardennes by a great reversed fault, the *faille du midi*. Tangential movements along a thrust plane inclined to the south have resulted in the northward thrust of a large portion of the Devonian beds of the Ardennes, which thus rest on younger formations, notably on the coal beds in the middle of the trough. Borings at Pepinster have reached coal at a depth of 700 metres. The coal beds to the north of the great fault have therefore a different structure from those to the south.

Another consequence of tectonic movements was the transverse anticlinal dome of Samson, which, in lifting the lower beds, brings the carboniferous limestone to the surface, interrupting between Namur and Andenne the coal deposits of central Belgium.

Soundings carried out in the Campine (north-east Belgium), a few years before 1914, revealed the existence, at a depth of several hundred metres, of coal deposits thought to be of very great importance. During the World War the pits of Winterslag produced the first coal, extracted from a depth of between 450 and 800 metres. Except along the southern border of the Ardennes, and at one or two points in the middle of the palaeozoic *massif*, triassic and jurassic beds are unknown in Belgium, and the palaeozoic rocks are directly and unconformably overlaid by cretaceous and tertiary deposits. The cretaceous beds are not extensive, but the wealden deposits of Bernissart, with their numerous remains of *iguanodon*, and the chalk of the district about the Dutch frontier near Maastricht, with its very late cretaceous fauna, are of special interest.

Exclusive of the Ardennes the greater part of Belgium is cov-

ered by tertiary deposits. The eocene, consisting chiefly of sands and marls, occupies the whole of the west of the country. The oligocene forms a band stretching from Antwerp to Maastricht, and this is followed towards the north by a discontinuous strip of miocene and a fairly extensive area of pliocene. The tertiary deposits are similar in general character to those of the north of France and the south of England. Coal and iron are by far the most important mineral productions of Belgium. Zinc, lead and copper are also extensively worked in the palaeozoic rocks of the Ardennes.

Physiography.—Weakness of relief is the characteristic of the general physiography of Belgium. The railway which traverses the country diagonally from Ostend to Arlon appears, to the traveller, to follow a horizontal floor, varied here and there by wooded or grass-grown hills, and cut superficially into shallow furrows, with winding rivers. Heights of 700 metres are attained in the east, but erosion has levelled the ancient structural relief so that the aspect of a plain is dominant. Topographically the country is usually divided into three regions: lower, middle and upper Belgium. The first division has marked individuality; it comprises the northern plain and is approximately one-third of the total area of the country. The two remaining regions constitute a continuous plateau, the old mountain-remnant referred to under *Geology* (see above), rising above the long trench of the Sambre and the Meuse, which is often taken as the orographical boundary between the two divisions.

(1) The Northern Plain. From the sea-coast to the parallel of Brussels and Louvain the average height of the land does not exceed 20 metres. It consists of a plain of erosion swept by water-courses which run from south-east to north-west. The rivers wind in large curves, several of which have been cut off, at a level higher than that of the surrounding country. A few lines stand out in relief: such as the hills of Flanders, south of Ypres and Courtrai, owing their conservation to a capping of marly pliocene sandstone which has retarded the effects of erosion. One of the knolls is Mont Kemmel (151 metres) which acquired fame through attacks by the German armies in 1918. Other hills include the plateau of Waes, a remnant of the tertiary surface on the left bank of the Schelde, the Campine, a fragment of the alluvial core of the Meuse on the left bank of this river, and finally, scattered throughout the eastern area, the relics of sandy hills which represent quaternary dunes of Continental origin.

(2) The Plateau. This is divided into two parts: the low plateau north of the Sambre-Meuse, and the high plateau south of this hydrographic trough. The low plateau, which in places falls abruptly to the northern plain, rises from 80 to 200 metres in a distance of 55km. The surface is only slightly varied in the east (Hesbaye), where the underlying chalky rocks and the covering of permeable marl do not favour the development of a drainage system. In the west, on the other hand, in the provinces of Brabant and Hainaut, the sandy and gritty tertiary formations have been worn into peculiarly shaped little valleys by a dense network of streams.

The high plateau begins at a height of 200 metres on the right bank of the Meuse and rises gradually to 500 metres about the headwaters of the Ourthe and the Lesse. Thence it slopes southwards to regain a height of from 200 to 300 metres at the frontier. The Ardennes plateau is thus an immense roof-like structure, with its slopes regularly inclined to north and south. Along the crest rise several isolated domes of greater altitude, aligned from south-west to north-east, notably: the *massif* of Libramont-Saint-Hubert (587 metres), Baraque Fraiture (651 metres), Baraque Michel (675 metres), and the plateau of Botrange (692 metres). These residual cores have escaped the general denudation of the rest of the plateau; their conservation is due not to the resistance of the outcrops (in fact composed of easily-decomposed Cambrian schists) but to the tectonic arrangement of the region. The great Armorico-Variscan folds are affected by transverse folds which have exposed the deeper layers of rock. These schists have suffered little erosion because of the resistant crust of phyllites and quartzo-phyllites of Silurian and Gedinian (Lower Devonian) date which has long covered them. A compact

impermeable clay results from the decomposition of the Cambrian schists. Since, moreover, the absence of slope impedes the running-off of rainwater, the flat surfaces develop large pools of stagnant water which give rise to the peat-bogs called "Hautes Fagnes."

The high plateau does not present a uniform aspect in all parts. Varying tectonic influences and different soils have given several "natural regions" of marked individuality. The chief arc, from north to south: the Condroz, the Famenne, the Ardennes and Belgian Lorraine.

The Condroz is characterized by features such as occur typically in the Appalachians or the Jura, with ridges of grits alternating with valleys carved out of the limestone. Phenomena of *karst* (*causse*) type—depressions, grottoes, subterranean streams—are well developed.

The Meuse, which winds in a deep slot across the limestone scarps, has given this region many picturesque sites, and the tourist industry is well developed. The Famenne, an extended depression lying west-east among Devonian schists, is an area of natural woodlands, largely cleared and transformed into meadowland. The Ardennes plateau constitutes the oldest surface of the country, with streams flowing in wide open valleys having very little slope. The climate is fairly rigorous and natural resources poor, and population is here sparsest. Next to the south comes Belgian Lorraine, a land of alternating layers of soft and resistant secondary rocks, with a relief of *cuestas*, for the most part much weathered.

The tourist industry in the lower parts of Belgium, where the scenery is for the most part monotonous, takes a different turn, for here are the old cities with their relics of mediaeval greatness: Bruges, Antwerp, Louvain, Brussels, Ghent, Courtrai, Tournai, Oudenarde and Liège. Ypres and Furnes, almost entirely destroyed during the World War of 1914-18, have been rebuilt in mediaeval style.

Climate and Hydrography.—The climate of Belgium is temperate: regional differences are due to the neighbourhood of the sea and to the influence of relief. At Ostend the mean annual temperature is 49.3°, while at Baraque Michel (670 metres above sea-level) the figure is 43.2°. The average number of days with frost is 50 on the coast, as against 134 in the Ardennes. The Campine, despite its low-lying position, has 94 days with frost, owing to distance from the sea. The rainfall increases towards the interior; the average on the coast is 27.5 in.; at Baraque Michel it rises to 59.5 in. The greatest amount of snow falls in the Ardennes where depths of 27 in. have been recorded.

The hydrographic system is very well developed, and is maintained throughout the year by the abundant rains. The general direction of flow, following the slope of the plateau, is towards the north; and the Meuse, as far as Namur, the Houyoux and the Ourthe all flow northwards until they reach the east to west corridor of the Sambre-Meuse. This feature appears to be the result of successive "captures" of consequent streams made by subsequent valleys. The tributaries of the Schelde: Lys, Dendre, Senne, Dyle, Gette and the Schelde itself from Tournai to Ghent, also flow in northwards following the slope of the low plateau. All these rivers, like those of the Ardennes, are superimposed, *i.e.*, they lay originally on a different surface from that in which their beds are now cut.

The lower courses of the rivers have very little slope, and consequently disastrous floods were formerly common. Artificial regulation has been introduced in many cases, but the rivers break their banks occasionally. Regulation of the watercourses frequently went hand in hand with their canalization. Belgium possesses about 1,000km. of natural navigable water, *i.e.*, over half the total length of the navigable system. There are, in addition, five canals with a total length of 155km., and 740km of canals "à petite section," for the use of barges. In proportion to area, Belgium stands next to Holland among European countries for the density of its navigable water system. Commerce derives a great advantage from this fact, for the rates of transport are cheaper than for rail-traffic.

The shallowness of the North sea (the five-fathom line runs at

a distance of 10 km. from the coast) and the complete absence of coastal indentations are unfavourable to the establishment of good seaports. Moreover, the existence of sandbanks near the shore seriously impedes navigation. The port of Antwerp compensates, in part, for the disadvantages of the coast; but sore limitations are imposed by the fact that the approach to the port is through foreign territory.

Area and Population.—The area comprises 3,044,401 hectares, or about 11,755 English square miles, and the total population in Dec. 1925 was 7,811,876, giving an average of 655 per square mile.

The nine provinces	Area in English sq. m.	Population at end of 1925	Population per sq. m., 1925
Antwerp	1,093	1,101,454	1,008
Brabant	1,268	1,611,952	1,271
Flanders E.	1,158	1,119,591	967
Flanders W.	1,240	865,006	693
Hainaut	1,437	1,258,358	876
Liège	1,501	949,301	632
Limburg	930	330,656	356
Luxembourg	1,706	222,195	132
Namur	1,413	353,363	250
Total	11,755	7,811,876	

In 1925 there were 3,859,600 males and 3,952,216 females. The annual rate of increase is as follows: from 1880 to 1890, 54,931; from 1890 to 1900, 62,422; from 1900 to 1910, 73,023; from 1920 to 1925, 34,609. In 1831 the population of Belgium was 3,785,814.

The emigration figures are: 1900, 13,492; 1920, 53,307; 1925, 35,271; of Belgians living abroad the estimated figures for France and Holland are respectively 350,000 and 30,000. The number of Belgians in the Congo State in 1925 was 7,700. In 1920 the following numbers of foreigners were resident in Belgium: French, 67,309; Dutch, 39,051; Germans, 7,960; British, 6,246; other nationalities, 29,111.

The following table gives statistics of the languages spoken by the people of Belgium for the five censuses of 1880, 1890, 1900, 1910 and 1920

	1880	1890	1900	1910	1920
French only	2,230,316	2,485,072	2,574,805	2,833,334	2,850,825
Flemish only	2,485,384	2,744,271	2,822,005	3,220,662	3,185,100

The three languages	13,331	13,185	42,889	52,547	33,862

Belgium is a densely populated land. In the middle ages, cultivable spaces failed to suffice the constantly increasing population; cultivation spread at the expense of wooded areas. Whole forests have thus been cleared, such as the great coalfield forest which extended from the sources of the Senne and the Dyle to Brussels and Louvain, and of which the forest of Soignes is a remnant.

Along the coast, a strip of land was reclaimed from the sea by means of dykes, and these polders still form one of the most fertile regions in the country. In the eastern districts, the sandy, waste *landes* have been fertilized, and have yielded harvests for many centuries. These great enterprises are in large measure due to the monks who erected monasteries from the 12th century onwards.

In West Flanders, the small rural houses are freely disseminated. Farther east and in central Belgium they cluster along the roads or on the rivers, or are grouped into hamlets. In the pastoral "Fagnes" the agglomerated type similarly predominates. Finally, in Hesbaye and the Condroz, regions of large farming, and in the Ardennes, with less favourable climate and more varied surface, the habitations are concentrated into compact nuclei.

The occupation of the inhabitants, pastoral, agricultural, semi-agricultural, semi-industrial, accounts for these regional varieties.

The large farms include interesting types, notably the Flemish farms with numerous buildings quite separate from each other. Nearly all the farms of the polders are surrounded by a wide, deep moat, filled with water. In south Belgium the farms are built in a large closed quadrilateral or *cense*. The dwelling-house and farm buildings surround an interior court. In the villages of the Hesbaye, four or five such farms cluster around a common pool. Intermediary in type is a class of farm in which the buildings are separate from each other but united by walls or palisades which create a closed court similar in type to that of the *cense*.

The small dwellings of the rural labourer have regional distinctiveness from their building materials. Thatch and white-washed clay were in general use, until the 19th century, in every part where hard stone was lacking: *i.e.*, over all the northern part of the country and, in the south, in the Famenne, with Devonian schists, and on the outcrops of Cambrian schists. The relation of the dwelling to the *milieu* is most striking on the high plateau, where stone houses alternate with dwellings of earth.

GOVERNMENT AND ADMINISTRATION

Education is free and universal for children from six to 14 and is under State control in three divisions: primary, intermediate and higher.

Primary education is given by communal schools and by unofficial schools which may, or may not, be adopted by the commune. In 1925 there were 8,329 primary schools with 795,285 pupils apart from unofficial schools. The school population is declining with the decline of the birth-rate. The normal duration of primary school life is eight years and the work is in four grades: inferior, intermediate, higher and pre-professional. Primary schools are subject to inspectors who are either cantonal or principal (over a number of cantons). Bishops appoint inspectors for religious instruction in communal or subsidized schools. Some of the unofficial schools are maintained by the Church and the bishops appoint inspectors for these. These are administered with primary education schools for children maintained by the State and various schools for adults. The "Écoles Normales" have charge of the preparation of teachers through a five-years' course, the two first years being purely preparatory. One may not enter an École Normale before the age of fourteen. It is possible, however, to become a recognized teacher without passing through this training by successful performances of tests administered by a special jury. In 1925 there were 81 *écoles normales*, official or approved, and they had 11,876 pupils.

Intermediate education comprises 132 official schools, 17 communal or unofficial schools, 24 athenaea four communal or unofficial colleges. The first are officially inspected, the others have special inspectors. The Namur cadet school serves the sons of officers. Intermediate "sections normales" prepare pupils for the qualifying examination for teachers in the lower sections of the intermediate schools.

Higher education is given in universities, official at Ghent and Liège, unofficial at Brussels and Louvain; there are also other institutions. Each university has faculties of letters and philosophy, science, law and medicine and also a faculty of technology; Louvain has a faculty of theology. In 1925-26 there were 8,961 students (Ghent, 1,624; Liège, 2,409; Brussels, 1,637; Louvain, 3,291), of whom 1,833 were foreigners. Each university has a commercial school and special commercial schools of this grade have been created at Antwerp, Liège and Mons. Mons also has an engineering school, Verviers one of textile engineering, Gembloux, Ghent and Louvain (the university) have schools of agricultural engineering. Curegham has a veterinary school and

4. A baker paying for the right of way in a street in Flanders. His cart is dog-drawn, a common occurrence in this part of Belgium
5. The fish market at Brussels, during the early morning shopping hour

Brussels has a preparatory school for officers, and an "École de guerre," which trains the general staff of the army. There are schools of navigation at Antwerp, Nieuport and Ostend, and a stationary training ship is placed at Ostend, in addition to the training ship which goes to sea. Industrial schools are increasing in number every year, and there are special schools of architecture, painting and music. The Royal Academy of Fine Arts at Antwerp, the royal conservatories at Brussels, Antwerp, Ghent, Liège and Louvain, are the chief of numerous institutions for the arts.

The Royal Academy of Belgium was founded in 1769 and revived in 1818 and the prizes awarded through it for literature and science are keenly contested.

Administration and Justice.—Executive authority vested in the king is delegated to his ministers whom he appoints and dismisses, the practice being that he follows the parliamentary majority in making, and changing, the executive. The kingdom has nine provinces each with *arrondissements* subdivided into communes. Only the province and the commune are recognized officially; they have maintained some measure of autonomy and have their own budgets, under royal control. Each province has a governor appointed by the king and a provincial council popularly elected. The commune has its popularly elected council under a *bourgemestre*, appointed by the king usually from the majority party on the council.

The *Cour de Cassation* at Brussels has a first president, sectional president and 15 councillors divided into two sections for civil and for criminal cases respectively. This court is not called upon to judge facts save in a case involving a minister of State, such cases being reserved to it. Its duty is to annul judgments of other courts and tribunals if procedure has not been proper or if they contain a contravention of the text of the law. It confirms judgments that are found correct on these grounds and may act on appeal by a party to the judgment or on its own initiative. There are appeal courts at Brussels, Ghent and Liège, with civil and criminal sections in each.

Civil tribunals of first instance and correctional tribunals in the capitals of *arrondissements* judge cases of a certain importance. Criminal, political and press cases are judged by the assize courts partly composed of professional judges and partly of citizens without legal training. The tribunals in the capitals of judicial *arrondissements* hear appeals from the civil and police tribunals of the communes. The two sections in the communes, save at Brussels and Antwerp, have the same personnel. There are 230 judicial communes, including those of Eupen, Malmedy and St Vith recently added. The number of magistrates has recently been reduced on grounds of economy and some communal tribunals have been found unnecessary. Capital punishment is legal but is never carried out. The number of prisons needed is diminishing.

Since 1921 the senate includes (1) members elected by universal suffrage of all adult citizens over 21 with six months' residence in the commune in which they vote; (2) members elected by provincial councils; (3) members elected by the senate itself. To be a member of either chamber one must be a citizen with political and civil rights, resident in Belgium. The age limit for membership of the chamber of representatives is 25, for membership of the senate 40. Senators directly elected must have some diploma or must practise one or other of a number of intellectual functions named in the constitution. The senate is renewed completely every four years and senators receive no honorarium, but they travel free on State railways and have an allowance of approximately £46 (8,000 francs) for expenses. The king's sons, or, if there are none, the heir presumptive and the princes of his branch, become senators at the age of 18. The members of the chamber of representatives are elected for four years and have an allowance of about £143 (25,000 francs) and free travel on State railways. Voting is obligatory and secret. The electors have to choose between lists put forward by political parties and may not vote for persons from two lists. Seats are divided among the candidates on the various lists according to the votes cast for these different lists. Complications in the system allow a small group to add together votes received in various districts. In this way the

Flemish Nationalists hold six and the Communists two seats in a chamber with three principal parties (1928): Catholics (78), Socialists (78), Liberals (23). (A. Mr.)

FINANCE

Post-War Situation.—War expenditure was incurred without legislature control, and no account had been drawn up by the end of 1927. During the occupation the Germans levied war contributions on Belgium amounting to 2,620,000,000 gold fr.; in addition they exacted 68,000,000fr. from the communes. Belgian indebtedness to the Allies amounted to 5,600,000,000 gold marks. This was placed to German account by the Treaty of Versailles, but the United States were not signatories of the treaty. The Treaty of Versailles further allotted to Belgium a priority of two milliard gold marks on Repatriation account.

Upon the German evacuation the Belgian Government decided to redeem the marks in circulation on the basis of 1.25fr., as German currency had been imposed upon the people. A sum of 7,592,000,000fr. was required to effect this redemption and this was the beginning of Belgian inflation. The government never printed notes, save in the crisis of 1926, to cover the Budget deficit; it even repaid 600,000,000fr. of the advances received from the National bank for the exchange of marks. The Allies did not agree to place to German account the cost incurred for the redemption of German marks circulated during the occupation, but Belgium did not lose all hope of, at any rate, a partial indemnification for her losses.

In 1919 the fiscal system, which had been in force for a century, was recast. The previous direct taxes were replaced by an income-tax modelled on the English income-tax. It comprises three direct taxes—the tax on land, the tax on investments and the tax on salaries and earnings—together with a supertax.

After the war Belgian finance passed through a period of exceptional gravity, lasting throughout 1919 and 1920. Then a vigorous effort towards improvement was made, ending in 1925 with what might be described as complete recovery. In 1926 a new crisis occurred.

The situation in 1919 was due to the German invasion and to necessary expenditure on making good the destruction caused by the War. The material restoration of the country was practically completed by 1924; up to June 30 of that year the State had spent about 21,000,000,000fr. on damage done by Germany, not counting the cost of buying in the marks.

In view of the incompleteness of the public accounts, the best means of judging Belgian finance since the Armistice is to follow the progress of the public debt, external debt being calculated at the same rate of exchange. The figures for the financial years, beginning in September of each year are as follow.—

	Increase (Milliard frs.)
1919-20	5.5
1920-21	6.0
1921-22	2.5
1922-23	1.0
1923-24	0.2
1924-25	1.0

These figures exclude the American debt, reinstated in the Belgian National Debt in accordance with the agreement of 1925.

The increase of 1,200,000,000fr. between 1923 and 1925 is balanced by the increase in State assets. Important new works were constructed on the railways and in the Port of Antwerp.

The budgetary situation was good in 1925. The corrected Budget (excluding State monopolies) was as follows.—

Ordinary Budget	deficit 70,000,000 fr.
Extraordinary Budget	deficit 273,000,000 fr.
Reparations Budget	surplus 511,000,000 fr.

The general Budget after paying off 350,000,000fr. of the public debt, closed with a surplus of 168,000,000fr.

On Aug. 18, 1925, Belgium concluded with the United States an agreement on the American debt. This is to be repaid by the year 1987, by means of annuities reaching the sum of \$12,700,000 from 1936 onwards. The War debt is not subject to interest, while the debt incurred since the War bears a rate of interest calculated at 1.35% up to 1934, and at 3½% in subsequent years.

By an agreement made with Great Britain, Dec. 31, 1925, the total debt of Belgium and of the Belgian Congo to that country (£12,600,000) is to be paid within 30 years, the interest being 5%.

The weak point of the financial situation in 1925 was the floating debt, which was composed of 5,500,000,000 francs of Treasury bonds at six months, to which might be added 1,800,000,000 bonds at five years, falling due Dec. 1, 1926. The elections of April 5, 1925, which were a victory for the Socialists, shook public confidence; immediately capital began to flow out, Treasury bonds were withdrawn, and the franc fell.

In view of this situation, M. Janssen, the Minister of Finance in Pouillet's "Democrat" cabinet, attempted to stabilize the Belgian franc. He drew up a plan, and from Oct. 1925 to March 1926 kept the rate of the pound sterling on Brussels provisionally at 107fr., by means of temporary foreign credits, pending a loan of 150,000,000 dollars. Unfortunately confidence was not restored and capital continued to withdraw. M. Janssen was obliged to utilize £25,000,000 in keeping the franc at the level determined on; at the same time, the floating debt was being gradually called in. The foreign bankers, dissatisfied with the state of opinion in Belgium, and loth to float a loan on the New York market, withdrew their offers. On March 15, 1926, the franc was left to its own devices. A panic followed; in April it became necessary to print further notes to meet the demands for repayment of Treasury bonds. The franc fell steadily. M. Janssen resigned, and on May 20, 1926, the Jaspar-Franqui ministry was formed, which immediately imposed new taxation, the yield of which was earmarked for a sinking fund. When the pound sterling reached a rate of 240fr. (July 12), the Government brought forward an Act granting the King "emergency powers" for six months to grapple with the crisis. On July 31 the compulsory consolidation of the floating debt and the exchange of Treasury bonds against railway shares was decreed.

On Oct. 25, 1926, the Government ordered the second stabilization at a rate of 175 to the pound sterling, or one-seventh of par. The operation was perfectly successful; there was a steady influx of gold into Belgium.

Situation in 1927.—The Budget for 1927, although it had to meet expenditure higher than was originally estimated, closed with a considerable surplus, which will be applied to the sinking fund for the public debt. On Sept. 30, 1927, the total Belgian public debt amounted to 56,190,000,000fr. (£320,000,000). The consolidated debt amounted to 51,000,000,000fr., or 90% of the total. The internal debt amounted in round figures to 27,500,000,000fr., the foreign debt to 28,700,000,000fr. The Budget for 1928 (in millions of francs) was as follows:—

Budget.	Revenue.	Expenditure.	Balance.
	fr.	fr.	fr.
Ordinary	8,798	7,531	1,267
Extraordinary (proper) (reparations)	17 1,068	372 567	—355 501
Posts, telephones, etc. (working profits)	680	703	—23
Posts (initial outlay) . . .	1	110	—109
Total	10,564	9,283	1,281

The budget of the railways is absolutely independent; they have to meet the cost of the initial outlay. Their financial charges have been estimated at 540,000,000fr., 405,000,000fr. of which go to the State and 135,000,000fr. to the shareholders.

The national wealth of Belgium amounted in 1927 to 280,000,000,000fr. (£1,600,000,000), and the income to 42,000,000,000fr. (£240,000,000). State and local taxation absorbs 20% of the national income, or 15% if that part which is set aside for redemption of the public debt be deducted.

DEFENCE

Historical.—The history of defence forces in what is now Belgium can be traced back to the feudal states of the 13th and 14th centuries; through the period of unification of the Netherlands (1363–1477), the Habsburg rule (1477–1555), the Spanish rule and the revolt (1555–1609), the Spanish Netherlands (1609–1714), the Austrian rule (1714–90), the French rule (1792–1814), the junction with Holland (1814–30), and through an independent period (1830–39) until it was formally, in 1839, created the Kingdom of Belgium. Under the provisions of treaties signed in London on Nov. 15, 1831, and April 19, 1839, the frontiers of Belgium were established, and Great Britain, France, Prussia and Russia prescribed that Belgium should "form an independent and perpetually neutral state. It shall be bound to observe such neutrality towards all other States." The Powers mentioned guaranteed to the king of the Belgians the execution of this and of other articles of the Treaty.

In 1868 the active army was divided from the reserve. In 1870 a Militia Act was substituted for all previous legislation affecting military service. From 1896 voluntary military service was established, and in 1902 certain privileges were granted to add to the attractions of the army. In 1909 the principle of compulsory service for one son in each family was adopted, service with the active army being reduced to 15 to 24 months, according to the arm of the service. The peace strength of the army was 42,800. In 1912 an Army Act was passed to increase the military strength of Belgium, and in 1913 compulsory service was made universal, with certain exemptions, the object being to produce a field army of 150,000, 130,000 garrison troops and a reserve of 60,000. The World War broke out before these reforms could take effect, and found the Belgian army unprepared.

Nevertheless Belgium did her best, with the reserves available, to maintain the neutrality enforced upon her by treaty obligations, placing one division facing Germany, one facing France, one facing England, one holding Antwerp, and one, with a cavalry division, in reserve. The heroic but inadequate defence of Belgium and the portion of Belgian territory that remained against the German invasion of 1914 belongs to the story of the World War (*q.v.*). (See also ANTWERP, SIEGE OF; BELGIUM, INVASION OF; YSER, BATTLE OF THE.) At its conclusion, certain territories were ceded by Germany, and the independence of Belgium was again recognized in the Versailles Treaty of 1919.

Present-day Army; Recruitment and Service.—Every Belgian is now liable to military service, exemptions only being granted for physical disability. The ranks of the army are filled by an annual contingent of conscripts, supplemented by voluntary enlistments and by re-enlistments. Obligation for military service begins in the year of the 20th birthday. This may be anticipated by a year, and certain arrangements are made for suspension of service. Service is for 15 years in the regular army and its reserve, followed by 10 years in the territorial army—25 years in all. The regular army is divided into a first-line, comprising the regular units on a peace footing, and a second-line, including reserve units. There is a second reserve, common to both armies, and also auxiliary troops. In the event of war or of threatened invasion, the territorial army can be embodied in the regular army, but married men with four children are exempt from this obligation.

Service with the colours for training lasts for 10 months excepting in anti-aircraft artillery and engineers (12 months) and in cavalry, artillery and horse transport (13 months). Militiamen, fit only for auxiliary service, serve for 12 months. After serving with the colours, the men proceed on permanent furlough, but the Government has the power to recall one or more contingents to the colours. Parliament must be notified of such action. The men on furlough can be called out annually for inspection, and, under normal conditions, conscripts of both armies are recalled twice for periods of six weeks on each occasion. Voluntary enlistment is permitted from the age of 16 years, for periods varying from two to four years, followed by voluntary re-engagement for a period of six months after service with the colours, or, alternatively, for longer periods up to a total of four years.

Strength and Organization.—The budget effective strength of the army in 1927 numbered 66,411, including 4,411 officers. The *gendarmérie* in 1927 numbered 148 officers and 5,900 other ranks, total 6,048. The military organization provides for army troops, including a light division, an army artillery division, military air force, a tank regiment, signals, torpedo-boat and naval corps, and the usual transport and auxiliary services. There are four army corps, each comprising corps troops and four infantry divisions. There are nine regiments of cavalry, of which five are embodied in the light division.

Colonial Troops.—In addition to the army in Belgium, Colonial native troops are maintained in the Congo Territory. These, in 1927, numbered 16,810, including 426 officers and non-commissioned officers. The officers and senior non-commissioned officers are Europeans. Six battalions of infantry, five batteries of artillery, five companies of engineers, and two cyclist companies are kept in cantonments for defence; companies varying in strength are distributed about the districts to maintain order. A colonel, under the direction of the governor-general, commands the Congo forces.

Higher Command.—The king commands the Belgian army in time of war, the minister of defence in peace. There is a general staff for the army, inspectors general for each arm of the service, a Council of National Defence, presided over by the chief of the general staff, an army committee, under the defence minister, and various technical commissions and committees.

Distribution of Troops.—Belgium is divided into four territorial military areas: No. I West and East Flanders and Hainaut, No. II. Antwerp and Limburg; No. III. Liège, Namur and Luxembourg, No. IV. Brabant. Territorial groups are arranged for each group to provide proportionate numbers of Flemings and Walloons and of townsmen and countrymen, for specified infantry divisions and other formations. To these the men are distributed without regard to race or to place of origin.

Education and Training.—The military educational and training establishments in Belgium include (1) the staff college, (2) a military school for training regimental officers; both at Brussels; (3) a cadet school with (4) a central school of science attached thereto; both at Namur; (5) *Ecoles de Pupilles*, which bear their share in preparing non-commissioned officer candidates for the army. Of these there are two of primary grade at Bouillon (French) and at St. Trond (Flemish), and two of intermediate grade at Marnette (French) and Alost (Flemish). For the various arms, schools of instruction are provided at Beverloo (infantry), at Brasschaet (cavalry and artillery) and at Antwerp (engineers). There is a physical training institute at Brussels, one special non-commissioned officers school for infantry in each army corps area, schools for artillery non-commissioned officers at Malines and Borsbeek with cavalry and engineer schools attached thereto. There are also special schools for medical and administrative service, for motor, aviation and railway work, signals and torpedo and naval work.

Special Armament and Training Doctrine.—The Ministry of Defence contains a department to deal with gas warfare service. Military training is dealt with by Section A. of the second deputy chief of the general staff. No special doctrine has recently been disclosed. Each infantry division contains a machine-gun battalion. The light division (army troops) contains two light brigades, one cyclist regiment, one group of machine-gun armoured cars, one regiment of horse artillery, one battalion of cyclist engineers and a light division depot. The army troops artillery division contains a heavy battery on railway mountings, and artillery groups carried in motor lorries. The special railway, telegraph and telephone corps is independent; it is commanded in time of war by a military delegate to the minister for railways.

Permanent Fortifications.—The permanent defences of Antwerp, Liège and Namur proved inadequate in 1914 in face of modern appliances for transporting heavy howitzers. As far as is known, no permanent fortifications of more recent type exist in Belgium.

Army Air Forces.—The military air service is commanded by an officer of divisional rank, reporting direct to the minister of

defence. The service includes a headquarters staff, three air regiments and a depot. One regiment contains four groups of three or four flights, the other three groups of three flights, with a "park flight" in each group. There are 22 aeroplane flights and four balloon flights in all. There is also a Department of Civil Aviation, which since Feb. 1925 has been attached to the Ministry of Railways. The arrangements for the military air-service are still provisional and experimental.

ECONOMIC DEVELOPMENT

Belgium is more highly industrialized than any country on the continent of Europe with the exception of Saxony. In the second half of the 19th century, *i.e.*, between the two great censuses of 1846 and 1900, the industry of the country underwent a fundamental change through the immense increases which took place in the numbers of the working class, and, more especially in the amount of motive power employed. Leaving the transport industries out of account, the total steam power increased more than tenfold in this period, namely from 40,000 to 430,000 horsepower.

In the period 1911-26, Belgian industry continued to progress in the same direction in spite of the World War and the military occupation. Since the war, the amount of available energy has been increased by means of various improvements, so that comparison is difficult, but it is probably not an over-statement to put the increase in the aggregate motive power of industry at not less than 65%, the most noteworthy additions being in the coal-mining, metallurgical, glass-making and textile industries, and in the power-producing industries themselves. The increase in the power used in, and produced for certain industries is as follows—

Industry	Power in kilowatts.	
	1910	1926.
Coal-mining	208,200	415,726
Metallurgical industries	146,041	187,858
Glass, glassware	18,225	41,535
Textile.	107,106	124,830
Special electricity works	91,815	448,867
	572,377	1,218,816

The commerce of Belgium is very large in proportion to her population. The statistics for 1913 and 1926 are as follows—

SPECIAL IMPORTS INTO BELGIUM IN MILLION FRANCS

Year.	
1913	5,050
1926	24,000

SPECIAL EXPORTS FROM BELGIUM IN MILLION FRANCS

Year.	
1913	4,716
1926	19,501

The special commerce takes into account only the produce and the consumption of Belgium itself.

Mining.—In the southern coal-fields, which have been worked for a long time, production tends to decrease. The exploitation of the northern coal-field, the Campine district, is, on the contrary, of comparatively recent date, and this area has a great future before it. In all the Belgian mines machinery is being increasingly employed, and the result may be judged from the following table—

OUTPUT OF COAL IN BELGIUM

Year.	Tons.	Index (1913=100%)
1913	22,841,590	100.0
1919	12,481,880	80.8
1920	22,388,770	98.0
1925	23,097,040	101.3
1926	25,319,570	110.8

Iron and Steel.—Iron and steel were greatly injured by the destruction due to the war, but like many other industries, it is actually in a better position than before, owing to the replacing of the equipment destroyed by new and improved kinds, as the following statistics show:—

BELGIAN PRODUCTION OF PIG-IRON		
Year.	Tons.	Index (1913—100%)
1913	2,484,690	100.0
1925	2,542,507	102.3
1926	3,399,260	136.8

BELGIAN PRODUCTION OF CRUDE STEEL		
Year.	Tons.	Index (1913—100%)
1913	2,404,780	100.0
1925	2,480,000	103.1
1926	3,289,410	136.7

Similarly, in the metal construction and machinery industries—although precise statistics are lacking—it is evident that resources have been considerably developed. The development of the electro-technical industry is especially remarkable.

Zinc and Lead.—New mineral industries have arisen, tin, cobalt, electrolytic copper and radium production. The raw materials come from the Belgian Congo. The supply of uranium discovered in the province of Katanga has given Belgium a decisive preponderance in radium production. The drop in prices which followed the opening of the Oolen works (Campine district), which deal with the Katanga minerals, has led to the closing of a number of foreign undertakings of a similar kind.

Glass-making.—Use of mechanical methods is being rapidly developed, the processes employed being those invented respectively by the Americans Libby and Owens and the Belgian Fourcault:—

PRODUCTION OF GLASS IN BELGIUM		
Year.	Square Metres.	Index (1913—100%)
1913	41,709,000	100.0
1923	36,325,000	87.1
1924	41,000,000	98.3
1925	41,803,000	100.4
1926	52,251,000	125.0

Textile Industries.—In this group the number of working-class factories grew greatly after 1910. The "Filatures et Tissages" of the celebrated co-operative organization "Vooruit" is the largest business of the kind in Belgium.

The cotton industry possessed 1,492,000 spindles in 1914 and 1,891,854 at the beginning of 1927.

The linen industry, which drew its supplies very largely from the Baltic provinces of Russia, suffered in an especial degree from the scarcity of raw material. These difficulties have become less acute; the industry has been able to establish relations with Latvia and Esthonia and has made a rapid recovery. Belgium's artificial silk industry was the most important in the world before the war. It has been outdistanced by those of the United States, England, Italy and Germany, but still occupies an important place.

Diamond Cutting.—The specifically Belgian industry of diamond-cutting is carried on in Antwerp, which in 1926 was the leading city of the world in this respect, having outstripped Amsterdam and the German, French and American centres of the industry. Antwerp handles a very large part of the output of the diamond mines of the Congo and of Portuguese Angola.

Summary.—To sum up, the chief features in the development of Belgian industry, regarded as a whole, are as follows: (1) Concentration and integration, especially in the iron and steel, machine construction, quarrying, cement, ceramic (tile-making), chemical, sugar and cotton industries; (2) development of mechanical processes in the coal, iron and steel, ceramic and glass industries; (3) the Belgianization of certain undertakings—iron and steel, zinc, metallurgy and chemical products—through the liquidation of the foreign, and especially the German, interests; (4) the introduction of new kinds of manufacture, machinery, chemical products, artificial silk (acetate process), radium, etc.; (5) a considerable increase in the interest of the Banque Belge in the national industries, and, as a result of its influence, a tendency towards concentration and combination, both vertical and horizontal, (6) an extended use of electrical motive power.

Electricity Supply.—The following table shows the advance made in the supply of electricity by private undertakings in Belgium (communal undertakings are not included) as shown by the generating capacity of the central station, the capital employed, the number of units sold, and the development of main and secondary systems.

	1911.	1926.
Population served	1,476,000	5,134,000*
Generating capacity (kilowatts)	79,325	780,000
Capital invested (thousands of fr.)	71,117	1,023,000
K.R. hr. sold (thousands)	85,170	925,000
Secondary systems (kilometres)	1,938	13,600
Main systems (kilometres)	500	8,073

*More than 6,500,000, if the large public undertakings are included.

Internal Communications.—The internal communications of Belgium of every kind are excellent. Roads outside the provinces of Luxembourg and Namur are generally paved. In the provinces named, or in other words, in the region south of the Meuse, the roads are macadamized. The total length of roads is about 6,000 miles. There are about 6,800 miles of railways, in which the State has an interest of 20,000 million francs. There are also electric and steam tramways in all the principal cities. The total of navigable waterways is given as 1,360 miles.

Various schemes are in existence for the electrification of Belgian railways, but the immense amount of capital required and political considerations have deferred them.

Labour.—Before the World War, Belgium was essentially the land of low wages. After the war the standard of living of the working classes changed very greatly. The eight-hour day became the general rule, in spite of various legalized exceptions and modifications. Wages rose, owing to the power now possessed by the trade unions. Albert Thomas, director of the international labour office, stated in 1925 that Belgium was probably the country where working-class status had been most conspicuously raised since the war. The result of this is that the owners of industrial undertakings can no longer make up for inferior equipment by low wages; and this is one of the most important factors of the technical progress indicated by the facts and figures set out in this article. See the monthly *Bulletin* of the Belgian Chamber of Commerce, in London, continued as *The Anglo-Belge Trade Journal*. (E. VA)

HISTORY¹

Separation of the Northern and Southern Netherlands.

—The conclusion of the Union of Arras (Jan. 6, 1579) by the Catholic provinces of Artois and Hainaut enabled Alexander Farnese (*q.v.*) to resume the war against the Protestants of the Netherlands. William of Orange was supported by the Union of Utrecht (Jan. 29, 1579), which combined the northern provinces in their opposition to the king of Spain. William of Orange at first tried to set up the duke of Anjou, the brother of the king of France, in opposition to the king of Spain; but the assistance of the ambitious duke proved to be useless. He arrived in Antwerp early in 1582, and in the following year he attempted to gain possession of the city by force (Jan. 17, 1583). This act of treachery put an end to his pretensions, and promoted the success of Farnese. On Nov. 30, 1581, the latter had captured Tournai. After a series of sieges he made himself master of Ypres, Dunkirk, Bruges, Ghent, Brussels and finally Antwerp, which capitulated on Aug. 17, 1585, after a heroic resistance.

BELGIUM UNDER SPANISH RULE

From this time onwards the whole of the southern part of the Netherlands once more recognized Philip II. as its sovereign. The system set up by the peace of Arras (May 19, 1579) in all the reconquered provinces was not one of Spanish domination, but simply of dynastic union with Spain. The country recognized Philip II. as its legitimate sovereign, but retained its autonomy. The king was represented by a governor-general at Brussels. The council of State, the privy council and the council of finance

¹For earlier history see NETHERLANDS; FLANDERS; BRABANT; LIÈGE, etc.

which acted with him were, however, composed entirely of natives of the country. All the provinces were confirmed in their constitutions and privileges. The only departments in which the king had sole control were the command of the army and foreign policy. Taxes could not be levied without the consent of the provinces. This was the principal safeguard of national autonomy; Philip II. and his successors dared not withdraw it for fear of causing a fresh revolution.

Although the peace of Arras represented the capitulation of the king of Spain in the political sphere, it gave him complete victory on the religious question. In all the provinces which Farnese reconquered the Protestants were obliged either to become reconciled to the Catholic Church or to emigrate, and Belgium, or the Spanish Netherlands, as it was then called to distinguish it from the United Provinces, henceforth became an exclusively Catholic country.

The reconquest of Belgium by Farnese was intended to be merely the prelude to that of the 17 provinces of the Netherlands. The United Provinces were supported, however, by France and England, and under Maurice and Frederick Henry, the sons of William of Orange, they successfully repelled all the efforts of Philip II.'s generals. The destruction of the Spanish Armada in Aug. 1588 and the fact that Farnese was obliged to go to France to make war on Henry IV. gave them opportunities of which they were not slow to take advantage.

Albert and Isabella.—The able Farnese died, worn out, on Dec. 3, 1592, and was succeeded as governor by the Archduke Ernest, after whose death (Feb. 1595) Philip II. decided to try a new method: The government was entrusted to the Archduke Albert (Feb. 1596), and he was instructed to conclude peace with France (peace of Vervins, May 2, 1598) so as to have his hands free for the reconquest of the United Provinces. Hoping that the Provinces would be less recalcitrant to an independent sovereign than to the Spanish crown, the king married Albert to his daughter Isabella, and on May 6, 1598, handed over the whole of the Netherlands to the newly married couple as a sovereign State. Its independence was, however, more apparent than real, and the stipulation that Catholicism was to be the only religion tolerated destroyed any prospect of winning over the United Provinces, which clung more passionately than ever to their Calvinism.

The war therefore continued. Albert was an unskilful general, and was defeated at Nieuport by Maurice of Nassau. Ambrose Spinola then took charge of military operations, and this enabled Albert to obtain possession of Ostend in 1604; but no decisive success was achieved in the north. In 1609 Albert had to conclude a twelve years' truce with the United Provinces.

The archdukes made use of the twelve years' truce to consolidate their position in the Spanish Netherlands and to reorganize Catholicism in the country on a firm basis with the aid of the Jesuits, who from that time onwards exercised a predominant influence over the religious and intellectual life of the country. They impressed themselves upon it so strongly that the results may be traced even down to the present day. The reign of Albert and Isabella was the last period of brilliance which Belgian civilization enjoyed until the 19th century. It was at this time that the school of Rubens (1577–1640) flourished at Antwerp, Justus Lipsius enhanced the reputation of the University of Louvain, and the Jesuits, who produced a brilliant group of scholars in Belgium, began the monumental work of the *Acta Sanctorum* (q.v.; see also BOLLANDISTS).

As Albert and Isabella had no children, it was clear that after their death Belgium would revert to the king of Spain. Albert died in 1621, and Isabella henceforth acted merely as governor for Philip IV. On the expiry of the twelve years' truce, war was resumed, with unfortunate results for Spain. Frederick Henry of Nassau captured Bois-le-Duc (1629) and Maastricht on Aug. 22, 1632. A conspiracy formed by the nobility in the same year bore significant witness to the discontented state of the country.

The situation became still more critical when, a few months after the death of Isabella (Dec. 1, 1633), France concluded an alliance with the United Provinces. The new governor, Cardinal Infante Don Ferdinand, was at first successful in resisting the

double attack of the French and the Dutch. On Oct. 10, 1637, however, Frederick Henry entered Breda, and Arras surrendered to the king of France on Aug. 9, 1640. The Cardinal Infante's successor, Don Francisco de Melo, was beaten by the prince de Condé at Rocroi on May 19, 1643. In 1644 the Dutch obtained possession of Dalhem, Rolduc and Fauquemont, and in 1645 the capture of Hulst put them in complete possession of the left bank of the estuary of the Scheldt.

The Peace of Munster.—It was now clear that Spain could not continue to fight on two fronts. In order to have his hands free for the war with France, Philip IV. resigned himself to concluding peace finally with the United Provinces at Munster on Jan. 30, 1648. The independence of the United Provinces was at last recognized, and all the districts which they had conquered in Flanders, Brabant and Limburg were ceded to them. Philip IV. also granted their request for the perpetual closing of the Scheldt, thus sacrificing Antwerp to Amsterdam and the prosperity of Belgium to that of Holland.

Louis XIV.—Even this surrender to the rebel republic did not enable the king of Spain to wage war successfully on France. He suffered a series of defeats, alternating with treaties, each one of which represented a further cession of territory to the enemy. The Spanish governors who succeeded the Archduke Leopold (1647–1656): Don Juan, the son of Philip IV., the marquis of Caracena, the marquis of Castel Rodrigo, the grand commander of Castille, the count of Monterey, the duke of Villa Hermosa, Alexander Farnese, the marquis of Grana and the marquis of Gastanaga, did not receive from the exhausted Spanish monarchy sufficient money or troops to enable them to fight successfully against the king of France with his unexhausted resources. After the defeats of Lens (1648), and the Dunes (1658) the peace of the Pyrenees was concluded on Nov. 7, 1659. This treaty gave Louis XIV. the greater part of Artois and a number of fortresses along the southern frontier of Belgium. Under the Peace of Aix-la-Chapelle (May 2, 1668) he also received Charleroi, Binche, Ath, Douai, Tournai, Lille and Courtrai. Spain recovered Courtrai, Binche and Charleroi by the peace of Nijmegen (Aug. 10, 1678), but lost in exchange Valenciennes, Maubeuge, Cambrai, Saint-Omer, Poperinghe, Cassel, Bailleul and Ypres. The "*chambres de réunion*" created by Louis XIV. made further annexations even though the two countries were at peace. Some of the annexed districts were restored under the Peace of Ryswick (Sept. 20, 1697), when Louis XIV. was for the first time compelled to give way before the general European coalition against him.

Less than three years later, on Nov. 1, 1700, Charles II., the last remaining descendant of Philip II., died at Madrid without issue. In his will he left the whole of the Spanish monarchy, including the Catholic Netherlands, to Philip of Anjou, Louis XIV.'s grandson, who took the title of Philip V.

War of the Spanish Succession.—It was obvious that Louis XIV. would not fail to take the opportunity offered by Charles II.'s will to make himself master of Belgium. From the beginning of his reign he had been constantly endeavouring to make that country an outpost of France. England and the republic of the United Provinces were equally determined to prevent him from acquiring a position so likely to be dangerous to them. In Feb. 1701, Louis XIV. caused his grandson to hand over to him the government of the Netherlands, with the complicity of the governor, Maximilian Emmanuel of Bavaria. Thenceforward war was inevitable. William III., in his dual capacity as stadtholder of Holland and king of England, had a double reason to fear French expansion, and he was at once the initiator of the war and the one who carried it on most actively.

Marlborough's victory at Ramillies (May 23, 1706) compelled the French to evacuate Belgium, and all their efforts to return were unsuccessful. The country was provisionally administered by a "Conference" composed of English and Dutch until such time as Europe should have decided on its future. This was done by the Peace of Utrecht (April 11, 1713), when Belgium received as its sovereign the emperor Charles VI., the head of the Austrian branch of the House of Habsburg.

BELGIUM UNDER AUSTRIAN RULE

The change of dynasty did not involve any change in the political system established in 1579 by the Peace of Arras. Just as there had been no Spanish domination, there was now no Austrian domination. National autonomy was maintained; the traditional institutions were preserved; the provinces continued to vote their own taxes. The only connection between Belgium and Austria was that they had the same sovereign. The Austrian emperors were represented by a governor at Brussels, just as the kings of Spain had been. The emperor also appointed a "minister plenipotentiary" at Brussels, with whom his chancellery corresponded directly, to keep watch over the conduct of the governor.

The Barrier Treaty.—In order to prevent any further attempt at annexation on the part of France, England and the United Provinces required the emperor to sign the Barrier Treaty (Nov. 15, 1715). This treaty gave the United Provinces the right to maintain garrisons at Namur, Tournai, Menin, Furnes, Warneton, Ypres and Termonde. Belgium was thus for a second time sacrificed to its northern neighbour, for whose safety it was made a bulwark. The frontier between Belgium and France, now that Louis XIV had made restitution of the last towns he had taken (Tournai, Ypres, Dixmude, etc.), was drawn almost exactly as it stood in 1529.

The country, which had been the cockpit of Europe since the middle of the 17th century, was now exhausted. The population was profoundly discontented. Disturbances broke out at Brussels in 1717, under the administration of the marquis de Prié, minister plenipotentiary of the Governor Eugene of Savoy, who never established himself in Brussels and was governor only in name. The marquis de Prié earned the detestation of the people by ordering the execution of François Anneessens, who had tried to oppose the vote of the taxes by the Brussels municipality (1719). He was equally disliked by the nobility. The emperor recalled him in 1724, and the Archduchess Marie Elizabeth became governor.

The Ostend Company.—Peace having been restored, an attempt was made to improve the economic situation of the country. There was no hope of reviving the prosperity of the port of Antwerp, since the closing of the Scheldt had been ratified by the Treaty of Utrecht. Certain schemes which had been considered first in the time of Maximilian Emmanuel of Bavaria were, however, taken up once more. The proposal was to develop the maritime trade of Ostend and to connect it by means of canals with the Scheldt, the Meuse and the Rhine. On Dec. 19, 1722, the emperor Charles VI. founded an India company in Ostend with a capital of six million florins. England and the United Provinces were, however, alarmed at the prospect of a rival of this kind. It would have been necessary to go to war to make them agree to it, and as the emperor could not undertake this, he had to resign himself. On May 31, 1727, the Ostend company (*q.v.*) was sacrificed to "the welfare of Europe."

The Jansenist controversy, which during the past fifty years had raged with great bitterness, was a source of uneasiness to the Government. It was concluded under the governorship of Marie Elizabeth, who imposed the Bull *Unigenitus* as a rule for religion and for the State. This was a fresh victory for the Jesuits, who now ceased to have any opponents in the country.

Maria Theresa.—On the death of Charles VI., on Oct. 20, 1740, the Belgian provinces recognized Maria Theresa without opposition. The War of the Austrian Succession, however, soon spread to Belgium which, in 1744, was invaded by the French under Maurice de Saxe. The Dutch garrisons of the Barrier capitulated at once without attempting any resistance. The defeat of the English at Fontenoy on May 11, 1745 gave Louis XV. the possession of Belgium, for which Louis XIV. had striven in vain. He only occupied it as a pledge, however, and it was restored to Maria Theresa by the peace of Aix-la-Chapelle (Oct. 18, 1748).

Maria Theresa is the only foreign ruler of Belgium whose memory has remained in the affections of the nation. Her reign was a period of recovery for the country, and the population attributed the credit of this to her. As a matter of fact, Maria

Theresa cared nothing for the retention of the Netherlands, which she was constantly trying to exchange for Bavaria. She only kept her Belgian provinces because she could not do otherwise. At the same time, she tried to make the best possible use of them, and in her own interest she administered them in such a way as to be able to benefit by their resources.

The alliance which she concluded with France in 1757 secured a period of peace for Belgium which lasted 35 years. The time of rest thus provided after a century of almost incessant war was utilized to the best advantage. Private individuals and the authorities of the provinces worked together in restoring the prosperity of the country and developing industry and agriculture. Roads and canals were constructed; Flemish agriculture reached such a degree of prosperity that it was regarded as a model. The old linen and lace industries were revived. In Hainaut, coal-mining and the glass industry were actively developed. The population increased with the national wealth.

The Government assisted the efforts of the people judiciously. Maria Theresa entrusted the administration in 1744 to her brother-in-law Charles of Lorraine, who became extremely popular in the country. She provided him with able ministers plenipotentiary, who adjusted customs tariffs in such a way as to protect national industries, established depots to facilitate transport, and introduced new industries.

Other reforms were introduced in order to rouse the population from the intellectual apathy into which it had fallen since the middle of the 17th century as an inevitable consequence of the misfortunes of the country. An Academy, which still exists, was founded at Brussels in 1772. When the Society of Jesus was suppressed in 1773, the Government was able to set up "Royal Colleges" in several of the towns. These were the first lay educational establishments to be created in Belgium.

Maria Theresa's innovations were inspired by the doctrine of "enlightened despotism" which the majority of European states, following the example of Prussia, were adopting as a feature of their policy. She obtained acceptance for them because of the benefits conferred by her government, and because of the skill with which she managed to avoid offending the conservatism of her Belgian subjects. Her successor Joseph II. (1780-90) acted in an entirely different manner.

Joseph II.—Joseph II. was sincerely anxious to promote the public welfare, but he was full of self-conceit, and firmly believed that progress must be imposed from above. He made up his mind to recast the institutions of Belgium according to the principles of rational and centralized absolutism. Before he succeeded his mother he had made a hurried tour through the country and had come back full of contempt for the antiquated state of affairs which he found there. His first object was to obtain the abolition of the stipulations imposed on Belgium by the Munster and the Barrier treaties, which he regarded as equally incompatible with the principles of equity and with his sovereign rights. Maria Theresa had already refused to pay the sums due for the upkeep of the Dutch garrisons. In 1781 Joseph informed the States-General of the United Provinces that he had decided to dismantle the Belgian fortresses, and that they should therefore recall their troops. They accepted the situation so readily that he thought he would also be able to reopen the Scheldt. Much to his surprise, the Dutch fired on the vessels which he had ordered to sail up and down the river. The outbreak of war was prevented by French intervention, and the Treaty of Fontainebleau (Nov. 8, 1785) confirmed the *status quo*.

Joseph II. might have won popularity by the above actions, but the internal reforms which he introduced aroused both religious and political opposition. His first measures were aimed at the Church. The Edict of Tolerance (Oct. 1781), which recognized religious freedom in Belgium for the first time since the peace of Arras, deeply offended the clergy and the Catholic sentiments of the population. The suppression of the "unnecessary" convents (1783), of the religious confraternities, and of pilgrimages, the closing of the episcopal seminaries and their replacement by two seminaries founded by the State at Louvain and Luxembourg (1786) aroused intensely bitter feeling.

Still greater hostility was aroused by Joseph II.'s attempt to modify the traditional institutions of the country. He refused to listen to the counsels of prudence given him by his sister Marie Christine, the governor, and by the ministers plenipotentiary; and insisted on introducing innovations which, although in accordance with the spirit of the age, were most objectionable to Belgian conservatism: abolition of the gilds, abolition of torture, reorganization of the administration of the finances and of public works, and free trade in corn. Finally, in 1787, the whole administration was remodelled. The country was divided into nine districts (*cercles*) with "intendants" at their head, attached to a council of Government meeting at Brussels. Justice was to be administered by two supreme councils at Brussels and Luxembourg, and by 63 courts of first instance.

Thus, by nothing less than a *coup d'état*, the traditional autonomy of the Belgian provinces, which had been respected by all their rulers from Philip II. onwards, was destroyed and replaced by a centralized system working by the emperor's orders. Even men of advanced opinions, who realized that the constitution stood in need of improvement, were as angry as those of conservative views at seeing the emperor dispose of their country without consulting them. A formidable movement of opposition broke out in all the provinces. Marie Christine, the Governor, dared not enforce the edicts. The emperor however persisted. He sent a new minister plenipotentiary, the count of Trauttmansdorff, to Brussels, and entrusted the command of the troops to Gen d'Alton, who had orders to enforce the reforms and repress disturbances.

The Brabant Revolt.—If the emperor was obstinate, the country was equally so. The States of Hainault and Brabant refused to pay taxes. The infraction of the privilege of the *Joyeuse Entrée* (*q.v.*) brought popular exasperation to a head. The events then taking place in France, and especially the news of the taking of the Bastille, encouraged the inhabitants of Belgium in their resistance. The conservatives, whose leader was the lawyer van der Noot, combined with the partisans of national reform, the chief of whom was another lawyer, Vonck. They fled to Holland, where they formed a corps of volunteers. On Oct. 24, 1789, under the leadership of Col van der Mersch, they invaded Campine, and contrary to all expectation defeated the Austrian troops at Turnhout. This was the signal for a general rising. The garrison of Ghent capitulated on Nov. 16, and that of Maastricht on Nov. 21. Brussels rose in revolt on Dec. 10. Two days later the Government and the troops hurriedly evacuated the city. All Belgium, with the exception of Luxembourg, where the army was concentrated, was in a state of revolt.

The various parties were, however, very far from unanimity in their political views. The various provinces constituted themselves into the Belgian United States on Jan. 11, 1790, and entrusted executive power to a sovereign congress. Two opposing parties at once appeared in the congress. The democrats or Vonckists wished to adopt a constitution based on the principles laid down by the French National Assembly; the aristocrats or van der Nootists simply desired to restore the position which had previously existed. The latter were supported by the clergy and by the majority of the public. Riots broke out; Vonck's partisans were terrorized, and left the field clear for their opponents. Van der Noot, who hoped to obtain the support of the United Provinces and of Prussia, was quite unable to control events. The Belgian republic, torn by internal disputes, soon fell into a state of anarchy and was unable to prepare its resistance.

Joseph II. died on Feb. 20, 1790, and was succeeded by Leopold II. Leopold first attempted to win over the Belgians by conciliatory means, but his proposals were rejected. After his reconciliation with the king of Prussia at the Convention of Reichenbach (July 27, 1790) he had recourse to arms. The Belgian army was driven back without difficulty, and on Dec. 2 the Austrian troops under Gen. Bender entered Brussels. A few days later the subjection of the country was complete. The revolution inaccurately known in history as the Brabant Revolt was at an end.

Leopold, who did not wish to provoke further disturbances,

made no attempt to reintroduce Joseph's reforms. Government was restored in the form in which it had existed under Maria Theresa. In spite of this, the restoration continued to be exceedingly unpopular. The course which the French revolution was taking revived the hope of Belgian independence. Thus, when war broke out between France and Austria, and Dumouriez won the battle of Jemappes (Nov. 6, 1792) and occupied Belgium, his victory was at first welcomed by the population. Dumouriez would have liked to make Belgium into a republic and to make use of it to further his plans for a restoration of the monarchy in France. He relied on the Vonckists for support, and by doing so at once excited the hostility of the conservatives. The French convention, however, thwarted his plans, and was obviously preparing the way for the annexation of the country. The enthusiasm with which he had at first been greeted soon gave place to un concealed dislike. When the Austrians resumed the offensive, and defeated Dumouriez at Neerwinden (March 18, 1793) and once more took possession of Belgium, the Belgians resigned themselves without difficulty.

ANNEXATION OF BELGIUM BY FRANCE

The restored regime was of short duration. Jourdan's victory at Fleurus (June 26, 1794) resulted in a fresh conquest of the Netherlands by France. The rule of the Austrian sovereigns was abolished in fact, and the position received legal sanction by the treaties of Campo Formio (1797) and Lunéville (1801), under which Francis II recognized the annexation of Belgium by the French republic.

The battle of Fleurus enabled France to accomplish what Louis XIV. had planned. After a period of occupation and military rule, the Convention on Oct. 1, 1795, voted the annexation of Belgium and the principality of Liège (*q.v.*) which was thenceforth amalgamated with it.

France accomplished, but in a far more radical manner, what had been attempted by Joseph II. A modern State was built up on the ruins of the past. All branches of the administration were centralized and systematized. All privileges were abolished. The Church, which had formerly been so powerful and so deeply respected, was persecuted. It is not surprising that the Belgians detested the new regime. Their hostility was the greater for the terrible economic crisis which accompanied the change of rule. The introduction of military conscription led in Oct. 1798 to a revolt of the peasants in the Flemish districts of the country which was repressed without mercy.

Napoleon's *coup d'état* in Nov. 1799 was the starting point of a new era. Under the consulate and the empire Belgium became accustomed to the new system which was introduced, and which still constitutes the basis of its administration. The country was divided into nine departments, each under a prefect. Courts of first instance and courts of appeal were created, and had to administer the French code of laws. A metric system of weights and measures and currency was introduced. The clergy were reconciled with the Government by the *Concordat*. With the vast markets of the empire now open to Belgian industry a period of unprecedented activity succeeded. The manufacture of cotton and beet sugar was introduced and made rapid progress.

The Napoleonic regime nevertheless remained unpopular. The complete lack of political liberty, the exigencies of conscription and the abuses of the Continental System (*q.v.*) led to a spirit of disaffection which, by the time of the fall of the empire, had become general. The occupation of Belgium by the allies in 1814 was hailed with relief.

THE KINGDOM OF THE NETHERLANDS

The Powers were determined not to leave France in possession of Belgium. It could not be given back to the Austrian emperor, who in any case did not desire it. Under the influence of England it was decided to unite it in a single State with the old Republic of the United Provinces, and thus to constitute a new barrier better capable of resisting future French expansion than that of 1715. The Kingdom of the Netherlands, the existence of which was confirmed by the Treaty of Vienna (June 1815), was thus established for the convenience of Europe, regardless of the

wishes of the Belgians and the Dutch who would have to live side by side in one country. Prince William of Orange ascended the throne on March 16, 1815, under the title of William I.

William I.—The new ruler was faced with the task of assimilating two peoples which for the last 200 years had had strikingly contrasted customs, economic interests, ideas and above all religions, the one being Catholic and the other Protestant. The Fundamental Law (*Grondwet*) of the new kingdom gave the Belgians and Dutch an equal number of representatives in the States-General, although the population of Belgium was three and a half millions and that of Holland only two millions. It also recognized religious liberty, and this was obnoxious to the Catholic Church. Finally, it gave extremely wide powers to the king, who was Dutch and Protestant. All these provisions were offensive to the Belgians. The king laid the Constitution before the "notables" for adoption; they rejected it, but it was nevertheless promulgated. During the first few years, however, the situation appeared to be not unsatisfactory. Belgium began to assume the industrial character which has distinguished it ever since. Antwerp once more became an important port. The cotton spinning industry at Ghent, the manufacture of linen at Verviers, and the coal-mining industry in the Liège and Hainault districts attained even greater prosperity than during the French occupation. The Dutch colonies provided new markets for export.

The king also endeavoured to promote education, which, with the support of the opponents of the old régime, who were apprehensive of the influence of the Church, he organized under the auspices of the State. Universities were founded at Ghent, Liège and Louvain; "*Athénées*" were created; the independent, *i.e.*, ecclesiastical, schools were subjected to inspection. On June 14, 1825, a "Philosophical College" was set up at Louvain, and seminarists were required to attend it. These measures revived the hostility of the clergy. The substitution of Dutch for French as the official language irritated the middle classes, which had been affected by French influence. Finally, there grew up a liberal party which attacked the king's prerogatives in the name of parliamentarianism.

William, who was naturally obstinate, persisted in his plans. The opposition journals were prosecuted, but this only increased the strength of the movement. It became irresistible when, in 1828, the Liberals and the Catholics, who up till then had opposed one another, concluded the "union of parties." A general petition for the redress of grievances was organized, and by Nov. 1829 had obtained over 300,000 signatures. The king's refusal to yield was bound to lead to a revolution. All foreign observers were united in expecting such a development as early as 1829. The Paris revolution of July 1830 was thus not the cause of that which broke out in Brussels a few weeks later; but it fired the train.

The Belgian Revolution.—The disturbances broke out on Aug. 25, after a performance of *La Muette*, an opera abounding in appeals to liberty. The authorities were taken by surprise and lost their heads; the troops retired, without resistance, on the royal palace. On the following day a citizens' guard was organized under the command of Emmanuel d'Hoogvorst, and took over the duties of the lawful authorities. Disturbances at once broke out in the provinces in sympathy with those in the capital, and the red, yellow and black flag which had been the sign of the Brabançon Revolt began to be shown. No one, however, yet contemplated the overthrow of the dynasty. All that was demanded was the administrative separation of Belgium and Holland.

The king failed to realize the importance of the movement, and still thought that it could be suppressed. He hurriedly sent his sons to Brussels at the head of a small body of troops. They found the town prepared for resistance, and as they did not dare to risk a fight, the prince of Orange, the heir to the throne, consented to parley with the rebels. He was unsuccessful, and on Sept. 3 he left Brussels, taking the garrison with him.

While the king was summoning the States-General at The Hague, volunteers were flocking into Brussels. Charles Rogier (*q.v.*) arrived at the head of a troop of Liégeois. French republicans came to foment the revolt. All regularly constituted author-

ity was abolished. William, who hoped to obtain the support of the moderates, sent his second son, Prince Frederick, to occupy the town. His troops entered Brussels on Sept. 23, but were received by the population with a fusillade which checked their advance. After three days' fighting they retreated, and the volunteers and the citizens' guard, whose numbers were swollen by contingents from all parts of the country, victoriously pursued them to Antwerp.

The Provisional Government.—On the evening of Sept. 23 there had been constituted an "administrative committee" which took the title of provisional Government. It included Rogier, d'Hoogvorst, Joly, F. de Mérode, Gendebien, Van de Weyer, and after the 28th, L. de Potter. This revolutionary Government took no further notice of the States-General, which on the 29th voted in favour of the separation of the two parts of the kingdom. It also refused to negotiate with the prince of Orange, whom the king had sent to Antwerp, and who, exceeding his instructions, went so far as to recognize the Belgians as an "independent nation." On Oct. 4, the provisional Government had itself proclaimed national independence, paying no attention either to the king or to the Powers which had set up the kingdom of the Netherlands. The revolt was thus not merely against William, but also against Europe. On the same day as it proclaimed national independence, the provisional Government summoned a congress to draw up the constitution of the country. The congress met on Nov. 10.

In the meantime, the Belgians had captured Antwerp. Gen. Chassé maintained his position in the citadel, and bombarded the town from there. The only result was to exacerbate the hatred felt for the king and the dynasty. On Nov. 24 the congress voted the perpetual exclusion of the house of Orange from the throne of Belgium.

The London Conference.—William had already appealed to the Powers to intervene, and in November, at the proposal of Great Britain, a conference of ambassadors was called in London. The main object was to avert a European war, which would have been the inevitable consequence if France had intervened in Belgium. Under the influence of France and Great Britain, Russia (which was paralysed by the Polish rising), Prussia and Austria consented to give up the principle of legitimacy. On Dec. 20, the conference imposed an armistice on William and the Belgians, invited the provisional Government to send a deputation, and declared the dissolution of the Kingdom of the Netherlands. A month later, on Jan. 20, 1831, it decided that Belgium should be an independent and perpetually neutral State, not guaranteed by the Powers.

BELGIUM INDEPENDENT

The Powers wished the congress to give the crown to the prince of Orange, but instead of doing so it elected the duke of Nemours, the son of Louis Philippe (Feb. 3, 1831). For the sake of preserving peace, the king of France refused his consent. The congress then set up a regency. The office of regent was entrusted to the president of the congress, Surlet de Chokier. There ensued a period of anarchy, and France tried to take advantage of it to bring about the partition of Belgium between itself and Holland. Lord Palmerston took a firm stand in favour of the decisions which had been adopted. The election of Prince Leopold of Saxe-Coburg as king put an end to the crisis. The conference drew up a treaty of Eighteen Articles (June 26, 1831) regulating the separation between Belgium and Holland. It was accepted by the congress, and on July 21 Leopold, who had made his consent conditional on the acceptance of the treaty, arrived in Brussels and took the oath of allegiance to the constitution.

The Treaty of Twenty-four Articles.—Some days later, William invaded Belgium (Aug. 2, 1831). His troops easily defeated the Belgians, who had not been able to organize an army. Leopold appealed to France, and with the consent of the conference, Louis Philippe sent Marshal Gérard to restore the position. The Dutch retreated before him without an action.

The conference then replaced the treaty of Eighteen Articles by a much less favourable treaty of Twenty-four Articles (Oct.

14, 1831). Leopold accepted it, but William protested against the forcible measures used against him, and refused to sign the treaty. His resistance was not broken down even when France and Great Britain blockaded the Dutch ports and when the citadel of Antwerp was bombarded by the French, who captured it on Dec. 23. On May 21, 1833, however, William agreed to conclude a provisional convention with Palmerston and Talleyrand for the maintenance of the *status quo*. This was all in favour of the Belgians, who not only continued to occupy Limburg and Luxemburg, which they would have had to hand back under the Twenty-four Articles, but contributed nothing to the debt of the kingdom of the Netherlands, for which Holland remained exclusively responsible.

William was thus obliged to accept the Twenty-four Articles on March 14, 1838. Belgium attempted to obtain their revision, but only received certain financial concessions. Parliament decided to accept the provisions which constitute the treaties of April 19, 1839. Peace was thus restored between Holland and Belgium, and Holland recognized the new kingdom. Part of Luxemburg was allotted to Belgium, and the rest became a Grand Duchy which was a member of the German confederation under the sovereignty of William. Limburg and Maestricht remained in the possession of Holland. In return, Belgium was recognized as an "independent and perpetually neutral State" under the guarantee of the Powers.

The Belgian Constitution.—The Belgian constitution adopted by the congress on Feb. 7, 1831, to which Leopold had taken the oath of allegiance on his accession, was the most liberal in Europe. It established a strictly parliamentary monarchy based on the principle of national sovereignty. The rights of the subject were more far-reaching than in any other country except England. Under the influence of the reaction against William's absolutism, the executive powers allotted to the king were reduced to the minimum.

Leopold I.—During the first years of Leopold I's reign, the general impression was that the new kingdom could not last. The revolution had resulted in a terrible economic crisis, and the discontented manufacturers formed a small but exceedingly energetic Orangist party which was encouraged by the king of Holland. It was thought that the constitution would make it impossible for the king to govern. Thanks, however, to Leopold's wisdom and devotion, and thanks also to the energy of the nation, all the difficulties were overcome. In order to give the country fresh markets, an act was passed in 1834 for the construction of railways. These were some of the first railways to be built on the Continent. Laws regulating the administration of the provinces and the municipalities were passed in 1836. The army was established on a sound basis. After 1839 the Orangist agitation declined and soon died away altogether.

Up to this point the Catholic and Liberal Parties, whose joint action had made the success of the revolution possible, had worked together in parliament. They began to diverge soon after the existence of the State had been guaranteed by the treaties of 1839. The system of coalition ministries was gradually replaced by that of ministries representing the party which had a majority in the chambers. After the disturbances of 1856 which led to the resignation of the Catholic ministry of de Decker and brought Rogier's Liberal ministry into power, the new system was regularly applied.

The Crisis of 1848.—The king guided the foreign policy of the country firmly in the spirit of neutrality required by the international undertakings which it had assumed. He gave proof of this in the crisis of 1848. Thanks to the liberal character of its institutions and to the electoral reform measure unanimously adopted by the chambers, Belgium, alone among the countries of the Continent, escaped the disturbances which then prevailed throughout Europe. From that time onwards its political system was regarded as a model. The Belgian constitution was imitated more or less exactly by all the Continental countries which adopted the Parliamentary régime in the 19th century.

The fall of Louis Philippe, whose daughter, Louise Marie, Leopold had married on Aug. 9, 1832, and subsequently the *coup d'état* of 1852 by which Napoleon III. became emperor of the

French, placed Belgium in a difficult position. The freedom of the press which prevailed in Belgium made it possible for French refugees in that country to carry on republican propaganda against Napoleon III., and this gave rise to unpleasant incidents which gave some show of justification for the annexation schemes which the emperor was thought to cherish. As early as 1853 the king made efforts to induce parliament to grant funds by means of which Antwerp was surrounded with a ring of forts to serve as a stronghold for the army in case of war.

Admirable measures were taken to assist the economic development of the country. After 1849 a policy of free trade was gradually substituted for protectionism. A national bank was founded in 1850; the local *octrois* (dues on foodstuffs brought into towns) were abolished in 1860; in 1863 the dues payable by ships sailing up the Scheldt to Antwerp were redeemed. Between 1861 and 1863, commercial treaties were concluded with a large number of countries.

Leopold II.—The grief displayed by the nation at the death of Leopold I. (Dec. 10 1865), and the loyalty with which the accession of Leopold II. was welcomed, proved that the new régime was firmly established. The international situation was critical. Napoleon III. was anxious to seek compensation for the triumph of Prussia at Sadowa. The tone of the Paris press towards Belgium was threatening. The attempts which the emperor made in 1867 to acquire the Grand Duchy of Luxemburg were a disquieting symptom, in spite of their failure. In the following year the French railway company of the *Est* negotiated for the purchase of the railways of the province of Luxemburg. The Chambers on Feb. 23, 1869, adopted emergency legislation prohibiting the sale of the railways, and a rupture was only averted by the energy and skill with which negotiations were conducted by the minister Frère-Orban, who was supported by the British cabinet. The war of 1870 provided fresh proof of the Government's determination to preserve neutrality. The army was mobilized and sent to the frontier with orders to repulse any troops which attempted to cross it. The victory of Prussia completely altered the position of Belgium. The increased strength of Germany on the one hand and the possibility of a French *revanche* on the other greatly complicated its duties as a neutral State. In order to provide for future eventualities, the king induced parliament in 1887 to grant credits for the fortification of the positions of Liège and Namur on the Meuse.

Revision of the Constitution.—In the meantime the conflict of parties was growing more acute. The Education Act adopted in 1879 under the Frère-Orban cabinet met with strong resistance from the Catholics. The Government broke off diplomatic relations with the pope. The Liberal Party, however, was weakened by the dissension in its ranks between the moderate or "doctrinaire" elements and the "progressives"; and it was defeated at the 1884 elections. From that time onwards there was always a Catholic ministry in power until 1914.

At this time the working classes did not have the right to vote, and the long-standing discontent to which this gave rise facilitated the spread of socialist opinions amongst them. In March 1886 there was a riot at Liège which was followed by very serious outbreaks in all the industrial districts. They were repressed with much bloodshed. The Beernaert ministry ordered an enquiry into the position of the workers, and it was found that social reforms were long overdue and must be undertaken without delay. From 1889 onwards a series of laws were adopted on workers' housing, the employment of women and children, factory inspection, workmen's compensation for accidents, and so on.

The constitution restricted the suffrage to a minority of the nation, and its extension was demanded with increasing vigour by the progressives and socialists. In 1890 the chambers voted in favour of the principle of the revision of the constitution. The delays which occurred in carrying out the revision gave rise to dangerous agitation, but the revised constitution at last received the royal assent in Sept. 1893. Universal suffrage was established, but the system was tempered by plural voting, which gave more than one vote to electors fulfilling certain conditions as regards income, age, education and family. The reform of the electoral

system was completed by the adoption of proportional representation in 1899.

The Flemish Question.—The progress of democracy gave increasing scope to the Flemish movement. Although freedom to use either language is one of the principles of the Belgian constitution, French alone was used for legislative and administrative purposes in the years which followed the revolution. French was as a matter of fact the language of the enfranchised middle classes both in the Flemish and the Walloon provinces. Between 1840 and 1850, however, there began to be protests against a state of affairs which placed the Flemish language in a position of inferiority and was injurious to the rights of those who used it. In 1856 the Government set up a commission to study the question of linguistic grievances. It was, however, some time before parliament began to adopt a series of laws intended to redress those grievances. The Government set up a Flemish Academy in 1886. In 1898 an act was adopted establishing the equality of the two national languages; laws were thenceforward adopted both in French and in Flemish. In 1912 a private bill proposing to transform the University of Ghent into a Flemish university was laid before parliament. In 1914 it was laid down that in the Flemish-speaking districts of the country, elementary education must be given in Flemish. The *flamingants* did not form themselves into a separate party, and it should be noted that their demands were not directed against their Walloon compatriots, towards whom they felt no national hostility. They simply desired that the State should give the Flemish-speaking Belgian the same treatment as the French-speaking Belgian, and that not merely in law but in fact. The French language nevertheless continued to spread. In 1910 there were in Belgium 2,833,334 persons speaking French only, 3,220,662 Flemish only, and 871,288 bilingual.

The system of military service based on selection by lot, with the possibility of providing a substitute, meant that in practice the well-to-do classes were exempt. This constituted a social injustice and a danger to which the king for a long time drew attention without success. The revision of the constitution strengthened the position of the partisans of personal service, and that system was adopted in Dec. 1909. A few days later, on Dec. 17, Leopold II. died at Laeken after a reign of 43 years.

The Congo.—From the beginning of his reign, Leopold endeavoured to develop the colonial policy of Belgium. His personal interest in the exploration and commercial development of the equatorial regions of Africa led, in the creation of the Congo Free State, to results which had originally not been anticipated. The *Comité des Études du Haut Congo*, formed in 1878 at the instance of the king and mainly financed by him, had developed into the International Association of the Congo, of which a Belgian officer, Col. M. Strauch, was president. Through the efforts in Africa of H. M. Stanley a rudimentary State was created, and through the efforts of King Leopold in Europe the International Association was recognized during 1884-85 by the Powers as an independent State. Declarations to this effect were exchanged between the Belgian Government and the association on Feb. 23, 1885. In April of the same year the Belgian chambers authorized the king to be the chief of the State founded by the association, which had already taken the name of *État Indépendant du Congo*. The union between Belgium and the new State was declared to be purely personal, but its European headquarters were in Brussels, its officials, in the course of time, became almost exclusively Belgian, and financially and commercially the connection between the two countries became increasingly close. In 1889, King Leopold announced that he had by his will bequeathed the Congo State to Belgium, and in 1890 the Belgian Government, in return for financial help, acquired the right of annexing the country under certain conditions. It was not until terrible reports of misgovernment created a strong agitation for reform in Great Britain, America and other countries responsible for having aided in the creation of the State, that public opinion in Belgium seriously concerned itself with the subject. The bill for annexation was finally passed in Sept. 1908. The full story of the Congo enterprise will be found under AFRICA, CONGO FREE STATE and BELGIAN CONGO.

Albert I.—As Leopold II. had no son, the crown passed to his nephew Albert, who had married princess Elizabeth of Bavaria on Oct. 2, 1900. He took the oath of allegiance to the constitution on Dec. 23, 1909. The early days of his reign were marked by a violent agitation by the Socialist Party in favour of universal suffrage without qualification. There was a general strike in 1913, but no disturbances took place.

In the same year the anxiety to which the international situation gave rise led the Broqueville ministry to pass a measure for the general reorganization of the army on the basis of universal military service, the reform to be completed in five years.

THE WAR PERIOD, 1914-18

The international crisis which came to a head in July 1914 found Belgium unprepared for war, in spite of her recent military laws. The neutrality of Belgium and Luxemburg had been guaranteed by the five Great Powers (Great Britain, France, Prussia, Russia and Austria) in the treaties of 1839, which bound the guaranteeing Powers to intervene if either party to a war violated that neutrality. On July 30, following the precedent in 1870, Sir Edward (Viscount) Grey addressed a message to the French and German Governments, drawing their attention to this point and asking for an assurance that Belgian neutrality would be respected. The German Government declared itself unable to answer this question; and on Aug. 2 invaded Luxemburg and sent Belgium an ultimatum calling on her to allow the German troops free passage across Belgian territory. If the request was refused, Germany would treat Belgium as an enemy. To this note Belgium, which had mobilized 15 classes of militia on July 31, replied by a formal refusal on Aug. 3. Parliament accepted war unanimously, and the Socialist Party assured the Government of its unreserved support. The leaders of the Liberal and Socialist Parties, MM. Goblet d'Aviella and Hymans and M. Vandervelde, joined the Government as ministers without portfolio.

The German Invasion and Occupation.—In the night of Aug. 3-4 the German army invaded the country. Liège fell on Aug. 7 and Namur on Aug. 23. It is estimated that in the province of Namur 1,949 civilians were killed and 3,000 houses destroyed. After their entry into Louvain the Germans set fire to the centre of the city, when the cathedral of St. Pierre, the famous library and 1,120 houses were destroyed. Seventy-nine of the inhabitants were shot. The town of Aerschot was almost destroyed. The Germans entered Brussels on Aug. 20. In the course of the occupation of Brabant 594 inhabitants were shot and in the Antwerp and Hainaut provinces 665 persons. Antwerp was evacuated by the Belgians on Oct. 6, and with the withdrawal of the Belgian army to the Yser under the direction of King Albert, the whole country, with the exception of the south-western districts of Flanders, was under German occupation. (See WORLD WAR.)

Germany sent Gen. von der Goltz, Baron von Bissing, and Gen. von Falkenhausen as successive governors-general. The governor-general, assisted by a central staff, exercised executive power. He legislated by promulgation of orders, except in the two Flanders, Hainaut and South Luxembourg, where all power rested with the highest local military authorities. Provinces and districts were administered by German officials, with military commandants of arrondissements. The powers of the Belgian provincial councils were finally suppressed on July 6, 1918. Many Belgian burgo-masters were deported. The occupied territories paid a tribute, amounting finally to 60,000,000 fr. per month, for the maintenance of the German army in Belgium. The legislative measures instituted by the German military tribunals were numerous and repressive. Von Bissing also instituted, Feb. 5, 1915, a new judicial system, with two courts of instance, that of the provincial governors and of the heads of arrondissements and of commandants. The executive and judicial powers were not separated. On April 3, 1917, the governors were empowered to pronounce total or partial confiscation of property. The Belgian judicial powers were suppressed by a decree of April 7, 1918. German *Kaiserliche Bezirksgerichte* replaced the Belgian *tribunaux répressifs*. The family was pronounced responsible for faults committed by a single

member of it. A sentence pronounced on an absentee could be served by a third person; general confiscation of all property, forbidden by the Hague Convention and the Belgian constitution, was introduced, as was deportation for refusal to work for the German authorities, or even for simple "undesirability." On April 7, 1918, German tribunals of first instance and appeal (in Brussels and Namur) replaced all civil Belgian jurisdiction. The Belgian magistrates, bench of judges and court of appeal made frequent protests. Three presidents of the last-named were deported in 1918 in consequence of a conflict arising out of the arrest of certain "activist" leaders.

In order to disorganize the country, Germany sought to exploit the linguistic differences between Belgium's northern and southern provinces with the help of the so-called *parti activiste*. The "activists" consisted of a small minority of persons who expected Germany to be victorious. The Flemish party energetically disavowed them; and to the last the nation maintained its anti-German attitude, encouraged by exhortations of Cardinal Mercier (d. Jan. 1926). From 1916 on, various decrees abolished the French language in the previous bilingual administration of Flanders. On March 21, 1917, a decree was issued dividing Belgium into two distinct linguistic regions, with administrative centres at Brussels and Namur. All ministries were doubled, the Flemish remaining in Brussels, the Walloon moving to Namur. French became the only official language in the Walloon district, Flemish in the west. The use of German and Flemish was, however, authorized in Walloon territory. The *activistes* attempted to organize a new independent Flemish State under German protection. On Feb. 11, 1918, an enormous demonstration was held in Brussels against separation. German troops dispersed the crowds, but, in face of the unanimous protests of the Belgian authorities, Germany did not dare recognize a legislative authority for the *Raad van Vlaanderen*. With ceaseless energy, however, she continued her efforts to foster linguistic differences, notably by flemicizing the University of Ghent (1916).

Industrial Distress.—Industry suffered severely from the occupation. Raw materials were requisitioned, foreign enterprises put under sequester on Feb. 17, 1915, together with all industrial concerns which might be useful or dangerous to Germany, especially great metallurgical businesses, quarries, mines, electricity works, etc. In 1915 central offices were set up for the coal, oil and grease, water, gas and electrical industries.

The stoppage of overseas exports ruined Belgian industry. Unemployment increased enormously, reaching 650,000 in 1916. Germany desired to recruit these workmen for her own use, but met with obstinate refusals. On Aug. 14 and 15, 1915, the first decrees appeared ordering severe penalties for persons who refused to work for Germany. At the same time, commissions were sent from Germany to take out of the Belgian workshops everything which could be used beyond the Rhine, and to destroy systematically all machinery which could not be transported to Germany. By June 30, 1918, 167 factories had been completely destroyed, and 161 were on a list of the governor-general's for immediate destruction. Of the 57 blast furnaces, 26 had been razed to the ground, 20 put completely out of action. Only the mines necessary for Germany were spared.

On Feb. 18 and July 21, 1917, work was forbidden in all factories and workshops except by special permission. At this moment Germany ordered the stoppage of all public works undertaken by the provinces and communes for the relief of unemployment. These steps were preliminary to the plan of deporting the Belgian working population. In November the military authorities requisitioned able-bodied men between the ages of 17 and 60 throughout the whole country. Inhabitants on the lines of communication were mostly sent to the Yser or North French fronts, to construct railways, prepare routes and dig trenches, often within the range of artillery. The other workmen were concentrated in great camps in Germany, whence they were dispatched to German factories or labour battalions; 57,718 were transported to Germany, 57,541 to the front; 2,531 died in consequence of ill-treatment.

Foodstuffs began to grow short in Nov. 1914. Immediately

on occupation, the German Government had repealed all measures taken by the Belgian Government to ensure rationing. Public authority had now no further power to intervene, and private initiative stepped in. Committees sprang up everywhere. A central committee was founded at Brussels under the title, *Comité Central de Secours et d'Alimentation*, under Ernest Solvay. The committee desired to import foodstuffs from England, but the British Government refused. Finally, von der Goltz having promised to exempt all imported foodstuffs from requisitioning, the British Government consented to allow their import under supervision of the embassies of Spain and the United States. The "Commission for Relief in Belgium" was set up to organize the supervision. The activity of the Comité Central acquired enormous importance, and extended throughout the country. It then changed its name to *Comité National de Secours et d'Alimentation*. By Dec. 31, 1918, it had distributed foodstuffs to provincial committees to the value of over 3½ milliard francs (2½ milliards for Belgium, 1 milliard for France). The profit made on the sale of foodstuffs was used to organize charitable works at an expenditure of 1,300,000 francs. After America's entry into the war H. C. Hoover resigned his post as president of the commission for relief, and a Spanish-Dutch committee took over the work.

The Belgian Government.—The German occupation forced the Government to retire, first to Antwerp, then to Ostend, then to Havre. At the same time, over 1,000,000 Belgians left the country, 200,000 fleeing to France, 100,000 to England and 700,000 to Holland. The Government in Havre immediately set about reorganizing the army, which had never left the front. On March 1, 1915, the Government called to the colours all Belgians from 18 to 25; numerous volunteers joined the forces; and the Government was able to maintain an army in the field with a mean effective strength of 150,000.

PEACE AND RECONSTRUCTION

Belgium was represented by Hymans, Vandervelde and Van den Heuvel at the Peace Conference, but was not admitted to the deliberations of the Council of Ten. At the second plenary session of the Peace Conference the Belgian, Canadian and certain other delegates protested against the control assumed by the "Big Five"; and from that time more scope was given to the representatives of nations other than the principal allied and associated Powers. Hymans played an important part in drafting the Covenant and Vandervelde in framing the constitution of the International Labour Office. By the Treaty of Versailles Belgian neutrality was abolished. Germany renounced in her favour her rights over Moresnet and the Walloon cantons of Eupen and Malmédy (*q v*). Belgium was confirmed in the possession of these two cantons by the League of Nations. The Grand Duchy of Luxemburg, on July 25, 1921, entered into a customs, railway and consular union with Belgium. In Africa, Belgium received the mandate for the Urundi and the Ruanda, representing part of the territories conquered by the Belgian army, which was operating with the forces of the British empire during the war. (*See RUANDA-URUNDI*)

After the war the problem of Belgium's international status took on a new form. Belgium was anxious to free herself of the restrictions on her right as a sovereign state to form defensive alliances, especially as the guarantee of neutrality which had been substituted for this right had proved ineffectual. The Treaties of Versailles, Saint-Germain and Neuilly accordingly contained the provision that Germany, Austria and Hungary recognized that the treaties of 1839 no longer conformed to the requirements of the situation, consented to their abrogation and accepted in advance whatever arrangements might be made to replace these treaties by the principal allied and associated Powers, or by any of them in concert with the Governments of Belgium and of the Netherlands.

The logical consequence of the new position was a military convention concluded in Aug. 1920 between Belgium and France, after full consultation between the respective general staffs. In Nov. 1920 the two Governments informed the League of Nations that the military alliance had been concluded, and that it was of purely defensive character. Belgium offered to conclude a similar agreement with Great Britain; indeed, her ardent hope was to see a

Belgo-Franco-British entente established. This could not be achieved; but Belgian foreign policy has endeavoured to maintain the traditions of the entente and to reconcile the British and French points of view. In the Locarno Pact (*q.v.*) Oct. 16, 1925, Germany, Belgium, France, Great Britain and Italy took note of the abrogation of the treaties for the neutralization of Belgium. A treaty signed in Paris May 22, 1926, by Great Britain, France and Belgium confirmed the abrogation of these treaties.

Belgium's policy has naturally been mainly influenced by the two problems of security and reparations (*see* the articles under those headings). Under the influence of the latter problem she joined the French in their occupation of the Ruhr (*q.v.*). In order to arrive at a practicable settlement of the reparations question, Belgium repeatedly sacrificed her rights of priority for the benefit of her Allies (*e.g.*, July 1920, Aug. 1921, July 1922). Belgium became a non-permanent member of the Council of the League of Nations on its formation, and remained so until 1927. Paul Hymans was elected the first president of the League.

The Treaty of Versailles guaranteed Belgium priority for the sum of 2,000,000 gold marks on reparations account. In addition her allies declared themselves ready to transfer Belgium's war debt (5,600,000,000fr.) to the German reparations account. In 1925 the United States required from Belgium recognition of her war debt, although the remission of this debt had been foreseen by the treaty. An arrangement was concluded with America regarding this debt on Aug. 18, 1925.

The question of the Schelde was not solved by the Treaty of Versailles. Belgium attempted to reach a *modus vivendi* on this subject with Holland; but no arrangement could be reached, as Holland laid claim not only to the sovereignty of the waters of the Schelde, but also to the sovereignty of the Wielingen channel which would have made possible the complete isolation of Belgium from the sea. On April 3, 1925, a new treaty was signed settling the relationship between the two countries. In 1927 a general treaty was drafted by the Belgian and Dutch Governments, which was accepted by the Belgian parliament but rejected by the parliament of the Netherlands.

Reconstruction.—After the conclusion of peace the Government was chiefly occupied with the problem of feeding the country, which necessitated various measures prohibiting export and authorizing the requisitioning of home-grown foodstuffs. In consequence of the destruction of industry, there were 800,000 unemployed in the country, and 2,400,000 persons, or one-third of the population, were dependent on public assistance. The State was obliged to create relief works immediately. The number of persons organized in trade unions rose from 200,000 in 1914 to 600,000 in 1919. By the end of 1919 the 2,000km. of railway which had been destroyed were reconstructed. Thanks to the recovery of the 24,000 Belgian machines brought back from Germany and to the huge orders for material placed in England and America (which were made possible by the credits granted to industry by the banks, these having enlarged their capital considerably for this purpose), industry recovered rapidly.

The reconstruction of the devastated regions, valued at over 35 milliard francs, called for very great sums; military pensions, indemnities for damage caused by war, unemployment doles swelled the budget disproportionately. In 1919 the public debt had risen from four milliard francs before the war to 13 milliards, and passed 30 milliards in 1921. At the same time the fall of the exchange continually increased the cost of living, necessitating a great increase of salaries and readjustment of wages. The demand for social legislation increased greatly. On Dec. 1, 1919, the working day was reduced to eight hours. To prevent or diminish conflicts, national councils, formed by delegates of the masters and the workmen in equal numbers, with an official as president, were set up after the Armistice. The action, although devoid of any legislative backing, was often successful. Similarly in the mining industry, especially in the basins of the Centre and Borinage, a whole system of arbitration was set up, freely organized by the masters and workmen. The financial measures of the Government were also democratic in tendency, including income tax, super-tax and an increase in succession duties.

The fall of the exchange impoverished the middle classes, holders of state papers and mortgages and small house owners. This was further accentuated by the housing law, permitting tenants to continue to occupy their dwellings, limiting the rent to a sum not exceeding 125% of the pre-war rents, while building costs had increased by 700%. On the other hand, the quick recovery of industry contributed to enrich the industrial and commercial classes. The high price of living also improved the conditions of the peasants, who spent enormous sums on acquiring land. Thus the middle classes were in a difficult situation between the rich capitalists on one side and the workmen and peasants on the other. The activity of the banks drained out all the free money in the country, and gave real power to the great financial establishments.

The considerable improvement in the condition of the working classes increased the power of the trades unions. The Socialist party formed the *Banque Belge du Travail*, while the increased wealth of the peasants gave the *Banque des Boerenbonden* very great financial and political power. The political result was the weakening of the Liberal Party, which was recruited from the middle classes, an access of strength for the Socialist and Catholic Parties, and an increase of the democratic element. The passing of a law which re-established the legal personality of associations not aiming at profits (June 27, 1921) also deserves mention. This law met a real demand, and the country is now covered everywhere with charitable, scientific or social associations. The religious establishments are all under this form.

The intellectual life of Belgium revived. The *Association Internationale des Académies* chose Brussels for its centre. On Aug. 19, 1920, an *Académie de Langue et de Littérature Française* was formed at Brussels. The status of legal personality benefited the free universities of Louvain and Brussels and the universities of Ghent and Liège. The profits realized by the Commission for Relief in Belgium went to constitute a university fund, with a capital of 80,000,000fr., for the development of the sciences in Belgium. Each university was further endowed with a capital of 20,000,000 francs. A war archives department was established to collect all documents bearing on the history of the war between 1914 and 1918. The period of restoration was blessed with a truce in the political struggle; unlimited universal suffrage from the age of 21 was introduced at the demand of the Socialist Party; female suffrage, which was claimed by the Catholic Party, was granted for communal elections.

The elections of Nov. 16, 1919, under the new franchise, resulted in the Catholic Party's losing the majority which it had held since 1884. At first the country was ruled by a "concentration" Government, under Delacroix and later by Carton de Wiart; afterwards by a coalition between Catholics and Liberals under Theunis; then after the elections of April 1925, in which the Socialists obtained 818,852 votes, Catholics 751,011, and Liberals 305,032, by a democratic Catholic-Socialist coalition under Goullet and Vandervelde. This ministry made an attempt to stabilize the franc. It failed, and the franc fell from 107 to 237 to the pound sterling.

Restoration of the Currency.—In May 1926 Henri Jaspar formed a coalition ministry consisting of representatives of the three great parties of Belgium. He made a vigorous effort towards financial stabilization, with the help of E. Francqui, who was principally responsible for the currency reform. He obtained from parliament legislation giving him full powers to carry out the necessary measures. Belgium was faced with a very serious situation; the internal floating debt amounted to \$6,346,000,000 francs, and the foreign debt to 54,000,000 dollars or two milliard francs. On June 7 parliament agreed to impose fresh taxation yielding one and a half milliards. On the same day there was set up an amortization fund intended to give the creditors of the State an assurance that the taxes voted for the amortization of the debt would actually be used for that purpose. On July 23 the State handed over the management of its railways to a national railway company. A royal decree was issued on July 31 converting the internal debt; the creditors of the State were given bonds, the rate of which was guaranteed, entitling them to a share in the profits derived from

the industrial exploitation of the railways. Under the influence of these measures, the franc rose to an exchange rate of 175, and it was stabilized at this rate by law. It was guaranteed by the constitution of a reserve of gold-value securities at the National Bank amounting to 40% of the value of the currency issued. In order to make the Belgian franc completely independent, a new currency was created, the Belga, which is equivalent to five Belgian francs. The Belga is a theoretical currency unit (one pound sterling is equivalent to about 35 Belgas).

The Jaspas ministry resigned in Nov. 1927, as the Socialist ministers refused to accept the military reform scheme drawn up by the Ministry of War. A new Jaspas ministry was formed consisting of a coalition between the Catholic and Liberal Parties.

During the years which followed the conclusion of peace, the popularity which the king and queen had acquired during the war did much to help in the maintenance of internal peace and order. In 1927 the king proposed the formation of a *Fond National de la Recherche Scientifique* to foster the intellectual development of the country. Opened in November, subscriptions speedily amounted to fr. 125,000,000. In June 1928 the king and queen visited the Belgium colony of the Congo. Prince Leopold, the heir to the throne, was married to Princess Astrid of Sweden in Nov. 1926. Activist agitation is still carried on by the "frontist" party (*frontpartij*), but is of no importance. The communists, who are opposed by the powerful socialist organization, do not appear likely to gain much ground. On the other hand, the Flemish question has become more acute since the introduction of universal suffrage. The demand however is still for nothing more than linguistic reforms within the Belgian State. An act adopted in 1921 made Flemish the administrative language of the Flemish-speaking districts of the country. French may, however, be used as well as Flemish in all communications to the public wherever a request to this effect is made by one-fifth of the municipal electors. Flemish is also being introduced in higher education. The University of Ghent was partially flemicized in 1923; the Catholic University of Louvain has become a bilingual university. The language position in 1920 nevertheless shows that French is still spreading. At that date there were in Belgium 2,855,835 persons speaking French only, 3,187,073 speaking Flemish only, and 960,960 speaking both languages.

1928.—During the summer of 1928 the chambers passed an important law on the recruitment and composition of the army, and the use of the French and Flemish tongues among the troops. The duration of service with the colours was fixed, as a general rule, at eight months. In Nov. 1928 a law was under discussion to amnesty a certain number of those condemned for war-time offences. The stabilization of the currency resulted in measures for the increase of official salaries. A transformation was effected in the railway system following the transfer of its management from the State to the *Société nationale des chemins de fer*. Great undertakings were decided upon for enlarging the port of Antwerp and improving its communications with the industrial basin of Liège. The negotiations undertaken with Holland after the World War were re-opened, but up till the end of 1928 without conclusive result.

BELGIUM, INVASION OF. The military rôle of Belgium in 1914 was determined by two considerations of fundamental importance: the geographical situation of the country, which,

seated astride the direct road from Berlin to Paris and Calais, had become the cockpit of Europe, and her international political situation as defined by the guarantee of perpetual neutrality.

THE STRATEGICAL SITUATION

In Article 7 of the treaty with Holland of 1839 it is laid down that "Belgium, within its territorial limits, shall form an independent and permanently neutral state, and is required to observe this same neutrality with regard to all other states." Of this treaty "all articles are drawn up under the guarantee of Austria, France, Great Britain, Prussia and Russia." This neutrality clearly implied that Belgium was under an obligation to use her military forces, not to repulse an aggressor at all costs—a task beyond her means and one for which there could be no justification—but in such a manner as to prevent that aggressor from obtaining any anticipated advantage in his operations against a third party, i.e., to suspend for an adequate period free passage along the great international strategic highway of which the axis is defined by the Meuse, the Sambre and the Oise. The mission of the Belgian army was to gain time and delay the enemy.

To this end the foremost and best position to occupy, supposing the enemy to come from the east, was the Meuse, with its steep scarp slopes and its two road and railway junctions, Namur and Liège. These two towns had been encircled by a ring of detached forts by Brialmont in Leopold II's reign so that they might act both as bridgeheads and as "points d'appui" from which, with the support of their guns, the field army could easily hold up enemy forces of equal strength. If the enemy brought up very superior forces facing the Meuse the Belgian army would avoid being engaged in a battle which it was foredoomed to lose. It would retire fighting, step by step on Antwerp—its base of operations and the national citadel—holding itself in readiness to move out again for the counter-offensive in co-operation with any relief force the Powers guaranteeing Belgium's neutrality should send to its assistance.

Such was the plan of campaign drawn up by King Albert; but unfortunately Belgium was in the throes of military reorganization when the World War broke out. The country had been slow in realizing that the rivalry between its powerful neighbours constituted a menace to itself. In 1913 parliament had voted a compulsory military service system which was to produce 340,000 men in ten years' time. Actually, on mobilization, only 117,000 men were available for the field army and 60,000 for the fortress troops. The field army, grouped in six army divisions and one cavalry division, was without any reserve drafts whatever; the fortress troops, composed of men aged 28-35 years were weak in cadres and poor in quality. The plan of concentration had been revised, but there had not been time to make out the time-table for rail transport.

Belgian Preparations.—On the evening of July 31 mobilization was ordered. On Aug. 2 it became known that the Germans had invaded the Grand Duchy of Luxemburg, and at 7 P.M. the ultimatum was presented to the Belgian minister of foreign affairs by the German ambassador in Brussels. "If Belgium behaves in a hostile manner to German troops, and particularly if she impedes their march forward by resistance on the part of the Meuse fortifications, or by the destruction of roads, railways, tunnels or other works, then Germany will be compelled to regard Belgium as an enemy." Belgium's reply to this injunction was the categorical refusal which her sense of honour and of her duties toward Europe demanded.

As it was definitely from the east that danger threatened, and as France had officially declared that she would respect the integrity of Belgian soil, the place of concentration indicated for the army was on the Meuse between Maastricht and Namur. But, as has been said, transport arrangements were still incomplete and a modification had to be adopted. The king ordered that the 3rd and 4th Divisions mobilized at Liège and Namur should remain in those fortresses with instructions to defend them to the last man. The remaining four divisions and the cavalry division were concentrated—the former by rail, the latter by road—in the zone Tirlemont-Perwez-Louvain, whence they were to proceed toward the Meuse with all possible speed.

THE ATTACK ON LIÈGE

As already stated, Liège and Namur were not designed to withstand a regular siege, but consisted of a ring of forts (12 at Liège, nine at Namur) which controlled the free use of the Meuse bridges and marked a favourable line of battle. Constructed about 1890, these forts, of triangular or rectangular design, had vaulted casemates of 2m. 50-cm. concrete and were completely out of date; they were armed with two 15-cm. guns in cupolas, two 12-cm. guns and two 21-cm. howitzers, besides some pompons in "éclipse" cupolas, all firing black powder.

Strength of Liège.—With the help of the 3rd Division the Liège garrison was brought up to about 30,000 men; Gen. Leman

THE FORTRESS OF LIÈGE SHOWING THE RING OF 12 FORTS, 9 MILES IN DIAMETER, AROUND THE CITY AND THE LINES OF THE GERMAN ADVANCE TO THE MEUSE. THE CITY WAS TAKEN ON AUG. 6, 1914 BUT THE FORTS HELD OUT UNTIL AUG. 16, AND WERE ONLY SILENCED AFTER THE GERMANS HAD BROUGHT UP LARGE HOWITZERS. THE DELAY CAUSED BY THE UNEXPECTED STUBBORNNESS OF THE BELGIAN RESISTANCE WAS OF GREAT VALUE TO THE ALLIES

was in command. While he hastened to have trenches dug between the forts, his main concern after Aug. 3 was to blow up the railway tunnels and barricade the roads leading from Germany. It was well that he did so, for on the 4th, at 8 A.M., six German columns crossed the frontier on the line Aix-la-Chapelle-St. Vith, and at noon gun and rifle fire were heard at Visé.

The importance of the fortress lay in the fact that it controlled the lines of march of the German 1st and 2nd Armies. Now the success of the plan of campaign conceived by the general staff in Berlin depended upon the rapid crossing of the Belgian plains by these armies, and Gen. von Moltke, to avoid being held up in any way by Liège, had planned to carry the position during the concentration period (while troops were being carried up by rail) with a special army composed of six brigades at peace strength and the three divisions of Gen. von der Marwitz's cavalry corps. Accordingly, Gen. von Emmich, with his "Army of the Meuse" (consisting of 25,000 riflemen, 10,000 cavalymen and 124 guns) was ordered to carry the place by a *coup de main*. The forts were to be masked by a few companies and their artillery neutralized by his batteries while six brigade columns would penetrate the intervals. This assault was to take place by night, and the columns were to make their way independently toward the town and storm this at daybreak. The aim of the whole enterprise was to secure the bridges before they could be destroyed. As regards the temerity of this scheme, it is only fair to say that von Moltke expected to find merely the normal garrison of 6,000 men in Liège.

German Advance.—On the morning of Aug. 4 the 4th Division followed by cyclists and chasseurs conveyed by motors, made its way rapidly along the Dutch frontiers to Visé. The roads had been barricaded with felled trees, and it was noon before the cavalry reached the Meuse, only to find the bridge submerged and the opposite bank lined with riflemen. On Aug. 5 a *coup de main* aimed at Ft. Barchon was severely punished by the short-range fire from the fortress guns. At 10 P.M. the various brigades having completed their reconnaissances and the installation of their batteries, moved concentrically to the attack.

The battle opened to the fitting natural accompaniment of heavy thunder showers. Of the five brigades which attacked on the right bank, four were completely repulsed. In the south the 38th and 43rd in particular suffered severe losses round about Boncelles; they retreated over five miles the next day. The 34th Brigade, which attacked alone on the left bank after crossing the Meuse near to the Dutch frontier, was held up for several hours near the northern outskirts of Liège by street fighting, and left 400 prisoners in the hands of the Belgians at the end of the encounter.

By a strange chance a half-company of Jägers, detached as a flank guard, made their way quite unopposed into the town, reaching the Rue Sainte Foi about 7 A.M., where the garrison headquarters were situated. An aide-de-camp of Leman and the captain of the company killed each other on the spot, and the escort, snatching up their rifles, put the Jägers to flight. This extraordinary incident led the commander of the defence to believe that the enemy had brought over considerable forces to the left bank. Fearing that the troops defending the right bank might be cut off, he at once sent them an order to recross the river, a decision by which the last of the German brigades was to benefit considerably. This brigade, the 14th, marching from east to west, was entrusted with the attack between Forts Fléron and Evgnée, but had been stopped short by rifle and gun fire in the intervening village, its advanced guard being decimated, its general and one colonel killed. It would probably have come to a definite standstill but for the arrival at this critical moment, by another stroke of fortune, of Gen. Ludendorff, who as von Emmich's deputy chief of the staff was watching the operations on behalf of the German 2nd Army and, as head of the operations section of the German general staff, had been the author of the plan of attack.

Attack Under Ludendorff.—Taking over the command he ordered a renewal of the attack and, as Leman had sent all his reserves to Boncelles, succeeded in pushing back the three weak battalions opposed to him in an all-night street battle. Toward 10 A.M. he arrived on the heights over Liège with his brigade reduced by half and almost without ammunition, uneasy rather than proud of his success, for there was no sign of the other attacking troops. A few small columns were visible in the distance turning westward; these were the victorious Belgian troops, recalled to the other bank by the order to retreat. They were, however, so exhausted that once they had left the trenches they were incapable of engaging in a fresh battle. Leman, acting on the belief that the whole of the German 7th and 10th Corps were against him, gave orders to the 3rd Division to rejoin the field army. He himself would continue to hold off the enemy with forts alone.

Thus Ludendorff was able to enter the town of Liège without further opposition on the morning of Aug. 8. Most of the bridges had been destroyed. The forts, all of which were still intact, kept watching roads and railways, their guns making the use of either impossible. Urged by Ludendorff's energetic representations, the German general staff now formed a new siege army, under Gen. von Eimen, which comprised, in addition to von Emmich's group, all the troops of the 7th, 9th and 10th Corps—taken as they detained—and some powerful heavy artillery, including several battalions of 21-cm. mortars and four 42-cm. howitzers. A new mode of attack was tried. One by one the forts were isolated, closely invested and bombarded with concentrated fire, which destroyed their gun emplacements and magazines and at the same time threatened to asphyxiate the garrisons.

Fall of the Forts.—The defenders came through their ordeal with honour, and would certainly have held out longer but for the irresistible effect of the 42-cm. shells. Pontisse, Fléron and Chaudfontaine only gave in when they had reached the limit of human endurance. On Aug. 15 at 5 P.M., the fort of Loncin blew up through the explosion of a powder magazine hit by a 42-cm. shell, 350 men being buried under the débris. By a stroke of luck Leman was picked up, unconscious, on the rim of this enormous crater by the Germans, who were themselves horrified by the spectacle. The last of the forts surrendered on the 16th, leaving the way clear, at last, for the Germans to whom the passage meant so much.

While these events were taking place at Liège, the 1st and 2nd, 3rd and 6th Divisions, and the Cavalry Division were assembling in the region Tirlemont-Perwez-Louvain. The plan of marching towards the Meuse was perforce abandoned on the information that the Liège position was broken and the 3rd Division in retreat.

CONSEQUENCES OF THE FALL OF LIÈGE

Belgian Position Outlined.—On the morning of Aug. 4, when the crossing of the frontier by German troops had become an established fact, King Albert had sent a note to the British, French and Russian Governments announcing the violation of Belgian neutrality, and proposing "a concerted and common action by the guaranteeing powers in order to resist Germany." In reply Gen. Joffre sent one of his staff officers to say that the French troops, amounting to four army corps, could not reach the region of Namur before about the 15th. Help from England would necessarily take still longer to come. Under these conditions the king decided that the army should remain in its positions, which were: (1) the forts of Liège, acting as isolated works, under Leman; (2) the fortress of Namur, reinforced by the 4th Division; (3) the entrenched camp of Antwerp, guarded by about 40,000 fortress troops; and (4) the field army, 90,000 strong, entrenched behind the river Gette, forming a link between Antwerp and Namur, covering Brussels and excellent railway lines which could be used by any French or British troops that came to the rescue.

Unfortunately, the Allies were not to profit by these arrangements. The French would not think of anything except their attack in Lorraine and the Ardennes; the British did not arrive at Mons before Aug. 22. As fast as the Liège forts fell to the super-guns the Germans commenced to push their troops across the Meuse without intermittence. As early as Aug. 10 Marwitz's cavalry corps had thrown itself on the Belgium front at Tirlemont. On the 12th he tried to turn that front through Haelen, near Diest. Here he met the small Belgian cavalry division, supported by four battalions, and was completely routed, leaving 500 killed and wounded and 1,000 horses on the field. On the evening of Aug. 17, the German 1st and 2nd Armies having reached the front Hasselt-St. Trond-Huy, the kaiser ordered the general advance. The next day, at 9 o'clock, Gen. von Kluck attacked the Belgians on the Gette between Tirlemont and Diest with seven divisions of the 9th, 4th, 3rd and 2nd Corps, while one division of the 2nd Corps and the 2nd Cav. Div. turned the left flank on the north to cut off the retreat on Antwerp.

Retreat to Antwerp.—This attack was no surprise to the king. For several days reports had been coming through that greatly superior forces of at least 200,000 men were approaching. Gen. Lanrezac's French troops had got only as far as Philippeville and the British Expeditionary Force as far as Le Cateau. To avoid useless and complete destruction, the Belgian army began to retire slowly on Antwerp, fighting rearguard actions at Tirlemont on the 18th and at Aerschot on the 19th, and taking up its position on the line of the Antwerp forts on the 20th. On this day the Germans entered Brussels.

THE SIEGE OF NAMUR

The Belgium 4th Division remained at Namur. The moment it lost touch with the bulk of the Belgian army, it became part of the fighting system of the Franco-British forces.

German Plan of Attack.—On the morning of Aug. 18 Joffre issued a succession of orders in which it was laid down that the

French 3rd and 4th Armies should advance into the Ardennes and the French 5th Army and the British Expeditionary Corps take the offensive west of the Meuse in the direction of Gembloux-Nivelles. Meanwhile, the Germans having discovered—through the reconnaissances of their airmen—the French columns marching northwards between Maubeuge and Dinant, gave von Bülow—already in command of the 1st and 2nd Armies—authority over the 3rd Army, which was to strike the Meuse between Namur and Givet, and made up their minds to overwhelm the Allied left by a converging attack delivered by 15 corps. It was essential to the scheme that the fortress of Namur should be carried with the least possible delay.

The task was entrusted to a special army detachment under von Gallwitz. It included the Guards Reserve Corps, the 11th Corps, three pioneer regiments, five battalions of 21-cm. howitzers, two battalions of heavy guns, one battery of 42-cm. howitzers and four of 30.5 Austrian howitzers. These troops came into position north-east of the fortress. To complete the investment the 3rd Army detached the 24th Reserve Division north of Dinant and the 2nd Army the 14th Reserve Division south of Gembloux. Thus during the two days of the battle of Charleroi the 30,000 men of the Namur garrison drew upon themselves six enemy divisions and 500 guns.

Bombardment of Namur.—The attack on Namur was quite different from that on Liège. There was no longer any question of a surprise. Von Gallwitz, who in peace time was inspector-general of artillery, aimed at an artillery preparation so devastating as to render the defence incapable of resistance to the assault. All his batteries concentrated their fire upon three forts, Maizeret, Marchevelette and Cognelée, and on the interval between the two last named, where he intended to make a breach. The bombardment commenced at 10 A.M. on Aug. 21, continued throughout the night and the whole of the following day, and reached its height on the morning of the 23rd. The trenches and the wire—at that time very slight—had disappeared. The forts were reduced to shapeless ruins; all their cupolas were put out of action.

Surrender of Namur.—Three French battalions had arrived in the fortress. A counter-attack, half Belgian, half French, attempted to repulse the enemy artillery, but failed. The defending troops suffered steady extermination without being able to fire a shot. Finally at 11 A.M. the German infantry masses made a sudden onrush—three divisions of them to a front of 4½ kilo.—held by what remained of nine battalions of 700 men. The defenders were swept off their feet. At many points, although enveloped, they put up a desperate resistance; and, as a result, it was not until evening that the assailant reached the outskirts of the town.

Gen. Michel, commanding the fortress, had disposed a brigade facing north-west to co-operate in the French offensive which he was impatiently expecting. At about 1.30 P.M. he heard, however, on the one hand that the French on his left had been driven back southward instead of advancing to the north, on the other that the Germans, far behind his right, had crossed the Meuse between Namur and Dinant. With their front broken the garrison ran the risk of being enveloped and surrounded. Michel therefore expedited the order for an immediate retreat toward the south-east.

By dint of 48 hours of forced marches—coming after three days' battle—the greater part of the garrison succeeded in rejoining the French troops and a fortnight later in reinforcing the Belgian army at Antwerp. Five or six thousand men of the rearguard were trapped between the flank corps of the German 2nd and 3rd Armies, and after several skirmishes, were forced to surrender. The six forts which were still active at Namur were able to hold up von Gallwitz's forces two days longer. Suarlee and Andoy only surrendered on the evening of Aug. 25 after having offered a memorable resistance to the enemy's mortars, which bombarded them simultaneously from all sides. BELGRADE (Serbian *Beograd*, i.e., "White Castle"), the capital of Yugoslavia. Pop. (1921) 111,740. Belgrade occupies a triangular foreland at the confluence of Sava and Danube; at the base stands Avala hill, the last outpost of the Rudnik mountains, and at the apex a cliff 200ft. high, crowned by the citadel, once white, but now maroon with age, used as prison and barracks. Behind the citadel are the beautiful gardens of Kalmegdan, with a famous river view, and behind them the city of white houses. It was formerly divided into the old town, the Russian town (*Sava Makhala* or Sava district), and the Turkish town (*Dorčol* or cross-road). Changes in the 19th century made the old divisions less clear and there grew the Tirazia, a suburb along the aqueduct or *Tirazi*. A few old plaster Turkish houses, with red-tiled roofs, are left among the insanitary riverside districts, but after 1860 Belgrade was rapidly transformed into a modern European town, with wide streets, electric tramways, electric lighting, telegraphs and telephones; while in the beginning of the 20th century, wireless was installed. Belgrade is the seat of the metropolitan of Serbia, with a cathedral. In addition to the university (with four faculties), educational facilities are afforded by a military academy, a theological seminary, a commercial academy and several secondary schools. The court of cassation sits at Belgrade, and also a court of appeal and a commercial tribunal.

There is a fine monument of Prince Michael (1860–68); a royal palace, much enlarged in 1925; an interesting national museum; a national library with a wealth of old Serbian mss; a national theatre; a botanical garden, rich in Balkan flora; while a new parliament house is being constructed. Commercial institutions include a chamber of commerce and many trade associations, and a national bank, privileged to issue notes.

The bulk of the foreign trade of Serbia finds its way through Belgrade, and the town itself is engaged in brewing, iron-founding, and the manufacture of cloth, woollen goods, boots, glue, sugar, soap, pottery, preserved meat, and confectionery. Belgrade is near good coal supplies, and in the neighbourhood are lead mines and quarries with excellent building stone and beautiful marbles. The main railway line of Yugoslavia runs north to meet the Hungarian line to Budapest, and south through Nish and Skoplje, to join the Greek line to Salonica. It has many branches and is connected with the Adriatic ports Split and Sibenik. The only high roads are one going north to Smederevo, and one south to Cattaro, all the others being merely country roads. South of the town is the park of Topchider, with an old Turkish kiosk built for Prince Milosh (1818–39). In the adjoining forest of lime trees, called *Koshnutyak* or the "deer park," Prince Michael was assassinated in 1868. Opposite the citadel, across the Danube, lies the town of Lemun (*Semlin*) which was Hungarian until 1918. For administrative purposes Belgrade forms a separate department of the kingdom.

The first fortification was made by Celts in the 3rd century B.C., with the name *Singidunum*, by which it was known until the 7th century A.D. The Romans took it from the Celts and replaced their fort by a regular Roman *castrum*. Between the 4th and 6th centuries A.D. it often changed masters (Huns, Sarmatians, Goths, Gepids); then the emperor Justinian made it Roman once more. Towards the end of the 8th century it was taken by the Franks of Charlemagne; in the 9th century by the Bulgarians, who held it till the beginning of the 11th century, when the Byzantine emperor Basil II. reconquered it for the Greek empire. The Hungarians, under King Stephen, took it from the Greeks in 1124. From that time it was again constantly changing hands—Greeks, Bulgarians, Hungarians replacing each other in turn. The city was considered to be the key of Hungary and of Serbia also, besides giving command of the traffic between the Upper and Lower Danube. It has, in consequence, seen more battles under its walls than most fortresses in Europe. The Turks

used to call it *Darol-i-Jehad*, the home of wars of the faith. During the 14th century it was in the hands of the Serbian kings, and was made the capital of Serbia in 1403 by Stephen, grandson of Prince Lazar. His successor, George Brankovich, ceded it to the Hungarians in 1427. From 1521 to 1688 it was in Turkish hands and again from 1739 to 1789 when the Austrians carried it by assault, and lost it again in 1792. In 1807 the Serbians having risen for their independence, took the town and held it until the end of Sept. 1813.

Up to 1862 the fortress and the Danubian slope of the town were inhabited by Turks, living under a special Turkish administration, while the modern part of the town (the plateau of the ridge and the western slope) was inhabited by Serbians living under their own authorities. This dual government was a constant cause of friction between the Serbians and the Turks, and on the occasion of one conflict between the two parties the Turkish commander of the fortress bombarded the Serbian part of the town (June 1862), which indirectly led, in 1866, to the withdrawal of the Turkish garrison from the citadel and its delivery to the Serbians. In 1878, by the treaty of Berlin, Belgrade became the capital of a Serbia freed at last from the Turkish suzerainty. The World War began with the bombardment of Belgrade by the Austrians on July 29, 1914. In November it was taken by the Austro-Germans, but the Serbs made a brilliant return, and in December King Peter made a triumphant entry into his capital. Large numbers of prisoners were taken, but they and their captors fell victims to a terrible plague of typhus. In Sept. 1915 a general attack was made by Austrians and Germans on the river frontier, and on Oct. 9 the town fell. It remained in the enemy's hands until the end of the war, when the kingdom of Yugoslavia came into existence.

BELHAVEN AND STENTON, JOHN HAMILTON, 2ND BARON (1656–1708), eldest son of Robert Hamilton, Lord Presmennan (d. 1696), was born on July 5 1656. He succeeded to the title of Belhaven and Stenton in virtue of his wife in 1670. In 1681 he was imprisoned for opposing the government and for speaking slightly of James, duke of York, in parliament, and in 1689 he was among those who asked William of Orange to undertake the government of Scotland. Belhaven was at the battle of Killiecrankie; he was a member of the Scottish privy council, and he was a director of the Scottish Trading Company, which was formed in 1695 and was responsible for the Darien expedition. He opposed the union of the English and Scottish parliaments, a speech which he delivered against this proposal in Nov. 1706 attracting much notice and a certain amount of ridicule. Later he was imprisoned, ostensibly for favouring a projected French invasion, and died in London on June 21 1708. Two of his speeches, one of them the famous one of Nov. 1706, were printed by D. Defoe in an appendix to his *History of the Union* (1786).

BELIEF is acquiescence in the reality of an object or assent to the truth of a proposition. The meaning of the term varies somewhat in different contexts. It is sometimes applied to the content of a belief, but more usually to the act or experience of believing. Somewhat more serious are the differences in the meaning of the term belief which arise from different contrasts. The principal contrasts are those (a) between *belief* and *knowledge*, (b) between *belief* and *disbelief*, (c) between *belief* and *doubt*, (d) between *belief* and *mere apprehension*. An explanation of these antitheses will help to clear up the nature of belief.

(a) **Belief and Knowledge.**—If anyone is asked whether he knows that man is immortal, he may reply, "I don't *know* but I *believe* that he is." Or again, if asked whether he believes that he has to pay income tax, he may reply, "I don't *believe* it, I *know* it." In these and similar cases the term belief is used for the act of assenting to something, accepting it as real or true, when the grounds of our assent are not strong enough to justify our calling it *knowledge*. It may be a more or less probable surmise, it may be prompted by "reasons of the heart," but it is not knowledge. It is rather like an act of faith—it is believed merely. To confine "belief" to this meaning is unsatisfactory. It may be said with obvious truth that if one can believe even what he does not know,

he certainly believes what he does know. It is therefore better to use the expression "mere (or bare) belief" for what has just been called "belief" when contrasted with knowledge. Strictly speaking all knowledge is belief, though not all belief is knowledge.

(b) **Belief and Disbelief.**—It clearly makes a difference whether the reality of something or the truth of a proposition is believed or disbelieved. The difference, however, is essentially a difference in the content or object of the belief, not a difference in the attitude or experience of believing. He who disbelieves that man is immortal really believes that man is mortal. And so generally to disbelieve a given proposition is to believe its contradictory. So that *quâ* experiences or attitudes belief and disbelief are essentially similar experiences directed towards contradictory contents or propositions, or simply to affirmative and negative propositions respectively.

(c) **Belief and Doubt.**—The difference between the assurance, conviction, mental rest or equilibrium characteristic of belief, and the unrest and vacillation characteristic of doubt, is palpable. Doubt in its extreme form becomes doubting mania and ends in the asylum. As a matter of mental economy people naturally tend toward belief. In the early stages of life, the stage of innocence or inexperience, every appearance is accepted as real and every suggestion as true. Doubt is the fruit of disappointment and of conflict of rival beliefs or suggestions. When practised reasonably it is an important factor in the make-up of a man of science, as Huxley rightly insisted. Such reasonable doubt is what is meant by a critical attitude of mind. But unreasonable doubt is as fruitless in science as is unreasonable belief, that is, credulity.

(d) **Belief and Mere Apprehension.**—Psychologically this is the most important distinction. Merely to imagine something, or to understand a suggestion, is one thing; to accept it as real or true is quite another thing. The former is mere apprehension, the latter is belief. One cannot, of course, believe (or disbelieve) what one does not apprehend (though some people seem to suppose that they can believe what they do not understand), yet one may apprehend something without believing or disbelieving it. In this respect belief may be compared with desire. It is one thing to think of something or apprehend it, and another to desire it (or even to have an aversion for it). Of course, one cannot desire what one does not apprehend (though one may experience a restless craving without knowing what he wants), but one can apprehend a thing without feeling either a desire or an aversion for it. Thoughts that are apprehended without being either believed or disbelieved are sometimes described as "floating ideas." Except perhaps in day-dreaming, in reading avowed fiction, and in aesthetic enjoyment "floating ideas" are probably uncommon. The suspension of judgment is a form of self-control or self-denial that most people find irksome—it is so much easier to have a definite belief or disbelief about everything between heaven and earth. This seems borne out partly by the popular identification of "not believing" something (which may denote merely a suspension of judgment) with "disbelieving."

Belief in the sense just explained is really equivalent to judgment—belief corresponding usually to positive judgments, disbelief to negative judgments. It was F. Brentano who gave vogue to the distinction between judgment and mere apprehension, on the ground that judgment involves what Stout has called the "yes-no-consciousness" over and above bare apprehension. This moment of belief or "yes-no-consciousness" seems to be something ultimate and unanalysable. But it is clearly variable in degree or fixity. There are many different (though hardly measurable) degrees of assurance with which a proposition is assented to or rejected.

It may just be noted in conclusion that some psychologists have identified belief with a certain feeling of vividness in the ideas or thoughts assented to (Hume); while others have treated it as a matter of will (Descartes, W. James, etc.).

BELINSKY, VISSARION GRIGORIEVICH (1811–1848), Russian critic, born on June 13, 1811, at Fribourg, and

died on June 9, 1848, at St. Petersburg; the son of an army doctor. At the University of Moscow he became friendly with Stankevich and other young writers, but he took no degree. On leaving the university, he wrote first of all for Nadzhdin's *Telescope*, and then after its suppression (1836), edited the *Moskovsky Nablyudatel*, of which Bakunin was at that time the proprietor. On the failure of this undertaking he became the principal literary critic of the *Otechestvennyia Zapiski* in St. Petersburg. By this time he had come under the influence of the philosophy of Hegel, and his early friends were surprised to find that their champion, who had always supported what was new and revolutionary in Russian literature, was supporting the existing social and political régime, but after a few years he returned to his earlier position, and now supported the advanced school of Russian writers who sought to give pictures of life with a social significance. In 1846 he became critic of the *Sovremennik*, which had been purchased by Nekrasov and Panayev. Next year he was obliged to leave Russia for reasons of health, and addressed to Gogol a letter criticizing Gogol's *Correspondence with Friends*, a letter which became a kind of profession of faith among young Russians.

His collected works were edited by Vengerov (1901–10) and his life was written by Pypine (1876). See also D. S. Mirsky, *History of Russian Literature* (1927), for an estimate of Belinsky's influence on Russian literature.

BELISARIUS (c. 505–565), one of the most famous generals of the later Roman empire, was born about A.D. 505, in "Germania," a district on the borders of Thrace and Macedonia. As a youth he served in the bodyguard of Justinian, who appointed him commander of the Eastern army. He won a victory over the Persians in 530, but was defeated in the following year. Recalled to Constantinople, he married Antonina, a favourite of the empress Theodora. During the Nika sedition (532) he did Justinian good service, crushing the rebels who had proclaimed Hypatius emperor. In 533 he was put in command of the expedition against the Vandal kingdom in Africa. With 15,000 mercenaries, he took Carthage, defeated Gelimer the Vandal king, and carried him captive to Constantinople (534). As a reward Belisarius received the consulship. At this time Justinian decided to attack Italy where the Ostrogothic kingdom was shaken by internal dissensions. Accordingly, Belisarius invaded Sicily (535) and, after storming Naples and defending Rome for a year against almost the entire strength of the Goths in Italy, he captured Ravenna, and with it the Gothic king Vitiges. The Ostrogoths offered to acknowledge him emperor of the West, but he rejected the proposal and returned to Constantinople in 540. Next year he was sent to check the Persian king Chosroes (Anushirvan); but achieved no decisive result. In 544, the Goths having meanwhile reconquered Italy, Belisarius was sent with inadequate forces to oppose them. During five campaigns he held his enemies at bay, until he was removed from the command. Belisarius remained at Constantinople in retirement until 559, when at the head of a mixed multitude of peasants and soldiers he repelled the Bulgarian savages who had invaded the city. But this, like his former victories, roused Justinian's envy. The saviour of his country was coldly received and left unrewarded by his suspicious sovereign. Shortly afterwards Belisarius was accused of complicity in a conspiracy against the emperor (562); his fortune was confiscated and he was imprisoned in his palace. He was set free and restored to favour in 563, and died in 565.

The fiction of Belisarius wandering as a blind beggar through Constantinople, which has been adopted by Marmontel in his *Bélisaire* and by various painters and poets, is first heard of in the 10th century. Gibbon justly calls Belisarius the Africanus of New Rome. He was merciful as a conqueror, stern as a disciplinarian, enterprising and wary as a general; while his courage, loyalty and forbearance seem to have been almost unsullied. He was the idol of his soldiers, a good tactician, but not a great strategist.

BELIT, signifying the "lady," *par excellence* in the Babylonian religion. Accadian translation of Sumerian *dingir-Nin*-(lil) consort of En-(lil) of Nippur. The earth god and his consort are called *Bêl* and *Beltu* "Lord and Lady" in the older interlinear texts, but the Accadian translation is not provided with the determinative for goddess, and there is no evidence that the Babylonians recognized any goddess under the name *Bêlti*, *Belti-ia* "My Lady," until the Cassite period, where the title stands for Zarbanit, the goddess of Babylon and consort of Marduk, the *Bêl* of that period. There arose, under the transformation of the pantheon by the priests of Marduk, a tendency to identify the great Sumerian deities Enlil and Ninlil with Marduk and Zarbanit, and the "goddess *Bêlit* of Babylon" is consequently identified with the Wagon star, which in astrology is the constellation of Ninlil. The Babylonian goddess *Bêlti*, "my lady," or *Belit-ni*, "our lady," invariably means Zarbanit, spouse of Marduk, the *Bêl* of Babylon. It appears to have been given to Zarbanit after she had been identified with the great mother goddess *Makh*, called *bêlit-ilâni*, "queen of the gods," and more especially was "my lady" employed in addressing Ishtar, the mother and sister of Tammuz. In the later period Marduk and Zarbanit were identified with these deities (see TAMMUZ) and consequently "our lady," "my lady," originally addressed to Ishtar, became the title of Zarbanit. In survivals of the Tammuz cult in post-Babylonian times, Ishtar or Zarbanit, mother and sister of the dying god, appears in Aramaic and Arabic as *Bellin*, "our lady." By *Beltis* the Greeks refer to Zarbanit of Babylon as well as to Aphrodite, the Semitic Ba'alat of Byblus. *Bêlti* is the Latin transcription used by Philo, of Biblus.

BELIZE, the capital and principal seaport of British Honduras, on the Caribbean Sea, in 17° 29' N. and 88° 11' W. (Pop. est. 12,600), occupies both banks of the river Belize, at its mouth. The ground is very little above sea level and the town is divided from the mainland by miles of swamps, the unhealthiness of which is mitigated by tidal inflow and fresh sea breezes. Its houses are generally built of wood on piles, with high roofs and wide verandahs, and shaded by coco-nut or cabbage palms. The town is not unhealthy and the winter climate is pleasant. The swamps adjacent are being cut back and cleared and the level of the land raised by dredgings. Belize is connected by telegraph and telephone with the other chief towns of British Honduras, but communication by road is defective. The chief exports are mahogany, cedar, logwood, coco-nuts, sarsaparilla, tortoiseshell, deerskins, turtles and fruit, especially bananas. Breadstuffs, cotton fabrics and hardware are imported.

Belize probably derives its name from the French *balise*, "a beacon," some signal for the guidance of the buccaneers who once infested this region. Local tradition, however, connects the name with that of Wallis or Wallace, a Scottish buccaneer who, in 1638, settled with a party of logwood cutters on St. George's Cay, a small island off the town. In the 18th century the names Wallis and Belize were used interchangeably for the town, the river and the whole country. (See BRITISH HONDURAS.)

BELJAME, ALEXANDRE (1842-1906), French writer, was born at Villiers-le-Bel, Seine-et-Oise. He spent part of his childhood in England and was a frequent visitor in London. His lectures on English literature at the Sorbonne, where a chair was created expressly for him, did much to promote the study of English in France. In 1905-06 he was Clark lecturer on English literature at Trinity college, Cambridge. His best known book, *Le Public et les hommes de lettres en Angleterre au XVIII^e siècle* (1881), a masterly study of the conditions of literary life in England in the 18th century illustrated by the lives of Dryden, Addison and Pope, was crowned by the French Academy on the appearance of the second edition in 1897. He was a good Shakespearean scholar, and his editions of *Macbeth*, *Othello* and *Julius Caesar* also received an academic prize in 1902.

BELKNAP, WILLIAM WORTH (1829-1890), American soldier and politician, was born at Newburgh, N.Y., on Sept. 22, 1829. Entering the Union army in 1861, he took part in the battles of Shiloh, Corinth and Vicksburg, as major of the 15th Iowa volunteers. In the Atlanta campaign under Sherman he

gained distinction, rising to the rank of brigadier-general in 1864 and major-general in 1865. Until 1869 he was collector of internal revenue for Iowa, leaving that post to become secretary of war. In 1876, because of unproved accusations of corruption, he resigned. He died at Washington, D.C., on Oct. 13, 1890.

BELL, ACTON, CURRER AND ELLIS: see BRONTË, CHARLOTTE, EMILY AND ANNE.

BELL, ALEXANDER GRAHAM (1847-1922), American inventor and physicist, inventor of the telephone; son of Alexander Melville Bell, was born in Edinburgh, Scotland, on March 3, 1847. He was educated at the University of Edinburgh and the University of London, and, because of failing health, removed with his father to Canada in 1870. In 1872 he opened in Boston a school for training teachers of the deaf and also gave instruction in the mechanics of speech. The following year he became professor of vocal physiology in Boston university. He exhibited in 1876 an apparatus embodying the results of his studies in the transmission of sound by electricity, and this invention, with improvements and modifications, constitutes the modern telephone (*q.v.*). He was the inventor also of the photophone, an instrument for transmitting sound by vibrations in a beam of light, and of phonographic apparatus. Later, he interested himself in the problem of mechanical flight. He gave numerous addresses and published many scientific monographs, including one on the formation of a deaf variety in the human race. Bell was the founder of the American Association to Promote the Teaching of Speech to the Deaf, was for a time president of the National Geographic Society, appointed by Congress in 1898 a regent of the Smithsonian Institution, and was a member of many learned societies. He died on Aug. 2, 1922, at his summer home near Baddeck, Nova Scotia.

BELL, ALEXANDER MELVILLE (1819-1905), American educationalist, was born at Edinburgh, Scotland, on March 1, 1819. He studied under and became the principal assistant of his father, Alexander Bell, an authority on phonetics and defective speech. From 1843 to 1865 he lectured on elocution at the University of Edinburgh, and from 1865 to 1870 at the University of London. In 1868, and again in 1870 and 1871, he lectured in the Lowell Institute course in Boston. In 1870 he became a lecturer on philology at Queen's College, Kingston, Ont.; and in 1881 he removed to Washington, D.C., where he devoted himself to the education of deaf mutes by the "visible speech" method of orthoepy, in which the alphabetical characters of his own invention were graphic diagrams of positions and motions of the organs of speech. He held high rank as an authority on physiological phonetics and was author of numerous works on orthoepy, elocution and education, among which were *Steno-Phonography* (1852); *Letters and Sounds* (1858); *Principles of Speech and Dictionary of Sounds* (1863); *Visible Speech: The Science of Universal Alphabets* (1867); *Sounds and their Relations* (1881); *A Popular Manual of Visible Speech and Vocal Physiology* (1889); *The Science of Speech* (1897); *The Fundamentals of Elocution* (1899).

See John Hitz, *Alexander Melville Bell* (Washington, 1906).

BELL, ANDREW (1753-1832), British divine and educationist, was born at St. Andrews, Scotland. He graduated there, was a tutor in Virginia, U.S.A., and from 1789 superintendent of an orphan asylum at Madras. There scarcity of teachers led him to introduce the system of mutual tuition by the pupils. In 1797, after his return to London, he published a small pamphlet, *An Experiment in Education*, explaining his views on the subject. Little public attention was drawn towards the "monitorial" plan till Joseph Lancaster (*q.v.*), the Quaker, opened a school in Southwark, conducting it in accordance with Bell's principles, and improving on his system. Similar schools were established in great numbers; and the members of the Church of England resolved to set up similar institutions in which their own principles should be inculcated. In 1807 Bell was called from his rectory of Swanage, in Dorset, to organize a system of schools in accordance with these views, and in 1811 he became superintendent of the newly-formed National Society for Promoting the Education of the Poor in the Principles of the

Established Church. He was made a prebend of Westminster and master of Sherburn hospital, Durham, and was buried in Westminster Abbey. His great fortune was bequeathed almost entirely for educational purposes.

See J. D. Meiklejohn, *An Old Educational Reformer*.

BELL, SIR CHARLES (1774–1842), Scottish anatomist, was born at Edinburgh. Educated at the high school and the University of Edinburgh, he devoted himself chiefly to the study of anatomy, under the direction of his brother John. In 1802 he published a series of engravings showing the anatomy of the brain and nervous system taken from dissections made for the lectures or demonstrations he gave on the nervous system as part of the course of anatomical instruction of his brother. In 1804 he migrated to London. Before leaving Edinburgh, he had written his work on the *Anatomy of Expression*, in which he gave a rational explanation of the muscular movements which usually accompany the various emotions and passions.

In 1811 Bell published his *New Idea of the Anatomy of the Brain*, in which he announced the discovery of the different functions of the nerves corresponding with their relations to different parts of the brain; his latest researches were described in *The Nervous System of the Human Body* (1830), a collection of papers read by him before the Royal Society. He discovered that in the nervous trunks there are special sensory filaments, the office of which is to transmit impressions from the periphery of the body to the sensorium, and special motor filaments which convey motor impressions from the brain or other nerve centre to the muscles. He also showed that some nerves consist entirely of sensory filaments and are therefore sensory nerves, that others are composed of motor filaments and are therefore motor nerves, whilst a third variety contains both kinds of filaments and is therefore to be regarded as sensory-motor. Lastly, he showed that the anterior roots of the spinal nerves are *motor*; the posterior are *sensory*. These discoveries as a whole must be regarded as the greatest in physiology since that by William Harvey of the circulation of the blood.

In the year 1812 he was appointed surgeon to the Middlesex hospital, a post he retained for 24 years. He was also professor of anatomy, physiology and surgery to the College of Surgeons of London, and for many years teacher of anatomy in the school which used to exist in Great Windmill street. In 1815 he went to Brussels to treat the wounded of the battle of Waterloo. In 1836 he accepted the chair of surgery in the University of Edinburgh. He died at Hallow Park near Worcester on April 28, 1842.

BIBLIOGRAPHY—Bell's chief works, other than those mentioned, are: *System of Comparative Surgery* (1807); *Lectures Concerning the Diseases of the Urethra* (1810); *Quarterly Reports of Cases in Surgery* (1816–18); *Observations on Injuries of the Spine and of the Thigh Bone* (1824); and *Practical Essays* (1841).

BELL, CHARLES FREDERICK MOBERLY (1847–1911), British journalist, was born in Alexandria, Egypt. Educated privately in England, he returned to Egypt in 1865, and there took up journalistic work, becoming *The Times* correspondent and founding *The Egyptian Gazette*. He had been *The Times* correspondent in Egypt for nearly 20 years when Mr Walter called him to London in 1890 at a moment when the fortunes of the paper were at their lowest ebb, after the Parnell-Piggott scandals. Although in some ways rather out of touch with technical developments, his strong will, indomitable courage and tremendous industry were instrumental in keeping *The Times* alive during some very difficult years. He enormously improved the foreign service; he wrote with his own hand to *The Times* correspondents abroad, giving them all the encouragement and backing in his power. This was the time when he was associated with Mr. H. E. Hooper in publishing and selling *The Encyclopedia Britannica* and founding *The Times Book Club*. His dominating personality again asserted itself in 1908, when, in spite of much opposition, he brought about the sale of *The Times* to Lord Northcliffe. He then became managing editor, a post he retained until his death in his office chair on April 5 1911. In the introduction to his daughter's *Life* of him Sir Valentine Chirol says that if it was not given to Moberly Bell himself to bring *The Times* into smooth waters, "it was he who, in the

darkest hours, saved it from utter shipwreck." While in Egypt, Bell wrote several books, including *Khedives and Pashas* (1884); *Egyptian Finance* (1887); *From Pharaoh to Fellah* (1889).

BIBLIOGRAPHY.—See F. Harcourt Kitchin, *Moberly Bell and his Times* (1925); E. H. C. Moberly Bell, *Life and Letters of C. F. Moberly Bell* (1927).

BELL, GEORGE JOSEPH (1770–1843), Scots jurist, born at Edinburgh on March 20, 1770, an elder brother of Sir Charles Bell, became advocate in 1791. He was one of the earliest and best friends of Francis Jeffrey. In 1804 he published a *Treatise on the Law of Bankruptcy* in Scotland which he enlarged and published in 1826 as *Commentaries on the Law of Scotland and on the principles of Mercantile Jurisprudence*—an institutional work of the highest excellence, praised by such jurists as Story and Kent. In 1821, Bell was elected professor of the law of Scotland at Edinburgh, and in 1831 appointed one of the principal clerks in the Supreme Court. He was put at the head of a commission in 1833 to enquire into the Scottish bankruptcy law; through the reports of the Commissioners, chiefly his handiwork, useful alterations were made. He died on Sept. 23, 1843. Bell's treatise, *Principles of the Law of Scotland*, became a textbook for students. *The Illustrations of the Principles* is also a work of high value. He is one of the four institutional authors who are cited as "authorities" in the Scots courts.

BELL, GERTRUDE MARGARET LOWTHIAN (1868–1926), English traveller and administrator, daughter of Sir Hugh Bell, Bart., by his first marriage, was one of the most remarkable women of her time. Her childhood was spent in the charming surroundings and liberal atmosphere of the Yorkshire home of her father and step-mother, Florence Bell, with both of whom she maintained affectionate and intellectual sympathy. With them and many others she carried on a correspondence of extraordinary spirit and distinction. A comparatively small part was edited by Lady Bell with cramping respect for the political exigencies of the day, and published in 1927 in two volumes under the title of *The Letters of Gertrude Bell*. A brilliant academic career at Oxford, where she took a First in History in 1887, was followed by more than a decade of intimate association with the best intellectual society. While she had opportunities of making herself familiar with the political life of several European countries, her life-work began during a visit to her uncle, Sir Frank Lascelles, then British Minister at Tehrān. The spell of the East claimed her for good. To this period we owe her translations of Hafidh, already foreshadowing the literary power and sympathy with orientalism manifest in works following at intervals. The fullness of her knowledge and strength were shown in an official report on the administration of Mesopotamia during the difficult period between the Armistice of 1918 and the rebellion of 1920.

At the end of 1899 Gertrude Bell entered on the Arabian activities which made her one of the memorable travellers. In that year she visited Jerusalem, travelling widely in Syria and Palestine. The next decade saw her back in those parts on frequent occasions. Her experiences, archaeological exploration playing an important part, were recorded in an admirable series of works. *Safar-Nama; Amurath to Amurath; Syria, the Desert and the Sown*; and, in conjunction with Sir William Ramsay, *The Thousand and One Churches*. By this time she was an acknowledged authority on Asia Minor and the northern borderlands of Arabia, but her heart was set on a journey into the interior of Arabia. In spite of many obstacles she embarked on this venture in 1913, travelling from Damascus and eventually reaching Hāil, whither only one European woman (Lady Anne Blunt) had ever penetrated before her. Received coldly by the authorities of Hāil and prevented from travelling farther south, she returned to Baghdad and thence across country to Damascus.

In ordinary circumstances this remarkable journey might have stood out as the chief feat of her life. But its results she never was to have time to publish. Soon after her return to civilization in 1914 the World War began and Gertrude Bell, after a short spell of war work in England and France, returned to the East. A short period in the Arab Bureau and a visit to the viceroy of India were preliminary steps to an appointment in Mesopotamia which in

various guises she retained to the day of her death. At first she worked with conspicuous success on the collection and collation of intelligence respecting the Arab tribes. In March 1917 she joined Sir Percy Cox at Baghdad in the actual, though not nominal, capacity of political secretary and played a strong part in the moulding of a scheme for the post-war administration of Mesopotamia. She next served Sir Arnold Wilson in a similar capacity, but her lack of sympathy with his policy manifested itself in almost open insubordination and in direct correspondence with the political chiefs in London. The situation had become acute when the rebellion once more threw the whole Mesopotamian problem into the melting pot. Sir Arnold Wilson was replaced by Sir Percy Cox and Gertrude Bell again assumed a dominating influence on affairs. For some months all went well with the provisional Arab Government set up in fulfilment of British promises, but no one played a more vigorous part than Gertrude Bell in upsetting this arrangement in favour of a Sharifian régime. Her notorious antipathy to Saiyid Talib Pasha, principal factor in the provisional Government, ranged her with friends of Feisul, recently ejected by the French from his Syrian throne. She worked powerfully at the Conference of Cairo (1921) to secure that Feisul should be offered the throne of 'Iraq and, on her return to Baghdad, she brought about the exile of Saiyid Talib. Feisul became king and for the next two years Gertrude Bell was the life and soul of a régime often shaken but left standing, thanks largely to her. By 1923, when Sir Percy Cox was succeeded by Sir Henry Dobbs, Gertrude Bell's work was done. Unable, however, to leave the country to which she was passionately devoted, she accepted the post of Honorary Director of Antiquities, and lavished all her zeal on the creation of a museum at Baghdad. There, in July 1926, worn out by years of strenuous work, she died and was buried.

See *Letters of Gertrude Bell* (2 vols., 1927), ed. Lady Bell.

(H. Sr. J. B. P.)

BELL, HENRY (1767–1830), the Scottish engineer, who placed the first steamboat on the Clyde, was born in Torphichen, Linlithgowshire, in 1767. He was apprenticed to his uncle, a millwright, and then to a shipmodeller at Bo'ness. He then went to London, where he found employment under John Rennie. Returning to Scotland in 1790, he first settled as a carpenter at Glasgow and afterwards removed to Helensburgh, on the Firth of Clyde, where he pursued his mechanical projects, and also found occasional employment as an engineer. In Jan. 1812 he placed on the Clyde a steamboat (which he named the "Comet") of about 25 tons, propelled by an engine of three horse-power, at a speed of seven miles an hour. Although the honour of priority is admitted to belong to the American engineer Robert Fulton, there appears to be no doubt that Fulton had received very material assistance in the construction of his vessel from Bell and others in Great Britain. A handsome sum was raised for Bell by subscription among the citizens of Glasgow, and he also received from the trustees of the River Clyde a pension of £100 a year. He died at Helensburgh on Nov. 14, 1830. A monument to his memory stands on the banks of the Clyde, at Dunglass, near Bowling.

BELL, HENRY GLASSFORD (1803–1874), Scots lawyer and man of letters, was born at Glasgow, and was called to the Scottish bar in 1832. He became sheriff substitute (1839), and then sheriff-principal (1867) of the county of Lanark. He was a member of the brilliant circle of *Blackwood's Magazine*, and figures in John Wilson's *Noctes Ambrosianae* as "Tallboys." His principal works were *Summer and Winter Hours* (1831); *Life of Mary, Queen of Scots* (2 vols., 1828–31), a brilliant defence, though rendered obsolete by later research; *Romances and Minor Poems* (1866), which show a sentimental, if undogmatic, sympathy for Roman Catholicism.

BELL, JACOB (1810–1859), British pharmaceutical chemist, was born in London on March 5, 1810. On the completion of his education, he joined his father in business as a chemist in Oxford street, and at the same time attended the chemistry lectures at the Royal Institution, and those on medicine at King's college. Always keenly alive to the interests of chemists in general, Bell originated in 1841 the scheme for the foundation of

the Pharmaceutical Society of Great Britain. He also established the *Pharmaceutical Journal*, superintending its publication for eighteen years. In 1845 Bell drew up the draft of a bill to deal with the practice of pharmacy by unqualified persons, one of the provisions of which was the recognition of the Pharmaceutical Society as the governing body in all questions connected with pharmacy. In 1850 Bell entered parliament for St. Albans, and in 1851 he brought forward a bill which, however, when eventually it became law, only partially represented its sponsor's intentions. Bell wrote an *Historical Sketch of the Progress of Pharmacy in Great Britain*. He died on June 12, 1859.

BELL, JOHN (1691–1780), Scottish traveller, was born at Antermoney, in Scotland, in 1691, and studied medicine. In 1714 he set out for St. Petersburg, where, through the introduction of a countryman, he was nominated medical attendant to Valensky, recently appointed to the Persian embassy, with whom he travelled from 1715 to 1718. The next four years he spent in an embassy to China, passing through Siberia and the great Tatar deserts. He had scarcely rested from this last journey when he was summoned to attend Peter the Great in his perilous expedition to Derbend and the Caspian Gates. In 1738 he was sent by the Russian government on a mission to Constantinople. In 1747 he retired to his estate of Antermoney, where he spent the remainder of his life. His *Travels*, published at Glasgow in 1763, went through many editions, and are reprinted in Pinkerton's *Voyages and Travels* (vol. vii., 1811). A complete French translation appeared in 1766.

BELL, JOHN (1797–1869), American political leader, was born near Nashville, Tenn., on Feb. 15, 1797. He graduated at the University of Nashville in 1814, and in 1817 was elected to the State senate, but retiring after one term, he devoted himself for ten years to the study and the practice of the law. From 1827 until 1841 he was a member of the national House of Representatives, of which from June 1834 to March 1835 he was the Speaker, and in which he was conspicuous as a debater and a conservative leader. Though he entered political life as a Democrat, he became estranged from his party's leader, President Jackson, also a Tennessean, and after 1835 was one of the leaders of the Whig party in the South. In March 1841 he became the secretary of war in President Harrison's Cabinet, but in September, after the death of Harrison and the rupture between the Whig leaders and President Tyler, he resigned this position. From 1847 until 1859 he was a member of the United States Senate, and attracted attention by his ability in debate and his political independence, being one of two Southern senators to vote against the Kansas-Nebraska bill of 1854 and against the admission of Kansas with the Lecompton or pro-slavery constitution in 1858. Strongly conservative by temperament and devoted to the Union, he ardently desired to prevent the threatened secession of the Southern states in 1860, and was the candidate, for the presidency of the Constitutional Union party, often called from the names of its candidates for the presidency and the vice-presidency (Edward Everett) the "Bell and Everett party," which was made up largely of former Whigs and Southern "Know-Nothings," opposed sectionalism, and strove to prevent the disruption of the Union. The party adopted no platform, and discarding all other issues, resolved that "it is both the part of patriotism and of duty to recognize no political principle other than the constitution of the country, the union of the states, and the enforcement of the laws." Bell was defeated, but received a popular vote of 587,830 (mostly cast in the Southern states), and obtained the electoral votes of Virginia, Kentucky and Tennessee—39 altogether, out of a total of 303. Bell tried earnestly to prevent the secession of his own state, but after the issue of President Lincoln's proclamation of April 15, 1861, calling on the various states for volunteers, his efforts were unavailing, and when Tennessee joined the Confederacy Bell "went with his state." He took no part in the Civil War, and died Sept. 10, 1869.

BELL, ROBERT (1800–67), Irish man of letters, was born at Cork Jan. 16 1800, and died in London on April 12 1867. He was educated at Trinity College, Dublin, where he was one of the

founders of the Dublin Historical Society. His most important work is his annotated edition of the *English Poets* (1854-57; new ed., 1866), the works of each poet being prefaced by a memoir. He was a director of the Royal Literary Fund, and well known for his open-hearted generosity to fellow men of letters.

BELL. The number of different forms assumed by bells is very large, not all of which need be dealt with here. The term does not strictly include gongs, cymbals, metal plates, resonant bars of metal or wood, or tinkling ornaments, such as, e.g., the "bells" upon the Jewish high priest's dress (Exodus xxviii. 32); nor is it necessary here to deal with such varieties as sheep or cow bells, or bells on sledges or harness. For house bells see the end of this article. A "diving-bell" (see **DIVERS**) is only so called from the analogy of its shape. The main interest of bells and bell-ringing has reference to church or tower bells, their history, construction and uses.

Early Bells.—Of bells before the Christian era there is no trustworthy evidence. The instruments which summoned the Romans to public baths or processions, or that which Lucian (A.D. 180) describes as set in motion by a water-clock (*clepsydra*) to measure time, were probably cymbals or resonant plates of metal, like the timbrels (*corybantia aera*, Virg. *Aen.* iii. 111) used in the worship of Cybele, or the Egyptian *sistrum* (q.v.), which seems to have been a sort of rattle. The earliest Latin word for a bell (*campana*) is late Latin of the 4th or 5th century A.D.; and the first application of bells to churches has been ascribed to Paulinus, bishop of Nola, in Campania, about A.D. 400. There is, however, no confirmation of this story.

It has been maintained with somewhat more reason that Pope Sabinianus (604) first used church bells; but it seems clear that they were introduced into France as early as 550. In the 7th century Bede mentions a bell brought from Italy by Benedict Biscop for his abbey at Wearmouth, and speaks of the sound of a bell being well known at Whitby abbey at the time of St. Hilda's death (680). St. Dunstan hung many in the 10th century; and in the 11th they were not uncommon in Switzerland and Germany.

Several old bells are extant in Scotland, Ireland and Wales; the oldest are often quadrangular, made of thin iron plates hammered and riveted together. A well-known specimen is St. Patrick's bell, preserved at Belfast, called *Clog an eadhachta Phatraic*, "the bell of St. Patrick's will." It is 6in high, 5in broad, 4in deep, adorned with gems and gold and silver filigree-work; it is inscribed 1091 and 1105, but it is probably alluded to in Ulster annals in 552. In these early times bells were usually small; even in the 11th century a bell presented to the church at Orleans weighing 2,600lb. was thought large.

To these scanty records of the early history of bells may be added the enumeration of different kinds of bells by Hieronymus Magius, in his work *De Tinninabulis*: (1) *Tinninabulum*, a little bell, otherwise called *tinniolum*, for refectory or dormitory, according to Joannes Belethus, but Guillaume Durand names *squilla* for the refectory; (2) *Petasius*, or larger "broad-brimmed hat" bell; (3) *Codon*, orifice of trumpet, a Greek hand-bell; (4) *Nola*, a very small bell, used in the choir, according to Durand; (5) *Campana*, a large bell, first used in the Latin churches in the steeple (Durand), in the tower (Belethus); (6) *Squilla*, a shrill little bell. We read of *cymbalum* for the cloister (Durand) or *campanella* for the cloister (Belethus); *nolula* or *dupla* in the clock; *signum* in the tower (e.g., in the *Excerptions* of St. Egbert, 750); the Portuguese still call a bell *sino*.

Bell-founding.—The earliest bells were probably not cast, but made of plates riveted together. Later, when casting was adopted, the earliest founders were often peripatetic artificers, who travelled about the country, setting up a temporary foundry to cast bells wherever they were wanted.

The chief English centres of the art in mediaeval times were London, York, Gloucester and Nottingham; and bells by "John of York" (14th century), Miles Graye (1605), Samuel Smith, father and son, of York (1680-1730), Abraham Rudhall and his descendants, of Gloucester (1684-1774), Mot (16th century), Lester and Pack (1750), Christopher Hodson of London (who cast "Great Tom" of Oxford, 1681), Richard Phelps (1716) and

H. Bagley (18th century) are still in high repute. The White-chapel Bell Foundry (now Mears and Stainbank), established by Robert Mot in 1570, incorporated the business of the Rudhalls, Lester and Pack, Phelps, Briant and others, and is now one of the leading firms of bell-founders; others being Gillett and Johnston, Croydon, and Taylor and Company, Loughborough, the founders of "Great Paul" for St. Paul's cathedral (1881).

Bell-metal is a mixture of copper and tin in the proportion of about four to one. In Henry III's reign it was about two to one. In Layard's Nineveh bronze bells, it was ten to one. Zinc and lead are used in small bells. The thickness of the bell's sound bow (or edge) ranges from one-twelfth to one-fifteenth of its diameter, and its height is approximately 12 times its thickness.

Bells have been made of the most various shapes within certain limits. The long narrow bell, the quadrangular, and the mitre-shaped all indicate, in Europe at least, antiquity, while the graceful curved-inwardly-midway and full trumpet-mouthed bell indicates an age not earlier than the 16th century.

The bell is first designed on paper according to the scale of measurement. Then the outer mould is formed in an iron case lined with loam—a mixture of special adhesive kinds of sand, cow-hair and other ingredients. The "strickle board" is fixed to an arm and central bar, and is swept round the loam until the required shape has been formed in the case. The inner mould, called the core, consists of a structure built up of bricks tier upon tier, coated with the same loam as that used in the case. This mould is formed by the other strickle board in a similar manner. These are the first, or rough, coats, and the moulds are then placed in the ovens to be thoroughly dried. This process may take two or three days in the case of a medium-sized bell, and longer in the case of larger bells.

The moulds are next brought out and coated a second time with a finer mixture of loam, and then returned again to the ovens to be dried. After this they are blacked and the surfaces "sleeked" so that the castings may come out clean and smooth. At this stage any inscriptions that may be required are stamped on the outer mould. The moulds are then put together, the case fitting over the core, and the metal, having been brought to the correct temperature, is then poured into each mould. The cooling process takes about 24 hours in the case of moderate sized bells or as much as a week in the case of larger ones. The case is then lifted off, the core is knocked out, and the bell is trimmed and sand-blasted to remove the black and grease. American founders use buffing wheels to bring a high polish to the surface of their bells.

Bell Tones and Tuning.—A good bell, properly struck, should give out two distinct notes—the strike note or key of the bell, and the hum note. There are other tones present, but these are not annoying to the ear if the bell is correctly made. The hum note should be a major sixth below the strike note. Such a bell possesses a full, round tone, and as it should be cast thick, it ought to last through the ages.

The pitch of a bell may be lowered by grinding away some of the metal on its inner surface and thus increasing its diameter; and raised by grinding the edge which decreases its diameter. But any alteration of a good bell, after it is cast, is apt to injure the quality of its tone.

In tuning a "ring" or series of bells, the practice of founders was formerly to take one set of notes (in England usually the nominals, on the Continent the fundamentals) and put these into tune, leaving the other tones to take care of themselves. But during recent years tuning methods have been vastly improved, with the aid of modern mechanical appliances, and all the five tones of a bell can now be tuned with perfect accuracy. The great bell ("Great Paul") cast by Messrs. Taylor for St. Paul's cathedral, London, has not all its tones in true harmony, but the great bell cast by the same founders for Beverley Minster is in perfect tune; and with the improved machinery now in use there is no reason why this should not be the case with all church bells.

History and Uses of Bells.—The history of bells is full of romantic interest. In civilized times they have been intimately associated, not only with all kinds of religious and social uses,

but with almost every important historical event. Their influence upon architecture has been not less remarkable, for to them indirectly we owe probably most of the famous towers in the world.

Bells early summoned soldiers to arms, as well as Christians to church. They sounded the alarm in fire or tumult; and the rights of the burghers in their bells were jealously guarded. Thus the chief bell in the cathedral often belonged to the town, not to the cathedral chapter. The curfew, the Carolus, and St. Mary's bell in the Antwerp tower all belong to the town; the rest are the property of the chapter. He who commanded the bell commanded the town; for by that sound, at a moment's notice, he could rally and concentrate his adherents. Many a bloody chapter in history has been rung in and out by bells.

On the third day of Easter 1282, at the ringing of the Sicilian vespers (which have given their name to the affair), 8,000 French were massacred in cold blood by John of Procida, who had thus planned to free Sicily from Charles of Anjou. On Aug. 24, St. Bartholomew's day, 1571, bells ushered in the massacre of the Huguenots in France, to the number, it is said, of 100,000. Bells have rung alike over slaughtered and ransomed cities; and far and wide throughout Europe in the hour of victory or irreparable loss. At the news of Nelson's triumph and death at Trafalgar, the bells of Chester rang a merry peal alternated with one deep toll, and similar incidents could be multiplied.

There are many old customs connected with the use of church bells, some of which have died out, while others remain here and there. The best known and perhaps oldest of these is the "Curfew" (*couvre-feu*), first enforced (though not perhaps introduced) by William the Conqueror in England as a signal for all lights and fires to be extinguished at 8 P.M.—probably to prevent nocturnal gatherings of disaffected subjects. In many towns it survived into the 19th century as a signal for closing shops at 8 or 9 P.M.; and it is still kept up in various places as an old custom.

Among secular uses connected with church bells are the "Mote" or "Common" bell, summoning to municipal or other meetings, as *e.g.*, the 7th at St. Mary's, Stamford, tolled for quarter sessions, or the bell at St. Mary's, Oxford, for meetings of Convocation. In some places one of the bells is known as the "Vestry Bell." The "Pancake Bell," still rung here and there on Shrove Tuesday, was originally a summons to confession before Lent; the "Harvest Bell" and "Seeding Bell" called labourers to their work; while the "Gleaning Bell" fixed the hours for beginning or leaving off gleaning, so that everyone might start fair and have an equal chance. The "Oven Bell" gave notice when the lord of the manor's oven was ready for his tenants to bake their bread; the "Market Bell" was a signal for selling to begin; and in some country districts a church bell is still rung at dinner time.

Other old customs are naturally connected with the ecclesiastical uses of bells. The "Passing Bell," rung for the dying, is now generally rung after death "Burial Peals," once common at or after funerals, to scare away the evil spirits from the soul of the departed, though discouraged by bishops as early as the 14th century, were kept alive by popular superstition, and only finally checked in Puritan times; but they have been revived, since the spread of change-ringing, in the "muffled peals" now frequently rung as a mark of respect to deceased persons of public or local importance. The "Sermon Bell," rung in pre-Reformation times to give notice that a sermon was to be preached (*cf.* Shakespeare, *Henry IV.*, pt. 2, iv. 2 4-7), survives in some places in a custom of ringing the tenor bell, before a service with a sermon; and a similar custom before a celebration of the Holy Communion preserves the memory of the "Sacrament Bell."

Large Bells.—There are a few bells of world-wide renown, and several others more or less celebrated. The great bell at Moscow, "Tsar Kolokol," which was cast in 1733, was in the earth 103 years and was raised by the emperor Nicholas in 1836. The present bell seems never to have been actually hung or rung, having been cracked in the furnace; and it now stands on a raised platform in the middle of a square. It weighs about 180 tons, height 10ft. 3in., circumference 60ft. 9in., thickness 2ft., weight of broken piece 11 tons. The second Moscow bell, the largest in

the world in actual use, weighs 128 tons. In a pagoda in Upper Burma hangs a bell 16ft. in diameter, weighing about 80 tons. The great bell at Peking weighs 53 tons; Nanking, 22 tons; Olmütz, 17 tons; Vienna (1711), 17 tons; Notre Dame (1680), 17 tons; Erfurt, 13 tons; Great Peter, York Minster, recast in 1927, 11 tons; Great Paul, at St. Paul's cathedral, 16½ tons; Great Tom at Oxford, 7½ tons; Great Tom at Lincoln, 5½ tons. Independence Hall bell, in Philadelphia, cast by Meneely in 1876, 6½ tons. Big Ben of the Westminster clock tower weighs 13½ tons; it was cast by George Mears under the direction of the first Lord Grimthorpe (E. Beckett Denison) in 1858, but is now cracked. Its four quarters were cast by Warner in 1856. The "Kaiserglocke" of Cologne cathedral, recast in 1875, with metal from French cannon captured in 1870-71, weighed 27½ tons, but was broken up during the World War and has since been replaced by a new bell weighing 25 tons. The 18½-ton bourdon bell of the carillon of 64 bells in Riverside church, New York (supplied by Messrs. Gillett and Johnston, of Croydon, England), is the biggest bell in the world that has ever been tuned and the largest bell which has so far been cast in England.

Bell-ringing.—The science and art of bell-ringing, as practised upon church and tower bells, falls under two main heads:—(1) Mechanical ringing, in connection with the machinery of a clock or "carillon"; (2) Ringing by hand, by means of ropes attached to the fittings of the bells, whereby the bell itself is either moved as it hangs mouth downwards sufficiently for the clapper just to touch its side (called, technically, "chiming"); or is swung round nearly full circle with its mouth uppermost (technically "ringing"), in which case the impact of the clapper is much heavier, and the sound produced is consequently louder and more far-reaching. Mechanical ringing is more common in America and on the Continent of Europe, especially in Belgium and Flanders; ringing by hand is more common in England, where the development of change-ringing (*see* below) has brought it into prominence.

(1) *Mechanical ringing* is effected by a system of wires connected with small hammers striking the bells, usually on the outside in the case of clocks and inside in the case of chimes and carillons, and worked either by connection with the machinery of a clock, so as to play tunes or artificially arranged chimes at definite intervals; or with a key-board containing handles. The first of these methods is familiar in the chimes (Cambridge, Westminster, etc.) heard from many towers at the striking of the hours and quarters; or in hymn tunes played at intervals (*e.g.*, of three hours) upon church bells. The second method is peculiar to the "carillon" (*qv*) as found everywhere in Belgium, where with a set of from 20 or 30 to 60 or 70 bells a much wider scope for tunes and harmonies is provided than in English belfries, where the numbers of bells usually range from four to twelve in one key only. There are about 40 rings of 12 bells in England, some hundreds of rings of ten, perhaps 2,000 rings of eight, with a total of, say, 10,000 ringing peals.

(2) *Ringling by Hand.*—Church bells may be "chimed" or "rung" (*see* above). One man can, as a rule, chime three bells, with a rope in each hand and one foot in the loop of another. Some prefer the quieter sound of chiming as an introduction to divine service, but where a band of ringers is available and change-ringing is practised, the bells as a rule are rung. The practice of "clocking" a bell, in which the clapper, by means of a cord attached to it and pulled from below, is allowed to swing against the bell at rest, is often employed to save trouble; but the jar is very likely to crack the bell. In ringing, or in true chiming, the bell is in motion when struck.

For ringing, a bell is pulled up and "set" mouth uppermost. She (to ringers a bell is feminine) is then pulled off, first at "handstroke" (*i.e.*, with the hands on the "sally" or tufted portion of the rope, a few feet from its lower end) and then at "back-stroke" in the reverse direction (with the hands nearer the lower end, the rope having at the previous pull coiled round three-quarters of the wheel's circumference), describing at each pull a full circle till she comes back to the upright position. At each revolution the swing is chiefly done by the weight of the bell,

the ringer giving a pull of just sufficient strength to bring the bell back into the upright position; otherwise its swing would become gradually shorter till it remained at rest mouth downwards.

(3) *Electric Ringing*.—A device recently marketed by the Meneely Bell Company of Troy, N.Y., enables the ringer to play tunes and changes on chimes (carillons) of stationary bells from a console having keys like those of an organ. Wires lead from the console to relays, located near the bells, and wires from the relays are run to solenoids (large magnets) which are connected to the clappers. Pressure on the keys transmits the electricity to the solenoids which pull the clappers. Quick playing is thus secured, repeat blows at the rate of three per second being possible on any one bell. Nearly all American made chimes are now being designed for electric ringing.

Change-ringing.—When a given number of bells are rung over and over again in the same order, from the highest note, or "treble" to the lowest, or "tenor"—1, 2, 3, 4, 5, 6, 7, 8—they are said to be rung in "rounds." "Changes" are variations of this order—e.g., 2 1 3 5 4 7 6 8, 2 3 1 4 5 6 7 8; and "change-ringing" is the art of ringing bells in "changes" so that a different "change" or rearrangement of order is produced at each pull of the bell-ropes, until, without any repetition of the same change, the bells come back into "rounds."

The general principle of all methods of change-ringing is that each bell, after striking in the first place or "lead," works gradually "up" to the last place or "behind," and "down" again to the first, and that no bell ever shifts more than one place in each change. Thus the ringer of any bell knows that whatever his position in one change, his place in the next will be either the same, or the place before or the place after. He does not have to learn by heart the different changes or variations of order; nor need he, unless he is the "conductor," know the exact order of any one change. He has to bear in mind, first, which way his bell is working, viz., whether "up" from the first to last place, or "down" from last to first; secondly, in what place his bell is striking; thirdly, what bell or bells are striking immediately before or after him—this being ascertained chiefly by "rope-sight," i.e., the knack, acquired by practice, of seeing which rope is being pulled immediately before and after his own. He must also remember and apply the rules of the particular "method" which is being rung.

The following table representing the first 20 changes of a "plain course" of "Grandsire Triples" (for these terms, see below) illustrates the subject-matter of this section:

1 2 3 4 5 6 7 "Rounds."	7 5 6 1 4 2 3 (10th change.)
2 1 3 5 4 7 6 (1st change.)	5 7 1 6 2 4 3
2 3 1 4 5 6 7	5 1 7 2 6 3 4
3 2 4 1 6 5 7	1 5 2 7 3 6 4
3 4 2 6 1 7 5	1 2 5 3 7 4 6
4 3 6 2 7 1 5 (5th change.)	2 1 5 7 3 6 4 (15th change.)
4 6 3 7 2 5 1	2 5 1 3 7 4 6
6 4 7 3 5 2 1	5 2 3 1 4 7 6
6 7 4 5 3 1 2	5 3 2 4 1 6 7
7 6 5 4 1 3 2	3 5 4 2 6 1 7
	3 4 5 6 2 7 1 (20th change.)

It will be observed that at the 1st change the third bell and at the 15th the fifth bell, according to the rule of this "method," strikes a second blow in the third place ("makes third's place"). This stops the regular work of the bells which at the previous change were in the 4th, 5th, 6th and 7th places ("in 4, 5, 6, 7"), causing them to take a step backwards in their course, "up" or "down," or as it is technically called, to "dodge." Were it not for this the bells would come back into "rounds" at the 14th change. It is by the use of "place-making" and "dodging," according to the rules of various "methods," that the required number of changes, upon any number of bells, can be produced. But in order that this may be done, without the bells coming back into "rounds," further modifications of the "coursing order," called technically "Bobs" and "Singles," must be introduced. In ringing, notice of these alterations as they occur is given by one of the ringers, who acts as "conductor," calling out "Bob" or "Single" at the right moment to warn the ringers of certain bells to make the requisite alteration in the regular work of their bells. Hence, in ringing language, to "call" a peal or touch—to conduct it.

The number of possible "changes" on any given series of bells

may be ascertained, according to the mathematical formula of permutations, by multiplying the number of the bells together. Thus on three bells, only six changes or variations of order ($1 \times 2 \times 3$) can be produced; on four bells, $1 \times 2 \times 3 \times 4 = 24$; and so on up to the immense figure of 479,001,600 changes obtainable upon 12 bells. As many as 21,000 changes, occupying over 12 hours, have been rung upon church bells. But the great physical strain upon the ringers—to say nothing of the effect upon those who are within hearing—makes such performances exceptional. The word "peal" is often, though incorrectly, used (1) for a set of church bells ("a peal of six," "a peal of eight"), for which the correct term is "a ring" of bells; (2) for any shorter performance than a full peal (e.g., "wedding-peal," "muffled peal," etc.), called in ringing language a "touch."

Varying "Methods."—Change-ringing upon five bells is called "Doubles," upon seven bells "Triples," upon nine "Caters" (Fr *quatre*), and upon 11 "Cinques," from the fact that at each change two, three, four or five pairs of bells change places with each other. "Doubles" can be and are rung when there are only five bells; but as a rule these "odd-bell" systems are rung with a "tenor behind," i.e., struck at the end of each change; the number of bells in a tower being usually an even number—six, eight, ten or 12. In "even-bell" systems the tenor is "rung in" or "turned in," i.e., changes with the other bells, and a different terminology is employed; change-ringing on six bells being called "Minor"; on eight bells, "Major"; on ten bells, "Royal"; and on 12, "Maximus."

As regards the application of the term "tenor," rather than "bass," to the largest bell in a peal, no satisfactory explanation has ever been offered—unless the suggestion can be so described that in a peal of ten the biggest bell is the "tenth" or "tenor!"

The principal "methods" of change-ringing, each of which has its special rules, are: (1) "Grandsire"; (2) "Plain Bob"; (3) "Treble Bob"; (4) "Stedman," from the name of its inventor, Fabian Stedman, about 1670. In "Grandsire" the treble and one other bell, in "Plain Bob" the treble alone, has a "plain hunt," i.e., works from the first place, or "lead," to the last place, or "behind," and back again, without any dodging; in "Treble Bob" the treble has a uniform but zigzag course, dodging in each place on its way up and down. This is called a "Treble Bob hunt"; and under these two heads, according to the work of the treble, are classified a variety of "plain methods" and "Treble Bob methods," among the latter being the so-called "Surprise" methods, the most complicated and difficult of all. "Stedman's principle," which is *sui generis*, consists in the three front bells ringing their six possible changes, while the remaining pair or pairs of bells dodge. It is thus an "odd-bell" method adapted to five, seven, nine or 11 bells; as also is "Grandsire," though occasionally rung on even numbers of bells. "Treble Bob" is always, and "Plain Bob" generally, rung on even numbers—six, eight, ten or 12.

Quite distinct from the art of change-ringing is the science of "composing," i.e., arranging and uniting by the proper "calls," subject to certain fixed laws and conditions, a number of groups of changes, so that no one change, or series of changes represented in those groups, shall be repeated. A composition, long or short, is said to be "true" if it is free from, "false" if it involves, such repetition; and the body of ascertained laws and conditions governing true composition in any method constitutes the test or "proof" to be applied to a composition in that method to demonstrate its truth or falseness. One of the objects kept in view by composers is musical effect. Certain sequences of contrasts of notes strike the ear as more musical than others; and an arrangement which brings up the more musical changes in quicker succession improves the musical effect of the "peal" or "touch." On seven bells all the possible changes must be inserted in a true peal, but on larger numbers of bells, where the choice is from an immense number of possible changes, the composer is free to select those which are most musical.

An Ancient Art.—The art of scientific change-ringing, originally peculiar to England and to-day practised outside England only in a few places in Canada, Australia, South Africa and the United States, does not seem to have been evolved before the

middle of the 17th century. Societies or guilds of ringers, however, existed much earlier. A patent roll of 39 Henry III. (1255) confirms the "Brethren of the Guild of Westminster, who are appointed to ring the great bells there," in the enjoyment of the "privileges and free customs which they have enjoyed from the time of Edward the Confessor." In 1602 (as appears from a ms. in the library of All Souls' college, Oxford) was founded a society called the "Scholars of Cheapside." In 1637 began the "Ancient Society of College Youths," so called from their meeting to practise on the six bells at St. Martin's, College hill, a church destroyed in the Great Fire of London, 1666. At first only "rounds" and "call-changes" were rung, till about 1642, when 120 "Bob Doubles" were achieved; but slow progress was made till 1677, when Fabian Stedman of Cambridge published his *Campanologia*, dedicating it to this society, his method being first rung about this time by some of its members.

Before the end of the 17th century was founded the "Society of London Scholars," the name of which was changed in 1746 to "Cumberland Youths" in compliment to the victor of Culloden. These two metropolitan societies still exist, and include in their membership most of the leading change-ringers of England; one of the oldest provincial societies being that of Saffron Walden in Essex, founded in 1623, and still holding an annual ringing festival. In the latter half of the 18th and first half of the 19th century change-ringing, which at first seems to have been an aristocratic pastime, degenerated in social repute. Church bells and their ringers, neglected by church authorities, became associated with the lower and least reputable phases of parochial life; and the belfry was too often an adjunct to the pothouse.

In the last half of the 19th century, however, there was a great revival of change-ringing, leading to improvements in belfries and in ringers, and to their gradual recognition as church workers. Diocesan or county associations for the promotion of change-ringing and of belfry reform spread knowledge of the art and aroused church officials to greater interest in and care for their bells. A central council of church bell ringers, consisting of delegates from these various societies, was also formed, and in the result, it is now less likely than ever that the Belgian carillons will be preferred in England to the peculiarly English system of ringing bells in peal; by which, whatever its difficulties, the musical sound of bells is most fully brought out, and their scientific construction best stimulated.

Bell Literature.—The early literature of bell-lore (or campanology) consists chiefly of scattered treatises or pamphlets upon the technique of different methods of change-ringing, or upon the bells of particular counties or districts. Two of the earliest are *Campanologia or the Art of Ringing Improved* (1677), and a chapter of "Advice to a Ringer" in the *School of Recreations, or Gentleman's Tutor* (1684), showing that in its early days bell-ringing was a fashionable pastime. The revival of change-ringing in recent years has produced many manuals, while *A Glossary of Technical Terms* used in connection with church bells and change-ringing was published in 1901, under the auspices of the Central Council of Church Bell Ringers. On the history of church bells and customs connected with them much curious information is given in North's *English Bells and Bell Lore* (1888). By the same author are monographs on the church bells of Leicestershire, Northamptonshire, Lincolnshire and Hertfordshire. There are similar works on the church bells of Suffolk and Cambridgeshire, by Dr. Raven; of Huntingdonshire, by the Rev. T. M. N. Owen; and on the church bells of Essex, by the Rev. C. Deedes. A compilation and summary of many data of bell-lore will be found in *A Book about Bells*, by the Rev. G. S. Tyack; and in a volume by Dr. Raven in the "Antiquary's Books" series (1906), entitled *The Bells of England*, which deals with the antiquarian side of bell-lore. Further may be mentioned *An Account of Church Bells* (Lukis); *The Church Bells of England* (Walters); *Clocks, Watches and Bells* (Lord Grimthorpe); and *Bells and Bell Tones*, a lecture delivered at the Musical Association by W. W. Starmer. (See also CARILLON.)

House Bells.—Ordinary house bells of the old type, with a clapper worked by a wire, require no description. In pneumatic

bells the wires are replaced by pipes of narrow bore, and the current of air which is caused to flow along these by the pressing of a push-button actuates a small hammer which impinges rapidly against a bell or gong. An electric bell consists of a small electro-magnet acting on a soft iron armature, which is supported in such a way that, normally, it stands away from the magnet. When the latter is energized by the passage of an electric current, the armature is attracted towards it, and a small hammer attached to it strikes a blow on the bell or gong. This "single stroke" type of bell is largely used in railway signalling instruments. For domestic purposes, however, the bells are arranged so that the hammer strikes a series of strokes, continuing so long as the push-button which closes the electric circuit is pressed. A light spring is provided against which the armature rests when it is not attracted by the electro-magnet, and the current is arranged to pass through this spring and the armature on its way to the magnet. When the armature is attracted by the magnet it breaks contact with this spring, the current is interrupted and the magnet being no longer energized allows the armature to fall back on the spring and thus restore the circuit. In this way a rapid to and fro motion is imparted to the hammer. The electric current is supplied by a battery and conveyed by a wire. Bells of this kind cease to ring whenever the electrical continuity is interrupted, but in some cases, as in connection with burglar-alarms, it is desirable that the bell, once set in action, shall continue to ring even though the wires are cut. For this purpose, in "continuous ringing" bells, the current, started by the push or alarm apparatus, instead of working the bell, is made to operate a relay-switch and thus to bring into circuit a second battery which continues to ring the bell, no matter what happens to the first circuit.

BELL, BOOK AND CANDLE, an old ceremony of pronouncing the "major excommunication" or "anathema." Its origins are not clear, but it goes back certainly to the end of the 9th century, if not to the middle of the 8th. In this formality the bell represents the public character of the act, for it served not only to call the participants together but to announce it to all; the ceremony was performed in some conspicuous place and, upon its termination, letters were written to bishops of other sees to report the fact. The book represents the authority of the words spoken by the presiding bishop. The candle is believed to symbolize the possibility that the ban may be lifted by the repentance and amendment of its victim, for just as the candles used are extinguished, so the excommunication itself may be. When the assemblage has been convoked a bishop appears with 12 priests; and all of the 13 hold lighted candles. The bishop, wearing violet vestments, then recites the formula, ending thus: "We separate him, together with his accomplices and abettors, from the precious body and blood of the Lord and from the society of all Christians; we exclude him from our holy mother the Church in heaven and on earth; we declare him excommunicate and anathema; we judge him damned, with the Devil and his angels and all the reprobate, to eternal fire until he shall recover himself from the toils of the Devil and return to amendment and to penitence." Those present answer, "So be it!" Then the bishop and the 12 priests extinguish their candles by dashing them to the ground and (as a general rule) the ceremony is ended. Sometimes the 108th psalm has been recited as a reference to Judas and other enemies of Christ.

The present ceremonial of excommunication is to be found in the *Pontificale Romanum*, book iii., under the title *Ordo excommunicandi et absolvendi*. See also Catalan, *Pontificale romanum prolegomenis et commentariis illustratum*, vol. iii., 253 et seq. (2nd ed., Paris, 1852); Martène, *De antiquae Ecclesiae Ritibus*, book iii., ch. iv. (Rouen, 1700); Vacant et Mangenot, *Dictionnaire de Théologie catholique*, vol. i., coll. 1168-71.

BELLABELLA, the common name (popularized from the Indian corruption of Milbank) for a tribe of Kwakiutl Indians at Milbank, British Columbia, including the subtribes Kokaik, Oetlilk and Oealilk. They were converted to Christianity by Protestant missionaries, and number about 300.

BELLACOOA, an American Indian ethnic unit, also called Tallion, constituting the northernmost group of the Salishan family, of the Coast division. They lived in a number of inde-

BELLS AND CARILLONS IN MANY PARTS OF THE WORLD

- 1 Bell in the Ta Chung Su temple two miles northeast of Pekin, China. one of the largest hanging bells in the world. It is 17 ft. high, 34 ft. in circumference, 9 in. thick at the rim and weighs 53 tons. It was cast in 1409 for the Emperor Yung Lo
- 2 Carillon of 53 bells in the Ottawa parliament buildings. The weight of the bass bell seen in the left foreground, is 10 tons, and there are 47 treble and middle register bells
- 3 The "bourdon" for the Laura Spelman Rockefeller Memorial carillon, Riverside church, New York city. said to be the largest bell ever cast in England, having a net weight of 18 tons 5 cwt. 1 qr. 18 lb after tuning
- 4 The "king of bells" at the Kremlin, Moscow, weighing approximately 180 tons; height 19 ft. 3 in., circumference 60 ft. 9 in., greatest thickness 24 inches. It was cast in the year 1733 and added to the Ivanovskaya belfry in 1737. A fragment was broken from it soon after it was hung rendering it unfit for service and leaving an aperture 7 ft. 2 1/2 in. from top to bottom
- 5 Carillon machinery which operates the bells at Manchester Town Hall, England. Keyboards on the Continental order have been introduced
- 6 A Chinese bell in Beaconhill park, Victoria, brought from a sacred palace in Pekin at the time of the Boxer rebellion. It was cast in 1627 and weighs 2000 pounds

pendent villages on Bentinck and Dean inlets and Bellacoola river in British Columbia. They adhered to the maritime culture restricted to the Northwest Coast. By 1902 their numbers had shrunk to 300. See F. Boas, in various writings on the area; and a monograph in press, *Can. Div. Ethn.*, by T. F. McIlwraith.

BELLADONNA, in botany, a name for the deadly nightshade (*Atropa belladonna*). (See **ATROPINE**; **NIGHTSHADE**.) The belladonna lily is quite a different plant. (See **AMARYLLIS**.)

BELLAGIO, a village of Lombardy, Italy, province of Como, 15m. N.N.E. by steamer from Como. It is a resort with fine gardens on the promontory between the two southern arms of the lake. It works in silk and olive-wood.

BELLAIRE, a city of Belmont county, O., U.S.A., on the Ohio river, 5m. below Wheeling. It is served by the Baltimore and Ohio and the Pennsylvania railways. The population was 9,912 in 1900; 15,061 in 1920, of whom 2,691 were foreign-born white; and was estimated at 16,258 in 1925. It is the outlet for the Belmont county coal-field, and the shipping point for fine Jersey cows raised in the vicinity. Iron, limestone and fire-clay, found near, are utilized in the manufacture of galvanized and enamelled ware, agricultural implements, iron and steel, stoves, glass, rivets, and other commodities. The village was settled about 1795, incorporated in 1858, and chartered as a city in 1874.

BELLAMY, EDWARD (1850-1898), American author and social reformer, was born at Chicopee Falls (Mass.), March 25, 1850, and died there May 22, 1898. He studied at Union College, Schenectady, New York, and in Germany; was admitted to the bar in 1871, but soon became associate editor of the Springfield (Mass.) *Union* and then an editorial writer for the New York *Evening Post*. Although his first books were light fiction, such as *Dr. Heidenhoff's Process* (1880) and *Miss Ludington's Sister* (1884), his historical novel *The Duke of Stockbridge* (1900), with its sympathy for unfortunate debtors and the leaders of Shays' rebellion, showed the direction in which he was tending. By the time it was completed, he refused to allow it to be published by the local newspaper to which it was promised, expending all of his energy instead on social and economic reform. *Looking Backward, 2000-1887* (1888), the most popular of the American Utopian romances, was translated into several languages and has preserved his name until a day when many of the inventions he prophesied have become realities. Its sequel *Equality* (1897) and his attempts as writer, lecturer and politician to promote his communistic theories under the title of "Nationalism" are, however, almost forgotten.

BELLAMY, GEORGE ANNE (1727-1788), English actress, born at Fingal, Ireland, by her own account, on April 23, 1733, but more probably in 1727; the illegitimate daughter of Lord Tyrawley. On his appointment as ambassador to Russia, she went to live with her mother in London, made the acquaintance of Mrs. Woffington and Garrick, and adopted the theatrical profession. Her first engagement was at Covent Garden as Monimia in the *Orphan* in 1744. Her success was immediate, and till 1770 she acted in London, Edinburgh and Dublin, in all the principal tragic rôles. She played Juliet to Garrick's Romeo at Drury Lane at the time that Spranger Barry (*q.v.*) was giving the rival performances at Covent Garden, and was considered the better of the Juliets. Her last years were passed in poverty and ill-health. She died on Feb. 16, 1788. Her *Apology* (6 vols., 1785) gives an account of her long career and of her private life, the extravagance and licence of which were notorious. She was named George Anne by mistake for Georgiana.

BELLAMY, JOSEPH (1719-1790), American theologian, was born in Cheshire (Conn.) Feb. 20, 1719. He graduated from Yale in 1735, was licensed to preach when scarcely 18 years old, and from 1740 until his death, March 6, 1790, was pastor of the Congregational church at Bethlehem (Conn.). The publication of *True Religion Delineated* (1750), won for him a high reputation. His influence on the religious thought of his time in America was probably surpassed only by that of his old friend and teacher, Jonathan Edwards. His published works include *The Wisdom of God in the Permission of Sin* (1758), his most characteristic work; *Theron, Paulinus and Aspasio* (1759); *The Nature and*

Glory of the Gospel (1762); *A Blow at the Root of Antinomianism* (1763); and *There is but One Covenant* (1769).

His collected *Works* were published in 3 vol. (1811-12), and were republished with a *Memoir* by Rev. Tryon Edwards (2 vol., 1850).

BELLARMINE (Ital. **BELLARMINO**), **ROBERTO FRANCESCO ROMOLO** (1542-1621), Italian cardinal and theologian, was born in Monte Pulciano, Tuscany, on Oct. 4, 1542. He entered the Society of Jesus in 1560. After three years at Rome he was sent to the Jesuit settlement at Mondovi in Piedmont; in 1567 and 1568 he was at Padua, studying theology under a master who belonged to the school of St. Thomas Aquinas. In 1569 he was sent to Louvain, and in 1570, after being ordained priest, began to lecture on theology there. His seven years' residence in the Low Countries brought him into relations with modes of thought differing from his own; and, though neither by temperament nor training inclined to the prevailing Augustinian doctrines of grace and free will, the current controversy compelled him to define his theological principles more clearly. On his return to Rome in 1576 he was chosen by Gregory XIII. to lecture on controversial theology in the new Roman college. The result appeared in the far-famed *Disputationes de Controversiis Christianae Fidei adversus huius temporis Haereticos* (3 vols., 1581, 1582, 1593), which called forth a multitude of answers on the Protestant side; the book exhausts the controversy as it was carried on in those days, and contains a lucid and uncompromising statement of Catholic doctrine. Bellarmine took part in the preparation of the Clementine edition (1592) of the Vulgate. He has been accused in this matter of some disingenuousness in regard to the concealment of numerous errors in the earlier edition, that of Sixtus; it appears, however, that, though he wished to spare that pope from censure, he did not conceal the inaccuracies of the edition or suggest that they were merely misprints. He was made cardinal in 1599 by Clement VIII., and two years later archbishop of Capua. He resigned his archbishopric in 1605. When health failed he retired to Monte Pulciano, where from 1607 to 1611 he acted as bishop. In 1610 he published his *De Potestate summi Pontificis in rebus temporalibus* against the posthumous work of William Barclay of Aberdeen, which denied the temporal power of the pope. Bellarmine trod here on difficult ground, for, although maintaining that the pope had the indirect right to depose unworthy rulers, he gave offence to Paul V. in not asserting more strongly the direct papal claim, whilst many French theologians, and especially Bossuet, condemned him for his defence of ultramontanism.

As a *consultor* of the Holy Office, Bellarmine took a prominent part in the first examination of Galileo's writings. He had followed with interest Galileo's scientific discoveries, and a respectful admiration grew up between them. Bellarmine did not proscribe the Copernican system, as has been maintained by Reusch (*Der Process Galileo's und die Jesuiten*, Bonn, 1879, p. 125); all he claimed was that it should be presented merely as an hypothesis, until it should receive scientific demonstration. When Galileo visited Rome in Dec. 1615 he was warmly received by Bellarmine, and the high regard in which he was held is clearly testified in Bellarmine's letters and in Galileo's dedication to the cardinal of his discourse on "flying bodies." He died in Rome on Sept. 17, 1621.

Bellarmino, whose life was a model of Christian virtue, is one of the greatest of Catholic controversialists; he has suffered the common fate of controversialists in that his methods of controversy and his achievements in it have been, and still are, the subject of acute controversy. His devotional treatises were very popular among English Catholics in the penal days. Bellarmine was beatified by Pius XI. on May 13, 1923, and his feast is kept on May 13 in Jesuit churches.

BIBLIOGRAPHY.—Of the older editions of Bellarmine's complete works the best is that in 7 vols. published at Cologne (1617-20); modern editions appeared in 8 vols. at Naples (1856-62, reprinted 1872), and in 12 vols. at Paris (1870-74). For complete bibliography of all works of Bellarmine, of translations and controversial writings against him, see C. Sommervogel, *Bibliothèque de la Compagnie de Jésus*, vol. i. cols. 1151-1254 (Brussels and Paris, 1890 et seq.); *id.*, *Addenda*, pp. x.-xi. vol. viii, cols. 1797-1807. The main source for the life of Bellarmine is his Latin *Autobiography* (Rome, 1675; Louvain, 1753), which was reprinted with original text and

German translation by Döllinger and Reusch, *Die Selbstbiographie des Cardinals Bellarmin* (Bonn, 1887). The *Epistolae Familiares*, a very incomplete collection of letters, was published by J. Fulgatti (Rome, 1650), who is also the author of *Vita del cardinale Bellarmino della Compagnia di Gesù* (Rome, 1624). The best modern studies are J. B. Couderc's *Le Vénérable Cardinal Bellarmin* (2 vols., Paris, 1893); X. le Bachelet's article in A. Vacant's *Dict. de théol. cat.*, cols. 560-599, with exhaustive bibliography; J. Bzodrick, *The Life and Work of Blessed Robert Francis, Cardinal Bellarmine, S.J.* (1928).

BELLARY or **BALLARI**, a city and district of British India, in the Madras presidency. The city is 305m. by rail from Madras. Pop. (over 58,000 in 1901) fell below 35,000 in 1911, owing to plague, and was 39,842 in 1921. The fort rises from a huge mass of granite rock, which, with a circumference of nearly 2m., juts up abruptly to a height of 450ft. above the plain. To the east and south lies an irregular heap of boulders, but to the west is an unbroken precipice, and the north is walled by bare rugged ridges. It is defended by two distinct lines of works. The upper fort is a quadrangular building on the summit, with only one approach, and was deemed impregnable by the Mysore princes. It contains several cisterns, excavated in the rock. The lower fort, with barracks, church, etc., and many private houses, lies at the eastern base of the rock and measures about half-a-mile in diameter. The fort of Bellary was originally built by Hanumapa in the 16th century. It was first dependent on the kingdom of Vijayanagar, afterwards on Bijapur, and subsequently subject to the nizam and Hyder Ali. The latter erected the present fortifications, according to tradition, with the assistance of a French engineer in his service, whom he afterwards hanged for not building the fort on a higher rock adjacent to it. Bellary is a temporary military station. There is a considerable trade in cotton, in connection with which there are large steam presses, and some manufacture of cotton cloth. There are a cotton spinning mill, distilleries and a sugar factory.

The district of Bellary has an area of 5,713 sq. miles. It consists chiefly of an extensive plateau between the eastern and western Ghats, of a height varying from 800-1,000ft. above the sea. The highest tracts are on the west, where the surface rises towards the culminating range of hills, and on the south, where it rises to the elevated tableland of Mysore. Towards the centre the almost treeless plain presents a monotonous aspect, broken only by a few rocky elevations that rise abruptly from the black soil. The district is watered by five rivers: the Tungabhadra, formed by the junction of two streams, Tunga and Bhadra, the Haggari, Hindri, Chitravati and Pennar, the last considered sacred by the natives. None of the rivers is navigable and all are fordable during the dry season. The climate of Bellary is extremely dry, and it has a smaller rainfall than any other district in south India. Bellary is subject to disastrous storms and hurricanes, and to famines. Pop. (1921) 862,372. The principal crops are millet, other food-grains, pulse, ground-nuts and cotton. There are considerable manufactures of cotton and woollen goods, and cotton is largely exported. The district is traversed by the Madras and Southern Mahratta railways, meeting on the eastern border at Guntakal junction, where another line branches off to connect with Bezwada.

Little is known of the early history of the district. It contains the ruined capital of the ancient Hindu kingdom of Vijayanagar, and on the overthrow of that State by the Mohammedans in 1564 the tract now forming the district of Bellary was split up into a number of military holdings. Between 1635 and 1800 the Carnatic was held by the Bijapur rulers, by the Mahrattas, by the great Mogul's viceroy, by Hyder Ali of Mysore and by the nizam of Hyderabad. The latter ceded it to the British in 1800 in return for protection by a force of British troops to be stationed at his capital. In 1808 the "Ceded Districts," as they were called, were split into two districts, Cuddapah and Bellary. In 1882 the district of Anantapur was formed into a separate collectorate.

BELL-BIRD, the name of a species of the genus *Chasmorhynchus* and especially of *C. nivosus*, the male of which carries a long, fleshy, erectile appendage ornamented with short white feathers on the forehead. The name is derived from the note. *C. tricarunculatus* carries three wattles, one at each angle, and

one at the base, of the beak. The bell-birds belong to the tropical American family *Cotingidae*.

BELL BOY, sometimes called bell hop, in the United States one who attends to the general needs of a hotel guest. Most hotels prefer to hire bell boys over 18 years old, in order to avoid legal restrictions incumbent upon the employment of minors. Some managers, however, employ young boys as pages, and train them for permanent service. City hotels, inasmuch as their summers are usually dull, are often willing to take on the migratory type of boys who move with the seasons from city to resort and back again. College students often act as bell boys in summer resorts.

BELL-COT, **BELL-GABLE** or **BELL-TURRET**, a structure, not a tower, in which bells are hung. It occurs in the form of a gable rising from a main wall, a dormer in a sloping

VARIOUS EXAMPLES SHOWING THE TREATMENT AS A SMALL TOWER (ST. BENOIT); BUTTRESS PINNACLE (FROISSY); PIERCED WALL SECTION

roof or a miniature tower or turret at the corner of a building. A favourite position is at the top of the main west gable of a church. Occasionally, even when a tower is present, a small bell, known as the "sanctus bell," will be hung in a bell-cot near the eastern end of the church. The bell-cot for this bell is often at the centre of the crossing of nave and transepts and elaborated into a flèche (*q.v.*). In Renaissance churches, particularly in Spain and the Spanish colonies, the bell-cot is frequently a large section of wall, often separated from any building, and pierced with arches in each of which a bell is hung.

BELLE ALLIANCE, LA, the name of a farm occupied by the centre of the French army at the battle of Waterloo (*see* WATERLOO CAMPAIGN); and also the name used by the Prussians for the battle itself.

BELLEAU, RÉMY (c. 1527-1577), French poet, and member of the Pléiade (*see* DAURAT), was born at Nogent-le-Rotrou. He studied with Ronsard and others under Jean Daurat at the Collège de Coqueret. He was attached to René de Lorraine, marquis d'Elboeuf, in the expedition against Naples in 1557, where he did good military service. Belleau was an enthusiast for the new learning and joined the group of young poets with ardour. In 1556 he published the first translation of Anacreon which had appeared in French. In the next year he published his first collection of poems, the *Petites inventions* in which he describes stones, insects, and flowers. The *Amours et nouveaux échanges des pierres précieuses* . . . (1576) contains perhaps his most characteristic work. Its title is quoted in Ronsard's epitaph on his tomb;

*Luy mesme a basti son tombeau
Dedans ses Pierres Précieuses,*

He wrote commentaries to Ronsard's *Amours* in 1560, notes which evinced delicate taste and prodigious learning. Like Ronsard and Joachim Du Bellay, he was extremely deaf. His days passed peacefully in the midst of his books and friends. His most considerable work is *La Bergerie* (1565-72), a pastoral in prose and verse written in imitation of Sannazaro. The lines on April in the *Bergerie* are well known to all readers of French poetry. Belleau was the French Herrick, full of picturesqueness, warmth, and colour. Extremely popular in his own age, he shared the fate of his friends and was undeservedly forgotten in the next. Regnier said: "Belleau ne parle pas comme on parle à la ville"; and his lyrical beauty was lost on the trim 17th century. Belleau's other works include a comedy entitled *La Reconnaissance*, in short rhymed lines, which is not without humour and life, and a comic masterpiece, a macaronic poem on the religious wars, *Dictamen metricum de bello huguenotico et reistorum piglamine ad sodales*.

The *Oeuvres complètes* (1867) of Rémy Belleau were edited by A. Gouverneur; and his *Oeuvres poétiques* (1879) by M. Ch. Marty-Laveaux in his *Pléiade française*; see also C. A. Sainte-Beuve, *Tableau historique et critique de la poésie française au XVI^e siècle* (ed. 1876).

BELLEAU WOOD, a tract of forest land, in area less than a square mile, 5m. N.W. of Château-Thierry, and 42m. E. of Paris, notable for the second clash between U.S.A. and German troops in the World War. When the German offensive of May 27, 1918, was launched on the Aisne, the 2nd Division of the American Expeditionary Force under Gen. Bundy was rushed to the assistance of the French VI. Army and deployed across the Paris-Château-Thierry road west of the latter town. On its front lay Belleau wood and the villages of Torcy, Boursches and Vaux, all occupied by the enemy. The Germans had been halted at Château-Thierry but were consolidating themselves at Vaux and in Belleau wood in preparation for a renewed advance west of Château-Thierry. The task of dislodging them was entrusted to the marine corps brigade under Gen. Harbord.

The attack was made on June 6, and the woods were penetrated but could not be held. The ground was extremely difficult, almost impenetrable underbrush covering a rugged outcrop of rock. Three days later the attack was renewed. The fighting was bitter, but, after a struggle lasting over a fortnight, the woods were finally taken by the 2nd Division; Boursches and Vaux were also captured, and the German advance—at a most dangerous point—was effectively blocked. In this engagement the Germans lost 24 guns and 1,654 prisoners, but the United States losses were severe, amounting to 285 officers and 7,585 men killed, wounded and missing. The battleground was in 1923 dedicated as a permanent memorial to the United States officers and men who lost their lives there, and the French Government ordered the name to be changed to that of Bois de la Brigade de Marine. (See *SOISSON-RHEIMS* and *WORLD WAR*.)

BELLECOUR (1725-1778), French actor, whose real name was JEAN CLAUDE GILLES COLSON, was born on Jan. 16 1725, the son of a portrait painter. After playing in the provinces he made his début, on Dec. 21 1750, as Achilles in *Iphigénie*. He was more successful, however, in comedy parts. He wrote a successful play, *Fausse apparence* (1761), and was very useful to the Comédie Française in editing and adapting the plays of others. He died on Nov. 19 1778.

His wife, ROSE PERRINE LE ROY DE LA CORBINAYE, was born at Lamballe on Dec. 20 1730, the daughter of an artillery officer. Under the name of Beauménard she made her first Paris appearance in 1743 as Gogo in Favart's *Le Coq du village*. After a year at the Opéra Comique she played in several companies, including that of Marshal Saxe. In 1749 she made her début at the Comédie Française as Dorine in *Tartuffe*, and her success was immediate. She retired in 1756, but reappeared in 1761 as Madame Bellecour, and continued her successes in soubrette parts in the plays of Molière and de Regnard. She retired at the age of sixty, but the Revolution put an end to her pension, and she died in poverty on Aug. 5 1799.

BELLEFONTAINE, a city of Ohio, U.S.A., on a hill 1,550ft. above sea-level, 45m. N.W. of Columbus; the county seat of Logan county. It is served by the Big Four and the New York

Central railways. The population in 1920 was 9,336. It has large railway car shops, and its manufactures include bridges, automobile bodies, sewer pipes and mattresses. The town was settled about 1818 and incorporated in 1835. Several springs of clear water in the vicinity suggested its name.

BELLEGARDE, HEINRICH JOSEPH JOHANNES, COUNT VON (1756-1845), Austrian soldier and statesman, was born at Dresden on Aug. 29, 1756, and for a short time served in the Saxon army. Transferring his services to Austria in 1771 he earned distinction in the Turkish War of 1788-89 and the Netherlands campaigns of 1793-04, and in the campaign of 1706 in Germany, on the staff of the archduke Charles, whom he accompanied to Italy in the following year. In 1799 he commanded a corps in eastern Switzerland, connecting the armies of the archduke and Suvarov, and finally joined the latter in north Italy. He conducted the siege of the citadel of Alessandria, and was present at the decisive battle of Novi. He served again in the latter part of the Marengo campaign of 1800 in the rank of general of cavalry. In 1805, when the archduke Charles left to take command in Italy, Bellegarde became president *ad interim* of the council of war. He was soon employed, however, in the field, and at the sanguinary battle of Caldiero he commanded the Austrian right. In the war of 1800 he commanded the extreme right wing of the main army (see *NAPOLEONIC CAMPAIGNS*). Cut off from Charles as the result of the battle of Eckmühl, he retreated into Bohemia, but managed to rejoin before the great battles near Vienna (Aspern and Wagram). From 1800-13 Bellegarde, now field marshal, was governor-general of Galicia, but was often called to preside over the meetings of the Aulic Council (*q v*), especially in 1810 in connection with the reorganization of the Austrian army. In 1813-14-15 he led the Austrian armies in Italy. His successes in these campaigns were diplomatic as well as military, and he ended them by crushing the last attempt of Murat in 1815. From 1816-25 (when he had to retire owing to failing eyesight) he held various distinguished civil and military posts. He died in 1845.

See K. von Smola *Das Leben des F. M. von Bellegarde* (1847).

BELLE-ÎLE-EN-MER, an island off the west coast of France, department of Morbihan, 8m. S by W of the peninsula of Quiberon. Pop. (1926) 6,773. Area, 33sq.m. The island has four communes, Le Palais, Bangor, Sauzon and Locmaria. It forms a treeless plateau with an average height of 130ft above sea-level, largely covered with moors and bordered by a rugged and broken coast. The climate is mild, the fig-tree and myrtle growing in sheltered spots and the soil, where cultivated, is productive. Numerous megalithic monuments suggest its importance (together with the adjoining mainland) as a centre of coastwise intercourse in the early days of metal. It was known to the Romans as *Vindalis*, corrupted in the middle ages to Guedel. In 1572 the abbey of Ste. Croix at Quimperlé ceded the island to the Retz family, and it became a marquise in the following year. Subsequently it passed to the family of Fouquet, and finally to the Crown in 1718. It was held by English troops from 1761 to 1763 when the French got it in exchange for Nova Scotia. A few of the inhabitants of the latter territory migrated to Belle-Île, which is partly peopled by their descendants. The town of Le Palais (pop. [1926] 1,825) has an old citadel and fortifications and possesses a port which is accessible to small vessels. The inhabitants, who have declined in numbers, engage in agriculture and fisheries, and in the preservation of sardines, anchovies, etc. The island breed of draught horses was highly prized.

BELLE-ISLE, CHARLES LOUIS AUGUSTE FOUQUET, COMTE, and later Duc, DE (1684-1761), French soldier and statesman, grandson of Nicholas Fouquet, was born at Villefranche, Rouergue, on Sept. 22, 1684. He entered the army at an early age, and distinguished himself in the war of the Spanish Succession and in the Spanish war of 1718-19. In the war of the Polish Succession he was in command of a corps under Marshal Berwick, and on the conclusion of peace (1736) became governor of the fortresses of Metz, Toul and Verdun and a marshal of France. In 1741 he was employed by the French government in Germany to oppose the pragmatic sanction and to

secure the election of Charles, Elector of Bavaria, as emperor. During the war of the Austrian Succession he stormed Prague (Nov. 26, 1741), and then executed that difficult retreat in 1742 to Eger, which was one of the most remarkable achievements of the French army in this campaign. In crossing Hanover on his way to Berlin he was captured by the English, but was exchanged in 1745. In 1746 he was placed in command of the "Army of Piedmont" in Provence, where he repelled the Italo-Spanish invasion and carried the war into Lombardy. He was created duke and peer of France (1748) and was minister of war in 1757-60, carrying out substantial reorganizations in the army. He died at Versailles Jan. 26, 1761.

His brother, LOUIS CHARLES ARMAND FOUQUET, known as the Chevalier de Belle-Isle, was a distinguished soldier and was killed at the Battle of Exilles on July 19, 1746.

BELLE ISLE, STRAIT OF, the more northerly of the two channels connecting the Gulf of St. Lawrence with the Atlantic between northern Newfoundland and Labrador; its length is 35m. from north-east to south-west, breadth 10 to 15m. Belle Isle is a precipitous granite island, 700ft. high, at its Atlantic entrance, with lighthouses and wireless station. The strait is in the most direct route from Europe to the St. Lawrence, but is open only from June till the end of November, and even then is often dangerous through floating ice and fogs. Through it Jacques Cartier sailed in 1534. The southern or Cabot strait between Cape Ray in Newfoundland and Cape North in Cape Breton, was discovered later, and the expansion below Belle Isle was long known as *La Grande Baie*. Cabot strait is open all the year, but has occasional drift ice.

BELLENDEN (BALLANTYNE OR BANNATYNE), JOHN (fl. 1533-1587), Scottish writer, was educated at the universities of St. Andrews and Paris. He was in the service of James V. from the king's earliest years, as clerk of accounts. At the request of James he undertook translations of Boece's *Historia Scotorum*, which had appeared at Paris in 1527, and the first five books of Livy. In 1533, he became archdeacon of Moray and a canon of Ross. He was a strenuous opponent of the Reformation, and is said by some authorities to have died at Rome, in 1550; by others to have been still living in 1587. His translation of Boece, entitled *The History and Chronicles of Scotland*, is remarkable for its freedom and vigour of expression.

The *History* was published in 1536; and, edited by Maitland, was reprinted in 1821. The translation of Livy, was not printed till 1822. Two mss. of the latter are extant, one, the older, in the Advocates' library, Edinburgh (which was the basis of the normalized text of 1822), the other (c. 1550) in the possession of Mr. Ogilvie Forbes, of Boyndlie. An edition of the work was edited for the Scottish Text Society by Mr. W. A. Craigie (1901, 1903). The second volume of this edition contains also a complete reprint of the portions of the holograph first draft which were discovered in the British Museum in 1902. Two poems by Bellenden—*The Proheme to the Cosmographie* and the *Proheme of the History*—appeared in the 1536 edition of the *History of Scotland*. Others, bearing his name in the well-known Bannatyne ms. collection made by his namesake George Bannatyne (q.v.), may or may not be his. Sir David Lyndsay, in his prologue to the *Papyngo*, speaks vaguely of:

Ane cunnynge Clark quhilk wrythith craftelic
Ane plant of poetis callit Ballendyne,
Quhose ornat workis my wit can nocht desyne.

The chief sources of information regarding Bellenden's life are the *Accounts of the Lord High Treasurer of Scotland*, his own works and the ecclesiastical records.

BELLENDEN, WILLIAM, Scottish classical scholar (died after 1625). He lived in the reign of James I. (VI. of Scotland), who appointed him "master of requests." Bellenden lived at Paris, where he became professor at the university, and advocate in the parliament. In 1605 was published anonymously his *Ciceronis Princeps*, a compilation of all Cicero's remarks on regal government, digested and systematically arranged. In 1612 there appeared a similar work on consular authority and the Roman senate, *Ciceronis Consul, Senator, Senatusque Romanus*.

His third work, *De Statu Prisci Orbis* (1615), is a good outline of general history. All three works were combined in a large volume, entitled *De Statu Libri Tres* (1615), which was first brought into due notice by Dr. Samuel Parr, who published an edition in 1787. The greatest of Bellenden's works is the treatise *De Tribus Luminibus Romanorum*, published posthumously at Paris in 1633. The book is unfinished, and treats only of the first luminary, Cicero; the others intended were apparently Seneca and Pliny. It is said that nearly all the copies were lost on the passage to England. One is in the Cambridge university library.

BELLEROPHON or **BELLEROPHONTES**, a hero, probably of Oriental origin, although provided with a Greek pedigree as early as Homer. In the *Iliad* (vi., 153 foll.), he is son of Glaucus, the son of Sisyphus of Ephyre (traditionally identified with Corinth). Anteia, wife of Proetus, king of Argos, loves him, and on her overtures being rejected, falsely accuses him to her husband (theme of Potiphar's wife, fairly common in Greek). He sends Bellerophon to his father-in-law, the king of Lycia (Iobates as later authors call him), with a written message that he is to be slain. The king sends him against the Chimaera (literally "goat," a fire-breathing monster part goat, part serpent, part lion), then against the Solymi, a warlike tribe, then against the Amazons, and finally, when he vanquishes them all, sets chosen warriors in ambush to kill him. Bellerophon kills them, and the king, recognizing him as more than human, marries him to his daughter. He lives in prosperity a while, then falls out of favour with the gods, loses two of his children, and wanders, grief-stricken and shunning mankind, over the "Aelean Plain," i.e., the Plain of Wandering.

AFTER THE RELIEF IN THE PALAZZO SPADA, ROME

BELLEROPHON LEADING THE WINGED HORSE, PEGASUS, WHICH HE TAMED WITH DIVINE ASSISTANCE wanders, grief-stricken and shunning mankind, over the "Aelean Plain," i.e., the Plain of Wandering.

Later authors, from Pindar on, add that while still at Corinth, Bellerophon tamed the winged horse Pegasus (q.v.) with a bridle which Athena gave him; that he visited Proetus because he had slain either the Corinthian hero Bellerus or his own brother, and so went into exile; that he used Pegasus to fight the Chimaera, and afterwards to punish Anteia (or, as they call her Sthenoboea), by inducing her to ride with him and then dropping her from a great height; that he earned the wrath of the gods by trying to fly up to Heaven, being thrown from Pegasus in consequence, and lamed.

His adventures were frequently represented in ancient art, and formed the subject of the *Iobates* of Sophocles, the *Bellerophon* and *Sthenoboea* of Euripides. Only fragments of these survive.

AUTHORITIES.—To those named in the text, add Pindar, *Isthmians*, vi. (vii.), with his and Homer's scholiasts; Apollodoros, ii. 30 foll.

BIBLIOGRAPHY.—Articles in Roscher's *Lexikon* and Pauly-Wissowa *Realencyklopädie*; Preller-Robert, *Griechische Mythologie*; L. Malten in *Jahrbuch d.k. deutsch. archäol. Instituts* (1925).

BELLES-LETTRES, a term used to designate the more artistic and imaginative forms of literature, as poetry or romance, as opposed to more pedestrian and exact studies. Modern usage applies the word more often to the little hills than to the mountain-peaks of literature, and denotes the essay and the critical study rather than the epics of Homer or the plays of Shakespeare. The term appears to have been first used in English by Swift (1710).

BELLEVILLE, port of entry, Ontario, Canada, capital of Hastings county, 106m.E.N.E. of Toronto, on Bay of Quinte and the Canadian National and Canadian Pacific railways. Pop. (1921) 12,206. Communication is maintained with Lake Ontario and the St. Lawrence by the Canadian Steamship lines. An agricultural centre, it exports cheese and farm produce. The industries are planing mills and cement works, cheese factories and lumbering.

BELLEVILLE, a city of Illinois, U.S.A., 14m. S.E. of St. Louis, adjoining East St. Louis; the county seat of St. Clair county. It is served by the Illinois Central, the Louisville and Nashville and the Southern railways, and (through a belt line for freight) by 22 other railways entering East St. Louis. The population was 24,823 in 1920, of which 2,393 were foreign-born white—the majority from Germany—and was estimated at 28,000 in 1928.

The manufacture of gas and coal stoves, ranges, and warm-air furnaces has been the leading industry for 50 years, employing normally 2,000–2,500 skilled workmen. Other important products are castings, shoes, hosiery, shirts, trousers, stencil-cutting machines, flour and feed, bricks, auto tops, caskets, mine machinery, threshing-machines and tractors. The output of the 80 establishments in 1925 was valued at \$16,398,339. Notable crops of winter wheat and potatoes and a fine variety of white asparagus are grown in the vicinity. Belleville is in the midst of an important bituminous coal-field. About 3,000 miners live in the city, and the 60 mines within a few miles have a combined productive capacity of 6,000,000 tons a year.

Scott Field (619ac.), an important station of the Army Air Corps, with a total personnel of about 800, lies 8m. E. of the city. It is the central supply-depot for the entire lighter-than-air division of the air service, and a training-school for airship pilots and observers. The equipment includes searchlights visible for 50m. and a hangar which covers five acres.

Belleville was settled about 1806; established as the county seat in 1814; and incorporated as a city in 1850. Originally Compton Hill, it was renamed when it became the county seat. Ninian Edwards, the first governor of the Territory of Illinois, and Lyman Trumbull, author of the 13th amendment to the Constitution, were residents of the city. There is an Indian mound seven miles to the north-west.

BELLEVILLE, a town of Essex county, N.J., U.S.A., on the Passaic river, adjoining Newark, and served by the Erie Railroad. The population was 15,660 in 1920, and was estimated at 18,927 in 1925. It is a residential suburb of Newark and New York, and also has considerable manufacturing industries (with an output in 1925 valued at \$17,028,378), including wire, wire cloth, hats, brushes and chemicals. Belleville township was separated from Bloomfield in 1839. A commission form of government was adopted in 1914.

BELLEVUE, a city of Ohio, U.S.A., 45m. S.E. of Toledo, in Huron and Sandusky counties. It is served by the New York Central, the Nickel Plate, the Wheeling and Lake Erie and the Pennsylvania railways. The population in 1920 was 5,776. It has railroad repair shops, limestone quarries, flour-mills and canning factories; ships grain and fruit; and manufactures stoves, motor trucks and farming machinery.

BELLEVUE, a residential borough of Allegheny county, Pennsylvania, U.S.A., on the Ohio river and the Pennsylvania railroad, 5m. N.W. of Pittsburgh. Its population in 1920 was 8,198.

BELLEY, a town of France, capital of an arrondissement, department of Ain, 52m S.E. of Bourg by the P.L.M. railway. Pop. (1926) 3,359. It is situated on vine-covered hills at the southern extremity of the Jura, 3m. from the right bank of the Rhone. Belley is of Roman origin. It was the capital of the province of Bugey, a dependency of Savoy till 1601, when it was ceded to France. In 1385 it was destroyed by fire and rebuilt by the dukes of Savoy. The cathedral of St. Jean has a choir dating from 1413. The manufacture of morocco leather goods and the quarrying of the lithographic stone found in the vicinity are carried on, and there is trade in cattle, grain, wine, truffles and dressed pork. Belley is the seat of a bishop (5th century onwards) and has a prefect, and a tribunal of first instance.

BELL-FLOWER, the name given to various species of *Campanula* (*q.v.*) because of the shape of their handsome flowers.

BELL HARP, a curious musical instrument invented in the 18th century by an Englishman, John Simcox. It was neither a bell nor a harp, but a kind of dulcimer or psaltery (*q.v.*), which derived the first half of its name from the fact that it was sus-

pended and swung from two ear-like projections while being played.

BELLI, GIUSEPPE GIOACHINO (1791–1863), Italian poet, was born at Rome, on Sept. 10, 1791. He wrote some 2,000 satirical sonnets which give a vivid picture of the Rome of the last days of the temporal power. He died on Dec. 21, 1863.

See Morandi's edition, *I sonetti romaneschi* (1886–89).

BELLIGERENCY, the state of carrying on war in accordance with the law of nations. Insurgents are not as such excluded from recognition as belligerents, and, even where not recognized as belligerents by the government against which they have rebelled, they may be so recognized by a neutral state, as in the case of the American Civil War, when the Southern states were recognized as belligerents by Great Britain, though regarded as rebels by the Northern states. The recognition of belligerency by a neutral state does not, however, imply recognition of independent political existence. The Hague Convention iv., 1907, deals with the qualifications of belligerents. To entitle troops to the special privileges attaching to belligerency, it is provided that all regular, militia or volunteer forces shall be commanded by persons responsible for the acts of their men, that all such shall carry distinctive emblems, recognizable at a distance, that arms shall be carried openly and operations conducted in accordance with the laws and customs of war. In naval war, privateering having been finally abolished as among the parties to it by the Declaration of Paris, a privateer is not entitled, as between such parties, to the rights of belligerency. As between states, one of whom is not a party to the Declaration, the right to grant letters of marque would remain intact for both parties, and the privateer, *as between them*, would be a belligerent; as regards neutrals, the situation would be complicated (see *PRIVATEER*).

BELLINGHAM, SIR EDWARD (d. 1549) was a son of Edward Bellingham of Erringham, Sussex, his mother being a member of the Shelley family. In May 1548 he was sent to Ireland as lord deputy. Ireland was then in a very disturbed condition, but the new governor crushed a rebellion of the O'Connors in Leinster, freed the Pale from rebels, built forts, and made the English power respected in Munster and Connaught. Bellingham, however, was a headstrong man, and was constantly quarrelling with his council; but one of his opponents admitted that he was "the best man of war that ever he had seen in Ireland." His short but successful term of office was ended by his recall in 1549.

See R. Bagwell, *Ireland Under the Tudors*, vol. i. (1885).

BELLINGHAM, a city near the north-west corner of Washington, U.S.A., on the east shore of Bellingham bay, 18m. from the Canadian border; a port of entry and the county seat of Whatcom county. It is on the Pacific highway, is served by the Great Northern, the Northern Pacific and the Chicago, Milwaukee, St. Paul and Pacific railways, and is a port of call for 12 steamship lines. Its area is 21 sq. m. The population was 11,062 in 1900; 25,585 in 1920; and was estimated locally at 37,000 in 1927.

Bellingham is surrounded by some of the loveliest scenery of America. The Olympic, the Selkirk and the Cascade mountains are visible from the city, with the San Juan islands and Puget sound just outside. Within a few miles are several freshwater lakes. Glacier-crowned Mt. Baker (10,750ft.) and Mt. Shuksan (9,038ft.) are 60m. E., in the Mt. Baker National Recreation Area of 75,000ac., recently established by the Federal Government in the Mt. Baker forest preserve. The city is famous for its tulips and hyacinths, and a tulip festival is held every spring. The bulb experiment station of the U.S. department of agriculture is here.

Bellingham has a fine deep-water harbour. The total commerce of the port in 1925 amounted to 1,498,371 tons, valued at \$41,333,485, nine times as much as in 1905; and included exports (chiefly canned salmon, lumber, lath and shingles, and floated logs) to the value of \$2,836,639. The city has large salmon and fruit canneries, lumber and shingle mills, cement and wood-pulp plants, and paper-mills; a beet-sugar refinery with a seasonal capacity of 100,000 tons; and a coal-mine with

an annual output of 300,000 tons. It ships great quantities of dairy products, eggs and poultry, including thousands of chicks from the co-operative hatcheries of the county; and is an out-fitting point for the Alaska fishing industry. The largest of the State normal schools is located here. It was opened in 1899, and has an enrolment of more than 2,000.

Bellingham was formed in 1903 by the consolidation of the cities of New Whatcom and Fairhaven.

BELLINI, the name of a family of craftsmen in Venice, three members of which fill a great place in the history of the Venetian school of painting in the 15th and early in the 16th century.

I. **JACOPO BELLINI** (c. 1400–c. 1470) was the son of a tinsmith or pewterer, Nicoletto Bellini, by his wife Franceschina. When the accomplished Umbrian master Gentile da Fabriano came to practise at Venice, where art was backward, several young men of the city took service under him as pupils. Among these was Jacopo Bellini, who followed his teacher to Florence, where the progress made, alike in truth to natural fact and in sense of classic grace and style, by masters like Donatello and Ghiberti, Masaccio and Paolo Uccello, offered him better instruction than he could obtain even from his Umbrian teacher. By 1429 Jacopo was settled at Venice and married to a wife from Pesaro named Anna, who bore her husband two sons, Gentile and Giovanni (though some evidences have been thought to point rather to Giovanni having been his son by another mother), and a daughter Nicolosia. In 1436 Jacopo was at Verona, painting a Crucifixion in fresco for the cathedral (destroyed by order of the archbishop in 1750, but the composition, a vast one of many figures, has been preserved in an old engraving). About 1440 he must have paid a visit to the court of Ferrara, where there prevailed a spirit of free culture and humanism most congenial to his tastes. His relations with the house of Este, which seem to have begun with a portrait of Leonello d'Este, son of the reigning marquis Niccolo III., appear to have been kept up, and among Jacopo's extant drawings are several that probably belong to the scheme of a monument erected to the memory of the marquis Niccolo ten years later. He was also employed by Sigismondo Malatesta at the court of Rimini. In 1453 he received a grant from the confraternity for the marriage of his daughter Nicolosia with Andrea Mantegna, a marriage which had the effect of transferring the gifted young Paduan master definitively from the following of Squarcione to that of Bellini. In 1456 he painted a figure of Lorenzo Giustiniani, first patriarch of Venice, for his monument in San Pietro di Castello, and in 1457, with a son for salaried assistant, three figures of saints in the great hall of the patriarch. His activity can be traced in documents down to Aug. 1470, but in Nov. 1471 his wife Anna describes herself as his relict, so that he must have died some time in the interval.

The materials which have reached posterity for a critical judgment on his work consist of four or five pictures only, together with two important and invaluable books of drawings. These prove him to have been a worthy third, following the Umbrian Gentile da Fabriano and the Veronese Pisanello, in that trio of artists who in the first half of the 15th century carried towards maturity the art of painting in Venice and the neighbouring cities. Of his pictures, an important signed example is a life-size Christ Crucified in the archbishop's palace at Verona. The rest are almost all Madonnas; two signed, one in the Tadini gallery at Loreve, another in the Venice academy; a third, unsigned and long ascribed in error to Gentile da Fabriano, in the Louvre, with the portrait of Sigismondo Malatesta as donor; a fourth, richest of all in colour and ornamental detail, in the Uffizi at Florence. Plausibly, though less certainly, ascribed to him are a fifth Madonna at Bergamo, a warrior-saint on horseback (San Crisogono) in the church of San Trovaso at Venice, a Crucifixion in the Museo Correr, and an Adoration of the Magi in private possession at Ferrara. But an abundance of drawings and studies are preserved in two precious albums in the British Museum and the Louvre. The former, which is the earlier in date, belonged to the painter's elder son Gentile, and was by him bequeathed to his brother Giovanni. It consists of 99 paper pages, each covered on both sides with drawings made with a lead point, an instrument

unusual at this date. Two or three of the drawings have been worked over in pen; of the remainder many have become dim from time and rubbing. The album at the Louvre, discovered in 1883 in the loft of a country-house in Guienne, is equally rich and better preserved, the drawings being all highly finished in pen, probably over effaced preliminary sketches in chalk or lead. The range of subjects is much the same in both collections, and in both extremely varied, proving Jacopo to have been a craftsman of many-sided curiosity and invention. Jacopo's influence on the development of Venetian art was very great, not only directly through his two sons and his son-in-law Mantegna, but through other and independent contemporary workshops of the city, in none of which did it remain unfelt.

II. **GENTILE BELLINI** (c. 1429–1507), the elder son of Jacopo, first appears independently as the painter of a Madonna, much in his father's manner, dated 1460, and now in the Berlin museum. In July 1466 we find him contracting with the officers of the Scuola of St. Mark as an independent artist to decorate the doors of their organ. These paintings still exist in a blackened condition. They represent four saints, colossal in size, and designed with much of the harsh and searching austerity which characterized the Paduan school under Squarcione. Gentile must have risen steadily in the esteem of his fellow-citizens, since in 1474 we find him commissioned by the senate to restore, renew, and when necessary replace, the series of paintings, the work of an earlier generation of artists, which were perishing from damp on the walls of the Hall of the Great Council in the ducal palace. In continuation of this work Gentile undertook a series of independent paintings on subjects of Venetian history for the same hall, but had apparently only finished one, representing the delivery of the consecrated candle by the pope to the doge, when his labours were interrupted by a mission to the East. The sultan Mohammed II. had despatched a friendly embassy to Venice, inviting the doge to visit him at Constantinople and at the same time requesting the despatch of an excellent painter to work at his court. Gentile Bellini with two assistants was selected for the mission, his brother Giovanni being at the same time appointed to fill his place on the works for the Hall of the Great Council. Gentile gave great satisfaction to the sultan, and returned after about a year with a knighthood, some fine clothes, a gold chain and a pension. The surviving fruits of his labours at Constantinople consist of a large painting representing the reception of an ambassador in that city, now in the Louvre; a highly finished portrait of the sultan himself, one of the treasures, despite its damaged condition, of the collection of the late Sir Henry Layard, and now in the National Gallery, London; an exquisitely wrought small portrait in water-colour of a scribe, found in 1905 by a private collector in the bazaar at Constantinople and now in the collection of Mrs. Gardner at Boston; and two pen-and-ink drawings of Turkish types, now in the British Museum. Early copies of two or three other similar drawings are in the Städel Institute at Frankfurt.

A place had been left open for Gentile to continue working beside his brother Giovanni in the ducal palace; and soon after 1480 he began to carry out his share in the great series of frescoes, unfortunately destroyed by fire in 1577, illustrating the part played by Venice in the struggles between the papacy and the emperor Barbarossa. These works were executed not on the wall itself but on canvas (the climate of Venice having so many times proved fatal to wall paintings), and probably in oil, a method which all the artists of Venice, following the example set by Antonello da Messina, had by this time learnt or were learning to practise. They received the highest praise both from contemporary and from later Venetian critics, but no fragment of them survived the fire of 1577, though a drawing in the British Museum purports to be the artist's original sketch for the subject of the pope bestowing a sword and his blessing on the doge and his army. Their character can to some extent be judged by a certain number of kindred historical and processional works by the artist which have been preserved. Of such the Academy at Venice has three which were painted between 1490 and 1500 for the Scuola of St. John the Evangelist, and represent certain events connected with a famous relic belonging to the Scuola, namely, a supposed frag-

ment of the true cross. All have been much injured and repainted; nevertheless one at least, showing the procession of the relic through St. Mark's Place and the thanksgiving of a father who owed to it the miraculous cure of his son, still gives a good idea of the painter's powers and style. Great accuracy and firmness of individual portraiture, a strong gift, derived no doubt from his father's example, for grouping and marshalling a crowd of personages in spaces of fine architectural perspective, the severity and dryness of the Paduan manner much mitigated by the dawning splendour of true Venetian colour—these are the qualities that no injury has been able to deface. They are again manifest in an interesting Adoration of the Magi in the Layard collection at the National Gallery, London, and reappear still more forcibly in the last work undertaken by the artist, the great picture, now at the Brera in Milan, of St. Mark preaching at Alexandria; this was commissioned by the Scuola of St. Mark in March, 1505, and left by the artist in his will, dated Feb. 18, 1507, to be finished by his brother Giovanni. Of single portraits by this artist, who was almost as famous for them as for processional groups, there survive one of a doge at the Museo Correr in Venice, one of Catarina Cornaro at Budapest, one of a mathematician at the National Gallery, another of a monk in the same gallery, signed wrongly to all appearance with the name of Giovanni Bellini, besides one or two others in private hands. The features of Gentile himself are known from a portrait medallion by Camello, and can be recognized in two extant drawings, one at Berlin supposed to be by the painter's own hand, and another, much larger and more finished, at Christ Church, Oxford, which is variously attributed to Bonsignori and A. Vivarini.

III. GIOVANNI BELLINI (c. 1430–1516) is generally assumed to have been the second son of Jacopo by his wife Anna; though the fact that she does not mention him in her will with her other sons has thrown some slight doubt upon the matter. Until the age of nearly thirty both sons served as their father's assistants in works at Venice and Padua. In Giovanni's earliest independent works, we find him more strongly influenced by the harsh and searching manner of the Paduan school, and especially of his own brother-in-law Mantegna, than by the more graceful and facile style of Jacopo. This influence seems to have lasted at full strength until after the departure of Mantegna for the court of Mantua in 1460. The earliest of Giovanni's independent works no doubt date from before this period. Three of these exist at the Correr museum in Venice: a Crucifixion, a Transfiguration, and a Dead Christ supported by Angels. Two Madonnas of the same or even earlier date are in America, one at the Metropolitan Museum, New York, the other in the Johnson Collection, Philadelphia; a third, that of Signor Frizzoni is now in the Museo Correr at Venice; while two beautiful works in the National Gallery of London seem to bring the period to a close. One of these is of a rare subject, the Blood of the Redeemer; the other is the fine picture of Christ's Agony in the Garden, formerly in the Northbrook collection. The last-named piece was evidently executed in friendly rivalry with Mantegna, whose version of the subject hangs near by; the main idea of the composition in both cases being taken from a drawing by Jacopo Bellini in the British Museum sketch-book. In all these pictures Giovanni combines with the Paduan severity of drawing and complex rigidity of drapery a depth of religious feeling and human pathos which is his own. They are all executed in the old tempera method; and in the last named the tragedy of the scene is softened by a new and beautiful effect of romantic sunrise colour. In a somewhat changed and more personal manner, with less harshness of contour and a broader treatment of forms and draperies, but not less force of religious feeling, are the two pictures of the Dead Christ supported by Angels, in these days one of the master's most frequent themes, at Rimini and at Berlin. Chronologically to be placed with these are two Madonnas, one at the church of the Madonna del Orto at Venice and one in the Lochis collection at Bergamo; devout intensity of feeling and rich solemnity of colour being, as in the case of all these early Madonnas, combined with a singularly direct rendering of the natural movements and attitudes of children.

The above-named works, all executed in tempera, are no doubt earlier than the date of Giovanni's first appointment to work along with his brother and other artists in the Scuola di San Marco, where among other subjects he was commissioned in 1470 to paint a Deluge with Noah's Ark. None of the master's works of this kind, whether painted for the various schools or confraternities or for the ducal palace, have survived. To the decade following 1470 must probably be assigned a Transfiguration now in the Naples museum, and also the great altar-piece of the Coronation of the Virgin at Pesaro. After 1470–80 very much of Giovanni's time and energy must have been taken up by his duties as conservator of the paintings in the great hall of the ducal palace. Besides repairing and renewing the works of his predecessors he was commissioned to paint a number of new subjects, six or seven in all, in further illustration of the part played by Venice in the wars of Barbarossa and the Pope. Not a trace of these survived the fire of 1577; neither have any other examples of his historical and processional compositions come down. Of the other, the religious class of his work, including both altar-pieces with many figures and simple Madonnas, a considerable number have fortunately been preserved. They show him gradually throwing off the last restraints of the 15th-century manner; gradually acquiring a complete mastery of the new oil medium introduced in Venice by Antonello da Messina about 1473, and mastering with its help all, or nearly all, the secrets of the perfect fusion of colours and atmospheric gradation of tones. The old intensity of pathetic and devout feeling gradually fades away and gives place to a noble, if more worldly, serenity and charm. The enthroned Virgin and Child become tranquil and commanding in their sweetness; the personages of the attendant saints gain in power, presence and individuality; enchanting groups of singing and viol-playing angels symbolize and complete the harmony of the scene. The full splendour of Venetian colour invests alike the figures, their architectural framework, the landscape and the sky. The altar-piece of the Frari at Venice, the altar-piece of San Giobbe, now at the academy, the Virgin between SS. Paul and George, also at the academy, and the altar-piece with the kneeling doge Barbarigo at Murano, are among the most conspicuous examples. Simple Madonnas of the same period (about 1485–90) are in the Venice academy, in the National Gallery, at Turin and at Bergamo. An interval of some years seems to separate the last-named altar-pieces from that of the church of San Zaccaria at Venice, which is perhaps the most beautiful and imposing of all, and is dated 1505. Another great altar-piece with saints, that of the church of San Francesco de la Vigna at Venice, belongs to 1507; that of La Corona at Vicenza, a Baptism of Christ in a landscape, to 1510; to 1513 that of San Giovanni Crisostomo at Venice, where the aged saint Jerome, seated on a hill, is raised high against a resplendent sunset background, with SS. Christopher and Augustine standing facing each other below him, in front. The examples which remain of Giovanni's activity in the interval between the altar-pieces of San Giobbe and of Murano and that of San Zaccaria, consist of one allegorical picture in the Uffizi at Florence, the subject of which is an illustration of a French mediaeval allegory, the *Pèlerinage de l'âme* by Guillaume de Guilleville, and a set of five other allegories or moral emblems, on a smaller scale and very romantically treated, in the academy at Venice. To these should probably be added, as painted towards the year 1505, the portrait of the doge Loredano in the National Gallery, the only portrait by the master which has been preserved, and in its own manner one of the most masterly in the whole range of painting.

The last ten or twelve years of the master's life saw him besieged with more commissions than he could well complete. Albrecht Dürer, visiting Venice for a second time in 1506, reports Giovanni Bellini as still the best painter in the city, and as full of all courtesy and generosity towards foreign brethren of the brush. In 1507 Gentile Bellini died, and Giovanni completed the picture of the "Preaching of St. Mark" which he had left unfinished. In 1514 Giovanni undertook to paint a Bacchanal for the duke Alfonso of Ferrara, but died in 1516, leaving it to be finished by his pupils; this picture is now at Alnwick.

Both in the artistic and in the worldly sense, the career of Giovanni Bellini was upon the whole the most serenely and unbrokenly prosperous, from youth to extreme old age, which fell to the lot of any artist of the early Renaissance. He lived to see his own school far outshine that of his rivals, the Vivarini of Murano; he embodied, with ever growing and maturing power, all the devotional gravity and much also of the worldly splendour of the Venice of his time; and he saw his influence propagated by a host of pupils, two of whom at least, Giorgione and Titian, surpassed their master. Giorgione he outlived by five years; Titian, as we have seen, challenged an equal place beside his teacher. Among the best known of his other pupils were, in his earlier time, Andrea Previtali, Cima da Conegliano, Marco Basaiti, Niccolo Rondinelli, Piermaria Pennacchi, Martino da Udine, Girolamo Mocetto; in later time, Pierfrancesco Bissolo, Vincenzo Catena, Lorenzo Lotto and Sebastian del Piombo.

Goloubew by far the most skilfully, the contents of both the Paris and the London sketch-books).

(S. C.; X.)

BELLINI, LORENZO (1643–1704), Italian physician and anatomist, was born at Florence on Sept. 3, 1643. At the age of 20, when he had already begun his researches on the structure of the kidneys and had described the ducts known by his name (*Exercitatio anatomica de structura et usu renum*, 1662), he was chosen professor of theoretical medicine at Pisa, but soon after was transferred to the chair of anatomy. He died at Florence on Jan. 8, 1704.

BELLINI, VINCENZO (1801–1835), operatic composer of the Italian school, was born at Catania in Sicily, on Nov. 1, 1801. He was descended from a family of musicians, both his father and grandfather having been composers of some reputation. After having received his preparatory musical education at home, he entered the conservatoire of Naples, where he studied singing and composition under Tritto and Zingarelli. His first opera, *Adelson e Savina*, was performed in 1825 at a small theatre in Naples; his second dramatic work, *Bianca e Fernando*, was produced next year at the San Carlo theatre of the same city, and made his name known in Italy. His next work, *Il Pirata* (1827), was written for the Scala in Milan, to words by Felice Romano, with whom Bellini formed a union of friendship to be severed only by his early death. Of Bellini's operas the best known are: *I Montecchi e Capuleti* (1830), in which the part of Romeo, sung in England by Madame Pasta, became a favourite with all the great contraltos; *La Sonnambula* (1831); *Norma*, Bellini's best and most popular creation (1831); and *I Puritani* (1835), written for the Italian opera in Paris, and to some extent under the influence of French music. He was seized with a sudden illness, and died at his villa in Puteaux near Paris, on Sept. 24, 1835. Bellini's operas had an immense vogue in their day, and then suffered a rather undeserved eclipse. They had little dramatic force, but a wealth of melody.

See C. Labat, *Bellini* (Bordeaux, 1865); A. Pougin, *Bellini, sa vie et ses oeuvres* (1868); Pizzetti, *La musica di Vincenzo Bellini* (1916).

BELLINZONA, the political capital of the Swiss canton of Tessin or Ticino, 105m. from Lucerne by the St. Gotthard railway, and 14m. from Locarno. Until 1881 it was joint capital of the canton, with Lugano and Locarno. The old town is built on

some high ground rising from the level valley floor of the Ticino, a little below the junction of the Val Mesocco. It thus blocked the road from Germany to Italy, while a great wall was built from the town to the river bank. Bellinzona still possesses three picturesque castles (restored in modern times), dating in their present form from the 15th century. They belonged for several centuries to the three Swiss cantons which were masters of the town. The most westerly, Castello Grande (or San Michele), belonged to Uri; the central castle, that of Montebello, was the property of Schwyz; while that of Sasso Corbaro was in the hands of Unterwalden. The church of San Biagio (Blaise) has a remarkable 14th-century fresco, while the collegiate church of San Stefano dates from the 16th century. Pop. (1920) 10,232, practically all Roman Catholic and Italian speaking.

Bellinzona is possibly of Roman origin; it is first mentioned in 590. It played a considerable part in the early history of Lombardy, being a key to several Alpine passes. In the 8th century it belonged to the bishop of Como, while in the 13th and 14th centuries it was tossed to and fro between the cities of Milan and Como. In 1499 (like the rest of the Milanese) it was occupied by the French, but in 1500 it was taken by Uri. In 1503 the French king ceded it to Uri, Schwyz and Unterwalden. It became in 1798 the capital of the canton Bellinzona of the Helvetic republic, but in 1803 it was united to the newly-formed canton of Ticino.

BELLMAN, KARL MIKAEL (1740–1795), Swedish poet, son of a civil servant, was born at Stockholm. When he was 19 he became clerk in a bank and afterwards in the customs, but his habits were irregular and he was frequently in great distress, particularly after the death of his patron, Gustavus III. As early as 1757 he published *Evangeliska Dödstänkar*, meditations on the Passion from the German of David von Schweidnitz, and during the next few years wrote, besides other translations, a great quantity of poems, imitative for the most part of Dalin. In 1760 appeared his first characteristic work, *Månan* (The Moon), a satirical poem, which was revised and edited by Dalin. But the great work of his life occupied him from 1765–80, and consists of the collections of dithyrambic odes known as *Fredmans Epistlar* (1790) and *Fredmans Sångar* (1791). Fredman and his friends were well-known characters in the Stockholm pot-houses, where Bellman studied them from the life. He was accustomed, when in the presence of none but confidential friends, to announce that the god was about to visit him. He would shut his eyes, take his zither, and begin apparently to improvise the music and the words of a long Bacchic ode in praise of love or wine. Most of his melodies are taken direct, or with slight adaptations, from old Swedish ballads, and still retain their popularity. His torrents of rhymes are not without their method; wild as they seem, they all conform to the rules of style which he accepted. A great Swedish critic has remarked that the jovial humour of Bellman is, after all, only "sorrow clad in rose-colour," and this underlying pathos gives his poems their undying charm. Much of Bellman's work was only printed after his death, *Bihang till Fredmans Epistlar* (Nyköping, 1809), *Fredmans Handskrifter* (Uppsala, 1813), *Skaldestycken* ("Poems," 1814) being among the most important of these posthumous works. A colossal bronze bust of the poet by Byström (erected by the Swedish Academy in 1829) adorns the public gardens of Stockholm, and a statue by Alfred Nyström is in the Hasselbacken, Stockholm. Bellman was a favourite companion of King Gustavus III.

The best edition of his works was published at Stockholm, edited by J. G. Carlén, with biographical notes, illustrations and music (1856–61); see also monographs on Bellman by Nils Erdmann (1895) and by F. Niedner (Berlin, 1905).

BELL-METAL, the alloy used for bell founding, consists of three to five parts of copper to one of tin. It is a metal harder than either of its components, and empirical experiment discovered ages ago that it possesses a peculiar degree of sonority. (See ALLOYS.)

BELLO, ANDRÉS (1781–1865), South American poet and scholar, was born at Caracas, Venezuela, on Nov. 29, 1781. After having been associated with the revolutionary movement against

Spain, in 1810 he was sent on a political mission to London, where he resided for 19 years, acting as secretary to the legations of Chile, Colombia and Venezuela, spending his free time in study, teaching and journalism. In 1829 he accepted a post in the Chilean treasury, settled at Santiago and took a prominent part in the intellectual life of the city, particularly in founding the national university (1843), of which he became rector. He was nominated senator, and died at Santiago de Chile on Oct. 15, 1865. Bello was mainly responsible for the civil code promulgated in 1855. His prose works deal with such varied subjects as law, philosophy, literary criticism and philology; of these the most important is his *Gramática castellana* (1847), the leading authority on the subject. But his position in literature proper is secured by his *Silvas Americanas*, a poem written during his residence in England, which conveys with extraordinary force the majestic impression of the South American landscape.

Bello's complete works were issued in 15 volumes by the Chilean Government (Santiago de Chile, 1881-93); he is the subject of an excellent biography by Miguel Luis Amunátegui (Santiago de Chile, 1882).

BELLOC, JOSEPH HILAIRE PIERRE (1870-), British author, was born at La Celle, St. Cloud, France, July 27 1870, the son of a French barrister, Louis Swanton Belloc. His mother, Bessie Rayner Parkes (1820-1925), was prominent in the early days of the woman suffrage movement. Belloc was educated at the Oratory school, Edgbaston, then, as a French citizen, served with the artillery at Toul, afterwards entering Balliol college, Oxford, in 1893. He was naturalized in 1902. He was M P for Salford from 1906 to 1910, first as a Liberal then as an Independent.

Verses and Sonnets (1896) launched Belloc on a varied, not to say tempestuous, literary voyage. Historical studies of *Danton* (1899) and *Robespierre* (1901) first proved his lively historical sense and compelling prose style. His independence of mind in politics showed itself at Oxford, later as a staunch opponent of the South African War and again in the circumstances of his retirement from parliamentary politics; it was shown too, in his association with Cecil Chesterton in conducting *The Eye Witness*, and in writing *The Party System* (1911), and *The Servile State* (1912). Books of nonsense rhymes, such as *The Bad Child's Book of Beasts* (1896); *The Path to Rome* (1902); satires such as *Mr. Clutterbuck's Election* (1908) and *The Mercy of Allah* (1922), numerous volumes of essays and travel sketches; collected poems (1924); military and topographical studies; and *The Cruise of the Nona* (1925)—these are samples of a great versatility of talent. As an upholder of nationalism and the Catholic tradition Belloc has summed up his attitude best in *The Jews* (1922), *Europe and the Faith* (1920), and *How the Reformation Happened* (1928). His works on French history include *Marie Antoinette* (1909). He is also the author of a *History of England* in five volumes, of which three had appeared by 1928.

BELLO-HORIZONTE, a city of Brazil, capital of the State of Minas Geraes, about 50m. N W of Ouro Preto, connected with the Central of Brazil railway by a branch line 9m. in length. Pop. in 1922, 55,563. The city was built by the State on an open plateau about 3,000ft. above the sea, and provided with all necessary public buildings, gas, water and tramway services before the seat of government was transferred from Ouro Preto. The city has grown rapidly, and is considered one of the most attractive State capitals of Brazil.

BELLONA, originally **DUELLONA**, in Roman mythology, the goddess of war (*bellum, duellum*), corresponding to the Greek *Enūō*. Sometimes known as the sister or wife of Mars, she has been identified with the Sabine war goddess Nerio. Her temple at Rome, dedicated by Appius Claudius Caecus (206 B.C.) during a battle with the Samnites and Etruscans (Ovid, *Fasti*, vi. 201), stood in the Campus Martius, near the Flaminian Circus, and outside the gates of the city. It was there that the senate met to discuss a general's claim to a triumph, and to receive ambassadors from foreign States. In front of it was the *columna bellica*, where the ceremony of declaring war by the *fetialis* (see *HERALD*) was performed.

The Asiatic Bellona, whose worship was introduced into Rome from Comana, in Cappadocia, apparently by Sulla, during the first Mithridatic war is to be distinguished from this native Italian goddess. A new temple was built for her and a college of priests (*Bellonarii*) instituted to conduct her fanatical rites, at which, wearing black dresses, they lacerated their arms and loins, sprinkled the blood from their wounds on the spectators, and even drank that of the sacrificial victims.

See W. W. Fowler, *Roman Festivals* (1899); G. Wissowa, *Religion und Kultus der Römer* (1912).

BELLOT, JOSEPH RENÉ (1826-1853), French Arctic explorer, was born at Rochefort on March 18, 1826, the son of a farrier. With the aid of the authorities of his native town he was enabled at the age of 15 to enter the naval school. He took part in the Anglo-French expedition of 1845 to Madagascar, and received the cross of the Legion of Honour for distinguished conduct. He afterwards took part in another Anglo-French expedition, that of Parana, which opened the River La Plata to commerce. In 1851 he joined the Arctic expedition under the command of Captain Kennedy in search of Sir John Franklin, and discovered the strait between Boothia Felix and Somerset Land which bears his name. Early in 1852 he was promoted lieutenant, and in the same year accompanied the Franklin search expedition under Captain Inglefield. He perished by falling into a crevasse (August 1853).

BELLOWS, ALBERT F. (1820-1883), American landscape painter, was born at Milford (Mass.), Nov. 20, 1820. He first studied architecture, then turned to painting, and worked in Paris and in the Royal Academy at Antwerp. He painted much in England; was a member of the National Academy of Design, and of the American Water Color Society, New York; and an honorary member of the Royal Belgian Society of Water-Colourists. His earlier work was *genre*, in oils; after 1865 he used water-colours more and more exclusively and painted landscapes. Among his water-colours are "Afternoon in Surrey" (1868); "Sunday in Devonshire" (1876), exhibited at the Philadelphia Exposition; "New England Village School" (1878); and "The Parsonage" (1879). He died in Auburndale (Mass.), on Nov. 24, 1883.

BELLOWS, GEORGE WESLEY (1882-1925), American artist, was born in Columbus (O.), on Aug. 12, 1882. Educated at Ohio State university, he moved in 1904 to New York, where he studied art under Robert Henri. In 1910, 1918 and 1919 he was an instructor at the Art Students' League in New York city, and in 1919 taught also at the Chicago Art institute. His work is distinguished by dignity of composition, vitality and intense interest in life. His drawings and lithographs include many notable illustrations of sporting subjects, and his painting showed at first a preference for sable shades. Later, however, he added to the distinction of his drawing a rich, vibrant use of colour. Among his paintings may be mentioned "Jean and Anna," in the Albright Art gallery, Buffalo (N.Y.); "Emma and Her Children," in the Boston Museum of Fine Arts; "Portrait of my Mother," in the Chicago Art institute; "Polo Game," in the Columbus Gallery of Fine Arts; "Stag at Sharkeys," in the Cleveland museum; "Men of the Docks," owned by Randolph-Macon Woman's college, Lynchburg (Va.); "Up the Hudson," in the Metropolitan Museum, New York city, and "North River," in the Pennsylvania Academy of Fine Arts, Philadelphia. He died in New York city on Jan. 8, 1925.

See Thomas Beer, *The Lithographs of George Bellows* (New York, 1927).

BELLOWS, an appliance to produce a current of air by compressing a collapsible bag or receptacle into which air has been admitted. The O.E. word for bellows was *blástbaelig*; i.e., "blow-bag." By the 11th century *baelig*, bag, is found in early glossaries. *Baelig* became in M.E. *bcly*, the plural "bellies" being found till the 16th century, when "bellows" appears, and the word in the singular ceases to be used.

Among the earliest contrivances employed for producing the movement of air under a small pressure were those used in Egypt during the Greek occupation. These depended upon the heating of the air, which, being raised in pressure and bulk, was made to

force water out of closed vessels, the water being afterwards employed for moving some kind of mechanism. In the process of iron smelting there is still used in some parts of India an artificial blast, produced by a simple form of bellows made from the skins of goats; bellows of this kind probably represent one of the earliest contrivances used for producing currents of air.

The bellows now in use consists, in its simplest form, of two flat boards, of rectangular, circular or pear shape, connected round their edges by a wide band of leather so as to include an air chamber, which can be increased or diminished in volume by separating the boards or bringing them nearer together. The leather is kept from collapsing, on the separation of the boards, by wire rings which act like the ribs of animals. The lower board has a hole in the centre, covered inside by a leather flap or valve which can only open inwards; there is also an open outlet, generally in the form of a pipe or nozzle, the aperture of which is much smaller than that of the valve. When the upper board is raised air rushes into the cavity through the valve to fill up the partial vacuum produced; on again depressing the upper board the valve is closed by the air seeking an outlet, and this air is discharged through the open nozzle with a velocity depending on the pressure exerted.

Double Bellows.—It is evident that the current of air produced is not continuous but intermittent or in puffs, because an interval is needed to refill the cavity after each discharge. In order to remedy this drawback the *double bellows* are used. To understand their action it is only necessary to conceive an additional board with valve, like the lower board of the single bellows, attached in the same way by leather below this lower board. Thus there are three boards, forming two cavities, the two lower boards being fitted with air-valves. The lowest board is held down by a weight and another weight rests on the top board. In working these double bellows the lowest board is raised, driving the air from the lower cavity into the upper. On lowering the bottom board again a fresh supply of air is drawn in through the bottom valve, to be discharged again when the board is raised. As the air passes from the lower to the upper cavity it is kept from returning by the valve in the middle board, and in this way a quantity of air is sent into the upper cavity each time the lowest board is raised. The weight on the top board provides the necessary pressure for the blast, and at the same time causes the current of air delivered to be fairly continuous. When the air is being forced into the upper cavity the weight is being raised, and, during the interval when the lowest board is descending, the weight is slowly forcing the top board down and thus keeping up a continuous flow of air.

Hand-bellows for domestic use are generally shaped like a pear, with the hinge at the narrow end. The same shape was adopted for the older forms of smiths' bellows; with the difference that two bellows were used superposed, in a manner similar to that just described, so as to provide for a continuous blast. In the later form of smiths' bellows the same principle is employed, but the boards are made circular in shape and are always maintained roughly parallel to one another. These are shown in the figure. Here A is the blast pipe, B the movable lowest board, C the fixed middle board, close to which the pipe A is inserted, and D is the movable uppermost board pressed upon by the weight shown. The board B is raised by means of a hand lever L, through either

a chain or a connecting rod, and lowered by a weight. The size of the weight on D depends on the air pressure required. For instance, if a blast pressure of half a pound per square inch is wanted and the boards are 18 in. in diameter, and therefore have an area of 254 sq. in., on each of the 254 sq. in. there is to be a pressure of half a pound, so that the weight to balance this must be half of 254, or 127 pounds. The diameter of the air-pipe can be varied to suit the required conditions. Instead of bellows with flexible sides, a sliding arrangement is sometimes used; this consists of what are really two boxes fitting into one another with the open sides both facing inwards, as if one were acting as a lid to the other. By having a valve and outlet pipe fitted as in the bellows and sliding them alternately apart and together, an intermittent blast is produced. The chief defect of this arrangement is the leakage of air caused by the difficulty in making the joint a sufficiently good fit to be air-tight.

BELLOWS FALLS, an incorporated village of Windham county, Vermont, U.S.A., beautifully situated on the Connecticut river, 30m. from the southern boundary of the State; on Federal highway 5, and served by the Boston and Maine and the Rutland railways. The population was 4,860 in 1920, and the local estimate for 1928, including the suburbs of North Walpole and North Westminster, was 7,500. The village is the trade centre for a population of 20,000, a summer resort, and the shipping point for dairy and farm products. There is a co-operative creamery supplied from 900 farms, and many cars of bottled milk go to Boston daily. Hydro-electric power (60,000h.p.) is developed from the falls of the Connecticut at this point, and the village has numerous manufacturing industries. Bellows Falls was settled about 1761 and incorporated in 1831. The damage in the village and vicinity from the floods of 1927 was estimated at about \$2,000,000.

BELLOY, DORMONT DE, the name assumed by PIERRE LAURENT BUIRETTE (1727-1775), French dramatist. He was born at Saint-Flour, in Auvergne, on Nov. 17, 1727, and educated for the bar. To escape from a profession he disliked he joined a troupe of comedians playing in the courts of the northern sovereigns. He returned to Paris with *Zelmire* (1762), a fantastic drama which met with great success. This was followed in 1765 by the patriotic play, *Le Siège de Calais*, which had a sensational success, and was followed by *Gaston et Bayard* (1771), *Pedro le cruel* (1772) and *Gabrielle de Verger* (1777). None of these attained the success of the earlier plays. De Belloy died on March 5, 1775. His death is said to have been hastened by disappointment.

BELL PITS, small holes or shafts, 3ft or 4ft. in diameter, driven through a few feet of overlying strata to the seam of coal, and then widened out to allow for excavation. In Sussex there are bell pits which were sunk in prehistoric times to obtain flints for the making of stone implements.

BELL ROCK or **INCHCAPE ROCK**, a sandstone reef in the North Sea, 12m. S.E. of Arbroath, Angus Forfarshire, Scotland. It measures 2,000ft. in length, is under water at high tide, but at low tide is exposed for a few feet, the sea for a distance of 100yds. around being then only three fathoms deep. Lying in the fairway of vessels making or leaving the Tay and Forth, besides ports farther north, it was a constant menace. In the great gale of 1799 seventy sail were wrecked off the reef, and next year Robert Stevenson modelled a tower and reported that its erection was feasible, but parliamentary powers were only obtained in 1806 and operations began August 1807. Though John Rennie had meanwhile been associated with Stevenson as consulting engineer, the design and details are wholly Stevenson's work. The tower is 80ft. high; its diameter at the base is 42ft., decreasing to 15ft. at the top. It is solid for 30ft. at which height the doorway is placed. A bust of Stevenson by Samuel Joseph (d. 1850) was placed in the tower. According to tradition an abbot of Aberbrothock (Arbroath) had ordered a bell—whence the name of the rock—to be fastened to the reef so as to respond to movements of the waves. This was destroyed by a pirate, whose ship was afterwards wrecked at this very spot, the rover and his men being drowned. Southey made the incident the subject of his ballad of "The Inchcape Rock."

BELLUNO (anc. *Bellunum*), episcopal see, Venetia, Italy, capital of province of Belluno, 54m. north of Treviso by rail and 28m. direct, at confluence of Ardo and Piave, 1,285ft. above sea-level. Pop. (1921) 10,381 (town); 26,753 (commune). It surrendered voluntarily to Venice in 1420 and remained Venetian until 1797. The fine early Lombard Renaissance Palazzo dei Rettori is the seat of the prefecture.

BELLWORT (*Uvularia*), the name given to a group of handsome woodland plants of the lily family, native to eastern North America. There are five or six species, all low perennials with slender, creeping root stocks which send up leafy stems from 6 to 20in. high, bearing large pale yellow flowers, usually solitary and drooping at the ends of the branches, and blooming from April to June. The most conspicuous is the large-flowered bellwort (*U. grandiflora*). This bears ovate leaves somewhat hairy below when young and narrowly bell-shaped, lemon-yellow, six-parted flowers about 1½in. long. It is found from Quebec westward to Minnesota and southward to Georgia and Kansas. The somewhat smaller perfoliate bellwort (*U. perfoliata*), with more pointed leaves, which are smooth below, occurs from Quebec and Ontario south to Florida and Mississippi. In the two foregoing species the leaves appear as if impaled upon the stem (perfoliate). The other much smaller species, by some authorities regarded as belonging to the genus *Oakesia*, have sessile leaves. The sessile-leaved bellwort (*U. sessilifolia*) ranges from New Brunswick to Minnesota and south to Georgia and Arkansas. The mountain bellwort (*U. puberula*) is restricted to the mountains of Virginia, West Virginia and North Carolina, while the delicate *U. floridana* is found only in central Florida.

BELMONT, AUGUST (1816–1890), American banker and financier, was born at Alzei, Rhenish Prussia, on Dec. 8, 1816. He entered the banking house of the Rothschilds at Frankfurt, acted as their agent for a time at Naples, and in 1837 settled in New York as their American representative. In 1853–55 he was chargé d'affaires for the United States at The Hague, and from 1855 to 1858 was the American minister resident there. He energetically supported the Union cause during the Civil War, and exerted a strong influence in favour of the North upon the merchants and financiers of England and France. He died in New York on Nov. 24, 1890.

His son, **PERRY BELMONT** (1851–), was born in New York on Dec. 28, 1851. He practised law in New York for five years, and was a member of Congress from 1881–89, serving in 1885–87 as chairman of the committee on foreign affairs. In 1889 he was United States minister to Spain.

Another son, **AUGUST BELMONT** (1853–1924), was born in New York on Feb. 18, 1853. He was prominent in financing and building the New York subway. He died in New York city on Dec. 10, 1924.

A volume entitled *Letters, Speeches and Addresses of August Belmont* (the elder) was published at New York in 1890.

BELMONT, a residential town of Middlesex county, Massachusetts, U.S.A., on the Boston and Maine Railroad, 6m. W. by N. of Boston, adjoining Cambridge. It was formed from parts of Watertown, Waltham and West Cambridge, and was incorporated in 1859 after a bitter contest through several successive legislatures. Its area is 4.8sq m. The population in 1860 was 1,198; in 1920 it was 10,749; and in 1925, according to the State census, 15,256. The principal villages are Belmont and Waverly. The Massachusetts general hospital in 1876 established its convalescent home on a tract of 114ac. known as Waverly Highlands; and in 1895 the McLean hospital moved to Waverly from Somerville.

BELOIT, a city of Rock county, Wis., U.S.A., on Rock river, 70m. S.W. of Milwaukee, on the southern boundary of the State. It is served by the Chicago and North Western and the Chicago, Milwaukee, St. Paul and Pacific railways. The population was 10,436 in 1900; 21,284 in 1920, of whom 2,819 were foreign-born white; and was estimated at 27,000 in 1927.

The city has a pleasant situation on high bluffs on both sides of the river, which furnishes abundant water-power. The factory products in 1925 were valued at \$28,304,514, and included knives, shoes, steam pumps, engines, windmills, automobile trailers and

various machinery. Beloit college, on a commanding site east of the river, was founded in 1846 through the efforts of the Congregational and Presbyterian churches to meet the educational needs of the new region opened up by the Black Hawk War. It has a campus of 30ac. and a large athletic field, an enrolment of over 500, and an endowment of over \$2,000,000.

Beloit was founded by New Englanders in 1838, and was chartered in 1856.

BELOMACY, a form of divination (q.v.) by means of arrows, practised by the Babylonians, Scythians and other ancient peoples (from *bēlos*, a dart, and *μαντεία* prophecy or divination). Nebuchadrezzar (Ezek. xxi. 21) resorted to this practice "when he stood in the parting of the way . . . to use divination: he made his arrows bright."

BELON, PIERRE (1517–1564), French naturalist, was born near Le Mans (Sarthe). He studied medicine at Paris, where he took the degree of doctor, and then became a pupil of the botanist Valerius Cordus (1515–44) at Wittenberg, with whom he travelled in Germany. Cardinal de Tournon furnished him with means for a scientific journey through Greece, Asia Minor, Egypt, Arabia and Palestine (1546–49). Belon, who was highly favoured both by Henry II. and by Charles IX., was assassinated at Paris in April 1564. His works include: *Les observations de plusieurs singularités et choses mémorables trouvées en Grèce, Asie, etc.* (1553, enlarged ed., Antwerp, 1555); *Histoire naturelle des estranges poissons* (1551), *De aquatilibus* (1553), and *L'Histoire de la nature des oyseaux* (1555). Belon was one of the first workers in the science of comparative anatomy.

BELOW, FRITZ VON (1853–1918), German general, was born on Sept. 23, 1853 at Danzig. He served in the war of 1870–71, and in 1912 was appointed to the command of the XXI. Army Corps. He fought with the VI. Army on the western front at the beginning of the World War, but his corps was transferred in 1915 to the eastern front. In 1916 he was chief in command of the I. Army, which was engaged in Nov. 1916 on the Somme. He died in a field hospital on the western front on Nov. 23, 1918.

BELOW, OTTO VON (1857–), German general, was born at Danzig on June 18, 1857. At the beginning of the World War he was in command of the 2nd Infantry Div at Insterburg in East Prussia. In command of the I. Reserve Corps, he took part in the battles which resulted in the almost complete destruction of the Russian army of the Narev. He was then appointed to the chief command of the VIII. Army, which bore an essential part in the victory over the Russian X. Army at the battles of the Masurian Lakes (Feb. 7–15, 1915). In May 1915 he was placed in chief command of the German Niemen army and pressed forward with it in Courland (Kurland) and Lithuania as far as the southern reaches of the Dvina. In the autumn of 1916 he received the command of the German army group in Macedonia and in the autumn of 1917 was placed in chief command of the XIV. Army, which was fighting against Italy. In 1918 he led the XVII. Army, which particularly distinguished itself in the battles around Arras. After the war he was for a short period general in command of the XVII. Army Corps at Danzig. He resigned in June 1919.

BELPER, urban district, Derbyshire, England, on the river Derwent, seven miles N. of Derby on the L.M.S. railway. Pop. (1921) 12,324. Until 1846 Belper (Beaurepaire) formed part of the parish of Duffield, granted by William I. to Henry de Ferrers, earl of Derby. There is no distinct mention of Belper till 1290 when the manor was held by Edmund Crouchback, earl of Lancaster, who had a hunting seat here named Beaurepaire and founded the chapel of St. John. The manor thus became parcel of the duchy of Lancaster and is supposed to have been the residence of John of Gaunt. It afterwards passed to the Jodrell family. The neighbourhood was severely scourged by the plague of 1609. Coal mining is the most important industry, with metal working, especially the manufacture of all forms of wire, coming second. Hosiery and lace making are also of importance.

BELSHAZZAR, a Babylonian general of the 6th century B.C. Until the decipherment of the cuneiform inscriptions, he was known only from the book of Daniel (v. 2, 11, 13, 18) and its

reproduction in Josephus, where he is represented as the son of Nebuchadrezzar and the last king of Babylon. His identification with Nabonidos, the last Babylonian king according to the native historian Berossus, goes back to Josephus. In 1854 Sir H. C. Rawlinson discovered the name of Bel-sarra-uzur—"O Bel, defend the king"—in an inscription belonging to the first year of Nabonidos which had been discovered in the ruins of the temple of the Moon-god at Muqayyar or Ur. Here Nabonidos calls him his "first-born son." In the contracts and similar documents there are frequent references to Belshazzar, who is sometimes entitled simply "the son of the king."

He was never king himself, nor was he the son of Nebuchadrezzar. Indeed his father Nabonidos (Nabunaid), the 'son of Nabubaladsu-iqhi, was not related to the family of Nebuchadrezzar and owed his accession to the throne to a palace revolution. Belshazzar took command of the army, living with it in the camp near Sippara, and the measures of defence organized against the invasion of Cyrus appear to have been due to him. Hence Jewish tradition substituted him for his less known father, and rightly concluded that his death marked the fall of the Babylonian monarchy. According to the Babylonian Chronicle, from the 7th year of Nabonidos (548 B.C.) onwards "the son of the king" was with the army in Akkad, that is, in the close neighbourhood of Sippara. At an earlier period there is frequent mention of his trading transactions, which were carried out through his house-steward or agent. Thus in 545 B.C. he lent 20 manehs of silver to a private individual, a Persian by race, on the security of the property of the latter.

The legends of Belshazzar's feast and of the siege and capture of Babylon by Cyrus which have come down to us from the book of Daniel and the *Cyropaedia* of Xenophon have been shown by the contemporaneous inscriptions to have been a "projection backwards" of the re-conquest of the city by Darius Hystaspes. The actual facts were very different (see *BABYLONIA: History*). His death subsequent to the surrender of Babylon and the capture of Nabonidos, and with it the last native effort to resist the invader, would account for the position he assumed in later tradition and the substitution of his name for that of the actual king.

See Th. G. Pinches, *P.S.B.A.*, May 1884; H. Winckler, *Zeitschrift für Assyriologie*, ii. 2, 3 (1887); *Records of the Past*, new series, i. p. 22-31 (1888); A. H. Sayce, *The Higher Criticism*, p. 497-537 (1893).

BELT, THOMAS (1832-1878), English geologist and naturalist, was born at Newcastle-on-Tyne, and educated in that city. He spent eight years on the Australian gold fields and some time gold-mining in Nova Scotia, returning to England about 1860. In 1861 he issued a separate work entitled *Mineral Veins: an Enquiry into their Origin, founded on a Study of the Auriferous Quartz Veins of Australia*. He was searching for gold when he investigated the rocks and fossils of the Lingula Flags at Dolgelly, his observations being published in a now classic memoir in the *Geological Magazine* for 1867. He then spent four active and adventurous years in charge of some Nicaraguan mines, the results being given in his *Naturalist in Nicaragua* (1874), a work of high merit. In his scientific papers he dealt boldly and suggestively with the phenomena of the Glacial period in Britain and in various parts of the world. After many further expeditions to Russia, Siberia and Colorado, he died at Denver on Sept. 21, 1878.

BELT, a flat strap of leather or other material, used as a girdle (*q.v.*), especially the *cinctura gladii* or sword-belt, the chief "ornament of investiture" of an earl or knight (O.Ger. *balz*); in machinery, a flexible strap passing round from one drum, pulley or wheel to another, for the purpose of power-transmission (see **BELTING**). The word is applied to the belts of the planet Jupiter, to the armour-belt at the waterline of a warship, or to a narrow tract of country with special distinguishing characteristics, such as the earthquake belt across a continent.

BELTANE, BELTENE, BELTINE or BEAL-TENE (Scot.Gael. *bealltain*), the Celtic name for May-day, on which was held a festival originally common to all the Celtic peoples. The most important ceremony in later centuries was the lighting

of the bonfires known as "beltane fires," which is believed to represent the Druidical worship of the sun-god. He who had the misfortune to get the charcoal-blackened bit of the cake cooked at the fire became *cailleach bealtine* (the beltane carline)—a term of great reproach. In the north-east of Scotland beltane fires were still kindled in the latter half of the 18th century. Cormac, archbishop of Cashel about the year 908, furnishes in his glossary the earliest notice of beltane. (See *Trans. Irish Acad.* xiv. pp. 100, 122, 123.) The Highlanders have a proverb, "He is between two beltane fires."

The derivation of the word beltane is obscure. Following Cormac, it has been usual to regard it as a combination of the name of the god Bel or Baal or Bil with the Celtic *teime*, fire. Theories thereby connecting the Semitic Baal with Celtic mythology are now repudiated by scientific philologists, and the *New English Dictionary* accepts Dr. Whitley Stokes's view that beltane can have no connection with *teime*, fire. Beltane, Hallowmas, Candlemas, and Lammas were in ancient Scotland four quarter days.

For a full description of the beltane celebration in the Highlands of Scotland during the 18th century, see John Ramsay, *Scotland and Scotsmen in the 18th Century* (1888); also J. Robertson in Sinclair's *Statistical Account of Scotland*, xi. 620; Thomas Pennant, *Tour in Scotland* (1769-70); W. Gregor, "Notes on Beltane Cakes," *Folklore*, vi. (1895), p. 2; and "Notes on the Folklore of the North-East of Scotland," p. 167 (*Folklore Soc.* vii. 1881); A. Bertrand, *La Religion des Gaulois* (1897); Jamieson, *Scottish Dictionary* (1808); A. Macbain, *Celtic Mythology and Religion* (1917); Cormac's *Glossary* has been edited by O'Donovan and Stokes (1862).

BELTING FOR POWER TRANSMISSION. The transmission of power from an engine or motor to a machine by the method of driving shaft and pulley demands the employment of belts or ropes of careful manufacture. These are variously of leather, friction surface rubber balata, solid woven cotton and other materials. Despite the advance of electrical power transmission, belt and rope drive is still largely employed, and the manufacture of power-belt is an industry of considerable dimensions. In addition to the selection of the best type of belt for a given type of power transmission from a manufacturing standpoint, other important considerations are belt fastenings, pulleys to be used, stresses and loading under maximum conditions. When the power to be transmitted is not large, round or V-shaped belts are used. Cases of this are seen in the cooling fan and generator of automobiles and transmission drives on motorcycles. Most of the applications in industry, however, are of the leather, rubber, cotton or steel types of flat belt.

LEATHER BELTING

Manufacture of Leather Belting.—The raw material for this article is the product of the heavy-leather tanning industry known as a Strap Butt. The best and most serviceable leather is derived from butts cut from steer hides. The Strap Butt represents approximately 50% of the total weight of leather produced from a hide, and in area is about 4½ by 4½ ft. Rough leather, which is hard, brittle and non-elastic, must be carried to bring it to the pliable condition essential to procure durability, good adhesion to the pulleys and the elasticity required for good power transmission.

In currying, the rough leather is first soaked in a weak tan liquor until the fibres become fairly soft and pliable. At this stage the grain (hair side) and flesh (inside) are thoroughly cleansed from all foreign matter deposited on them during the process of tanning. Subsequently, whilst the leather is in a moist condition, a mixture of best quality cod-liver oil and tallow is well rubbed in on one surface, a dressing of cod oil to the other side, and the butts are hung up to dry. During the drying process the lighter constituents of the grease are absorbed by the fibres. Just before the leather is quite dry the butts are taken down and damped. Another application of grease is given on the opposite side to the first one. At a later stage the butts are "set out," i.e., friction and pressure is applied to the hair side by oscillating or rotary machinery, which extends the leather, works out the grain, and makes the butt as flat as possible. The butt is generally stretched because the elongation of the leather within its elastic limit is of vital importance to its efficient transmission of power.

It is stretched either as a whole or in three sections, the important factor being to leave the leather in the stretching apparatus until it is dry. After stretching and drying, the "belting butt" is put through a finishing process termed "jacking," which smoothes out the leather and gives it a glazed surface. This lends an attractive appearance to the leather but adds nothing to its transmission ability. When the currying is completed the butts are brushed over lightly with warm tallow and laid down in pile to mature. This is of great importance in producing good wearing leather, the time occupied in the whole process of currying and maturing being approximately four months. Before being cut into strips, the curried Strap Butt is finished, *i.e.*, all surplus grease is scraped away and the surfaces are rubbed over to give them a finish.

Hides, and consequently Strap Butt, have both natural and artificial faults. The natural ones are uneven growth, poor texture, and at certain seasons warble holes caused by the "gad" fly. The artificial ones are butchers' cuts, fleshers' galls on the flesh, horn marks and scratches on the grain, all of which must be eliminated from the leather used in the making up of a good, serviceable and reliable belt. The growth of the Strap Butt is very similar to the shape of the steer, that is to say, the thickest parts are over and along the ribs. That portion which covers the spinal region is thinner but sound material, the general thickness tapering from the hind quarters to the commencement of the neck. The best hides for belting are those taken from three-year-old steers and are known as "Green Packer" steer hides. Green hides are best for belting if they are removed from the animals in the fall and winter months. During this period of the year, the hair is shorter and the hide cleaner.

Eliminating Weakness.—The tanner cuts the butts $4\frac{1}{2}$ to $4\frac{3}{4}$ ft. long according to growth, but the difference in thickness between the butt end (hind quarters) and the shoulder end is too great to allow the last 8 to 10 inches at the shoulder end to be used in making a high quality belt. To eliminate this weak spot, therefore, a strip 8 to 10 inches wide is cut away the full width of the butt, which represents a loss of 12% in weight and quite a big loss in value. The shortened butt is now cut into two slightly unequal portions for ease in handling when being cut into strips, which is done on a circular knife running at a high speed.

The cutter carefully examines each portion of the butt for flaws and to ascertain its growth and thickness; the centre portion of the butt, being thinner, produces narrower belting than that portion which covered the centre of the ribs of the steer. From the region two or three inches past the centre line of the ribs to within $1\frac{1}{2}$ to 2 inches of the tip of the butt end flank, the growth falls away and narrower belting is cut; ultimately a piece 3 to 4 inches wide on each portion is left, which is too poor in quality for belting requirements. This represents about 7% of the starting weight of the butt.

The cut lengths are passed forward to the squarer, who examines each one carefully for flaws and thin ends, and decides just where to cut away the leather which is not up to the standard required; in doing so he cuts the ends square, to facilitate the operation of splicing.

Matching the Strips.—In making up a complete roll of belting the strips are carefully matched and graded to ensure that they are of similar texture and as near as possible similar thickness, so that the made-up belt will be well-balanced. When satisfactory in this respect the lengths are spliced, *i.e.*, the ends of each strip are bevelled on alternate surfaces. The bevelled surfaces are roughed up to produce a suitable surface for the cement.

The joints are now fitted, *i.e.*, the bevelled surfaces are carefully measured and marked off to a fixed length which varies according to the width of the strips. The lips are thinned to a feathered edge, great attention being given to ensure that the spliced ends lie and fit properly on each other.

In cementing, a good adhesive gelatine in a warm liquid state is applied and well rubbed into the prepared splices. The covered areas, one spliced from the grain side, the other from the flesh side, are laid on each other, in a hydraulic box-press and pressed down every few minutes till the box is full. Pressure is now left on for several hours to enable the cement to set and also partly dry.

When the boxes are emptied each joint is carefully examined to see that the cement is well set and the lips have a good hold, the whole roll being laid down until the joints are quite dry before they are sewn. In sewing, a white or a horny lace is generally used. The holes are pierced with an awl, and the lace is threaded in and pulled up tight, the whole being a hand operation. Joints are also hemp sewn, both by machine and hand labour. Occasionally copper-wire sewn joints are specified, but copper rivets are not essential, as waterproof joints can be supplied for use in damp situations.

In making "cemented only" belting, a splice about one inch longer than for sewn work is generally made and a higher grade of cement is employed.

In making double belts, two plies are first prepared as single belts with "cemented only" joints, then these two plies are cemented together flesh side to flesh side, and as required are supplied "cemented only," sewn with laces, hemp or copper wire. After the sewing operation the edges of the leather are finished flat or round and the roll which measures generally 300–350 ft. long is ready for use.

A high breaking strain does not mean that the leather will wear well; in fact, the opposite is the case. The hardest wearing leather comes from the centre of the butt, and it is well known that, owing to its close texture, this region of the butt has a comparatively low breaking strain, whereas the outer edges of the butt, which are more open in texture and stretch more, always give a high breaking strain.

Initial Stretch.—The initial stretch in leather belting can be, and is, eliminated by the up-to-date manufacturer, who only leaves just sufficient stretch to provide the elasticity required for good power transmission. The process is, however, expensive and adds to the prime cost of the belting, but in these days of high-speed production the extra outlay for "stretchless" belting is a paying proposition.

Mineral Retanning of Leather.—Leather belting of first quality at its best is sometimes not highly flexible. A certain stiffness, peculiar to the leather, has been overcome by the introduction of the mineral retanning process. This process results in a leather of extreme flexibility, increased tensile strength and increased frictional qualities; it enables it to stand the action of water and steam and, to a certain extent, the effect of corrosive acids.

Leather belts withstand much overloading, but they require some care and attention during their effective life. An occasional application of curriers' dubbin furnishes fresh lubricants to the fibres when they become dry. Belt dressings as sold by the dealer are generally more harmful than useful, while giving temporary release from slipping they make the leather harsh and dry in the long run, and thus shorten its life. Leather belts are long lived and are often repaired again and again. Cases are on record of leather belts which have performed their duty efficiently for 25 to 30 and even 40 years. The best makes of leather belting are sold on a measurement basis, the per foot price-list being graded according to width and thickness. (R. M. O.)

BALATA BELTING

This belting employs balata, a gum obtained from the bullet tree (*Mimusops balata*), which is a native of Guiana and the West Indies. Balata is related to gutta-percha, the latex containing a high proportion of that substance. Its advantages for the purpose of belting are non-elasticity, great power of penetration when in solution (so that the fabric used as a base can be rendered thoroughly waterproof and solid), and tenacity in binding the plies. It offers great resistance to oxidation.

The basis of the balata belt is cotton-duck, necessarily of high grade, for its fibres must withstand the strains of transmission, and be of such evenness of quality and texture that the belt throughout its length and width is of uniform strength and suppleness to ensure true running. American cotton of long staple gives the best results. For the requirements of belting the duck must be both tightly spun and woven. The relation of the strength of the warp to the warp is of considerable importance, for although all the tension in a belt would appear to bear on the warp, yet this

must be strengthened and supported by the web, or the belt will lose its shape, pull narrow and stretch.

The duck is thoroughly impregnated with a carefully cleaned solution of balata. This operation is most important, for the duck must be thoroughly saturated before being made up into belts. After evaporation of the solvent agent, the treated duck is ready for translation into various widths and plies. It is therefore heated to reduce the balata to a partially melted state, and in this condition the duck is folded in the number of plies required under heavy pressure. The belt is then passed through very heavy rollers, and severe tension applied by way of tests. The result is a belt of great tensile strength and true running. An ingenious manufacturer has designed a belt which combines balata with leather. The upper part of the belt is of balata based on cotton-duck as here described; beneath it are transverse strips of oak-tanned leather attached to the balata by strong metal rivets so well sunk into the leather that they do not touch the pulleys. The balata takes the pull, and the leather strips which are attached to it give grip. (X.)

RUBBER BELTING

This type, as it is known in the United States, is composed of cotton duck impregnated with a strong, tenacious, slow-ageing rubber compound. The present methods of manufacture produce a belt, homogeneous, strong, flexible and durable. The rubber friction compound is not merely spread on the surface of the cotton duck, but is forced into the pores by massive calender rollers. Therefore the strength of the finished belt depends upon the strength of its duck, and the strength of the duck is proportioned to its weight and its quality. By weight is meant the actual scale weight of a piece of duck 36 in. by 42 in. when dry. These dimensions are known as "U.S. trade standard." The breaking tensile strength of the average 32 oz. duck 1 in. wide is about 500 lb.; of 28 oz. duck, 440 lb. The duck is first inspected, after which tests are made for tensile strength, crimp, etc. The next step is impregnation of the duck with the rubber compound. Before this can be done the duck must be thoroughly dried as the rubber compound will not adhere to a moist surface. This is accomplished by running it over a series of warm plates or heated rollers. The duck, while warm, is then passed through a calendering machine which compresses the rubber compound into it.

TEXTILE BELTING

This is made by weaving in a loom or building up a belt with layers of canvas stitched together. The success of this type of belting depends upon the weight and grade of cotton duck or other material employed, the method of stitching the duck plies together and the character of the impregnating compounds. In the better grades, the weight of the duck is usually 36 to 37½ oz. to a standard 36 in. by 42 in. strip and possesses a tensile strength of from 550 to 600 lb. per in. per width per ply. There are two general methods of manufacture in use, one known as the round edge and the other as the folded. After the belt is formed and stitched, it is treated with the impregnating compound which makes it water-proof, and in some cases oil-proof. Generally, belts treated with a cheap filling are very stiff and hence do not conform to the pulley, making it more difficult to transmit the desired power. Textile belts are used more for conveyor service than for the transmission of power.

Hair power belting is used where special resistance is required to the action of acids, moisture and oils. Frequently this is made of cotton of the highest grade, having long fibre cotton yarn specially selected, and hair from the long-hair two-humped Bactrian camel of northern China, Mongolia and Siberia. It is woven on looms under tension which results in a closely woven, one-piece fabric, uniform throughout. It is then treated with special compounds for preserving its life and pliability. Prior to weaving, the hair is cleaned and the longest fibres are made up into yarn. The yarn is then rolled on spools into a "beam" which forms the warp of the belt; a cotton filler and binder is used to complete the woven structure.

STEEL BELTING

This type of belt has been used with considerable success in Germany since 1906 but results in the United States have not been as satisfactory. The steel belt is used in the same manner as the leather belt, except that it is narrow, thin and of very light material. It is put on the pulley with a relatively high initial tension and hence runs without sag. The material used is frequently a charcoal steel, prepared and hardened by processes that are for the most part secret. Steel belts are not adapted to tight and loose pulleys, but crossed belts will work satisfactorily, provided the distance between the shafts is held above a certain predetermined ratio to the width of the belt. Sometimes several steel belts are used with one transmission. (W. STA.)

BELTON, a city of Texas, U.S.A., 55m. N.E. of Austin; the county-seat of Bell county. It is on Federal highway 81, and is served by the Santa Fe and the Missouri-Kansas-Texas railways. The population in 1920 was 5,098. Cotton, grain, honey, and hogs are raised in the surrounding country. The city has cotton gins and compresses, cottonseed-oil and cotton-yarn factories, and a poultry-dressing plant. It is the seat of Baylor College for Women, opened at Independence in 1851 as the women's section of Baylor university (chartered in 1845 by the Republic of Texas) and removed to Belton in 1886.

BELTRAMI, EUGENIO (1835-1900), Italian mathematician, was born at Cremona. He came of a well-known and cultured family; was educated at Cremona and later at Pavia, where he studied mathematics under Brioschi. Beltrami held an appointment in the administration of the Italian railways until 1862 when he began his academic career as professor extraordinarius in algebra, and geometry at Bologna. The following year he was appointed professor of geodesy at Pisa, but he returned to Bologna in 1866 as professor of rational mechanics. In 1873 Beltrami became professor at Rome and was elected a member of the Reale Accademia dei Lincei. Between 1876 and 1891 he lectured on mathematical physics and higher mechanics at Pavia, then returned to Rome where he remained until his death, after an unsuccessful operation, on Feb. 18, 1900.

Beltrami's work on non-Euclidean geometry follows on that of Riemann and Lobatchewsky; his most important contributions, dealing with the theory of hyperbolic space, were published in the *Giornale Matematico di Napoli* (1868). He was also the author of papers on differential parameters in which he used the theory of invariants (1869), on flexures of ruled surfaces and on the general theory of surfaces. While at Pavia and Rome Beltrami wrote a number of papers on various branches of mathematical physics such as hydrodynamics, elasticity, physical optics, theory of potential, electricity, magnetism, conduction of heat and thermodynamics. A good deal of this work aims at clearing up some of the obscurities present in Maxwell's work. After his death Beltrami's papers were collected and published under the title *Opere Matematiche* by the University of Rome (3 vols., 1902-10).

BELUGA or "WHITE WHALE" (*Delphinapterus leucas*), a cetacean of the family *Delphinapteridae*. A native of the Arctic seas, it extends in the western Atlantic as far south as the river St. Lawrence, which it ascends for a considerable distance. In colour it is almost pure white; the maximum length is about 18 ft.; and the back-fin is lacking. (See CETACEA.)

BELVEDERE or **BELVIDERE**, an architectural structure built in the upper part of a building or in any elevated position so as to command a fine view. The belvedere assumes various forms, such as an angle turret, a cupola, a loggia or open gallery. The name is applied to the whole building, as the Belvedere gallery in the Vatican at Rome, or the Belvedere palace in Vienna.

BELVIDERE, a city of Illinois, U.S.A., 70m. N.W. of Chicago, on the Kishwaukee river, at an altitude of 800ft.; the county seat of Boone county. It is on Federal highway 20, and is served by the Chicago and North Western railroad, which has here its terminal yards for three divisions. The population in 1920 was 7,804. The fertile river valley produces chiefly grain and hay, and milk for the Chicago market. Manufactures include sewing-machines, washing-machines, industrial alcohol, casket hardware, corsets, overalls, artificial flowers, radios, computing

scales and milk-bottle caps. The municipal water supply comes from artesian wells. Belvidere was founded in 1836 and incorporated in 1852 and again in 1881.

BELZONI, GIOVANNI BATTISTA (1778–1823), Italian explorer of Egyptian antiquities, was born at Padua. He and his wife in 1803 moved to London, where they lived in extreme poverty until they found a livelihood by exhibiting feats of strength at Astley's circus, to which he was introduced by Henry Salt. Belzoni had invented a hydraulic machine and went to Egypt to induce Mohammed Ali to adopt it for the regulation of the Nile waters. In Egypt he was again befriended by Henry Salt, then consul-general, who sent him to Thebes, whence he removed with great skill the colossal bust of Rameses II., commonly called Young Memnon, which he shipped for England, where it is in the British Museum. He investigated the great temple of Edfu, visited Elephantine and Philae, cleared the great temple at Abu Simbel of sand (1817), made excavations at Karnak, and opened up the sepulchre of Seti I. ("Belzoni's Tomb"). He was the first to penetrate into the second pyramid of Giza, and the first European in modern times to visit the oasis of Baharia, which he supposed to be that of Siwa. He also identified the ruins of Berenice on the Red Sea. In 1819 he returned to England, and published, in 1820, his *Narrative of the Operations and Recent Discoveries within the Pyramids, Temples, Tombs, and Excavations in Egypt and Nubia*, etc. In 1823 he set out for West Africa, intending to penetrate to Timbuktu. He reached Benin, but died of dysentery at a village called Gwato on Dec. 3, 1823. In 1829 his widow published his drawings of the royal tombs at Thebes.

BEM, JOSEF (1795–1850), Polish soldier, was born at Tarnow in Galicia, and was educated at the military school at Warsaw. Joining a Polish artillery regiment in the French service, he took part in the Russian campaign of 1812, and brilliantly distinguished himself in the defence of Danzig (Jan–Nov. 1813). On returning to Poland he was for a time in the Russian service, but lost his post, and his liberty as well for some time, for his outspokenness. In the Polish War of Independence his skill as an artillery officer won for the Polish general Skrynecki the battle of Igany (March 8 1831), and he distinguished himself at the indecisive battle of Ostrolenka (May 26). He took part in the desperate defence of Warsaw against Prince Paskievich (Sept. 6–7 1831). Then Bem escaped to Paris, where he supported himself by teaching mathematics. In 1848 he attempted to hold Vienna against the imperial troops, and, after the capitulation, hastened to Pressburg to offer his services to Kossuth. He was entrusted with the defence of Transylvania at the end of 1848, and in 1849, as the general of the Szeklers (q.v.), he performed miracles with his little army, notably at the bridge of Piski (Feb. 9), where, after fighting all day, he drove back an immense force of pursuers. After recovering Transylvania he was sent to drive the Austrian general Puchner out of the Banat of Temesvár. Bem defeated him at Orsova (May 16), but the Russian invasion recalled him to Transylvania. From July 12–22 he was fighting continually, but finally, on July 31 his army was annihilated by overwhelming numbers near Segesvár (Schässburg), Bem only escaping by feigning death. Bem was in command and was seriously wounded in the last pitched battle of the war, fought on Aug. 9 at Temesvár. On the collapse of the rebellion he fled to Turkey, adopted Mohammedanism, and under the name of Murad Pasha served as governor of Aleppo, where, at the risk of his life, he saved the Christian population from being massacred by the Muslims. Here he died on Sept. 16 1850. The tiny, withered, sickly body of Bem was animated by heroic temper. Even the rough Szeklers regarded him with superstitious reverence. A statue to his honour has been erected at Maros-Vásárhely, but he lives still more enduringly in the verses of the patriot poet Sandor Petöfi.

See Johann Czetzy, *Memoiren über Bems Feldzug* (Hamburg, 1850); Kálmán Deresényi, *General Bem's Winter Campaign in Transylvania, 1848–49* (Hung.) (1896).

BEMA, in ecclesiastical architecture, the semi-circular recess or apse (q.v.) in the basilica, where later the altar was placed.

It generally is roofed with a half dome. In early Christian churches the seats of the priests were against the wall, looking into the body of the church, that of the bishop being in the centre. The bema is generally ascended by steps and railed off. In Greece the bema was the general name of any raised platform. Thus the word was applied to the tribunal from which orators addressed assemblies of the citizens at Athens. That in the Pnyx, where the Ecclesia often met, was a stone platform 10 to 11 ft. high. In the Athenian law court counsel addressed the court from such a platform; it is not known whether each had a separate bema or whether there was only one to which each counsel and the witnesses in turn ascended (cf. W. Wyse in his edition of Isaeus, p. 440). Another bema was the platform on which stood the urns for the reception of the bronze discs (*ψήφοι*) by which at the end of the 4th century B.C. the judges recorded their decisions.

BEMBERG, HERMAN (1861–), French musical composer, was born of French parents at Buenos Aires, and studied at the Paris Conservatoire, under Massenet, whose influence, with that of Gounod, is strongly marked in his music. His grand opera *Elaine* was produced at Covent Garden in 1892 and in New York in 1894. Among his songs the dramatic recitative *Ballade du Désespéré* is well known.

BEMBO, PIETRO (1470–1547), Italian cardinal and scholar, was born at Venice. While still a boy he accompanied his father to Florence, and there learnt to love the Tuscan dialect which he afterwards cultivated. He accompanied Giulio de' Medici to Rome, where he was appointed secretary to Leo X. (1513). On the pontiff's death he retired to Padua, and in 1529 he accepted the office of historiographer to his native city, being shortly afterwards appointed librarian of St. Mark's. The offer of a cardinal's hat by Pope Paul III. took him in 1539 again to Rome, where he renounced the study of classical literature and devoted himself to theology and classical history, receiving before long as reward of his conversion the bishoprics of Gubbio and Bergamo. As a writer, Bembo is the *beau idéal* of a purist. The exact imitation of the style of the classics was the highest perfection at which he aimed.

His works (collected edition, Venice, 1720) include a *History of Venice* (1551) from 1487 to 1513, dialogues, poems, and what we should now call essays. Perhaps the most famous are a little treatise on Italian prose and a dialogue entitled *Gli Asolani*, in which platonic affection is recommended, to the amusement of the reader who remembers the relations of the beautiful Morosina with the author. The edition of Petrarch's *Italian Poems* (1501) and the *Terzerime* (1502), both published by Aldus, were edited by Bembo. See *Opere de P. Bembo* (Venice, 1729); Casa, *Vita di Bembo*, in 2nd vol. of his works.

BEMIDJI, a city in the midst of the woods and lakes of northern Minnesota, U.S.A., about 150m. N.W. of Duluth, the county seat of Beltrami county. On Federal highways 2 and 71, and served by the Great Northern, the Soo, the Northern Pacific, and the Minneapolis, Red Lake and Manitoba railways. The population was 2,183 in 1900; 7,086 in 1920; and in 1927 was estimated at 10,000. The city is built around the lower end of Lake Bemidji and bordered on the south by Lake Irving, through both of which the Mississippi river flows from its source in Lake Itasca (within a State park) 25m. to the south-west. It has an altitude of 1,343 feet. It is a distributing and supply point for the lumbering industry of the region, a base for summer excursions, for fishing, and hunting big game. There are saw-mills, box factories, and wood-working mills; cement works and brickyards; woollen mills; creameries; a turpentine plant, and one making peat products. A State teachers college is situated there.

Bemidji is an Indian word meaning "easy crossing," applied to the narrows across the Mississippi between the two lakes, and also the name of a Chippewa chief who was a staunch friend of the early settlers, after whom the city was named.

BEMIS, EDWARD WEBSTER (1860–), American economist, was born at Springfield (Mass.), April 7, 1860, and was educated at Amherst and Johns Hopkins university. He held the professorship of history and political economy in Vanderbilt university (1889–92), was associate professor of political economy in the University of Chicago (1892–95), assistant statistician to

the Illinois bureau of labour statistics (1896), and professor of economics and history in the Kansas State Agricultural college (1897-99). Thereafter he devoted himself to practical rather than theoretical work, ultimately becoming consulting engineer on public utilities, and a member of the advisory board of the valuation bureau of the Interstate Commerce Commission (1913-23). In 1901 he became superintendent of the Cleveland waterworks. He wrote much on municipal government, his more important works being *Municipal Ownership of Gas-Works in the United States* (1891) and *Municipal Monopolies* (1899).

BÉMONT, CHARLES (1848-), French scholar, and director of the École des Hautes Études in Paris, was born in Paris, on Nov. 16, 1848. His studies were chiefly in English and European mediaeval history, his most important works being: *Simon de Montfort, comte de Leicester* (1884); *Les chartes des libertés anglaises* (1892); *Recueil d'actes relatifs à l'administration des rois d'Angleterre en Guyenne au XIII siècle. . . . Transcrits et publiés par C. Bémont* (1914). In 1896 Bémont published a supplement to the first volume of the *Gascon Rolls*, begun by F. Michel, and in 1900 and 1906 he issued the second and third volumes. The University of Oxford conferred the honorary degree of Litt D. on him in 1909.

BEN, in the Scottish phrase "a but and a ben," the inner room of a house in which there is only one outer door, so that the entrance to the inner room is through the outer, the but (O.E. *benman* within, and *butan*, without). Hence "a but and a ben" meant originally a living room and sleeping room, and so a dwelling or a cottage.

BENARES, an Indian State attached to the United Provinces; area 875 sq.m., and pop. 362,735 in 1921. This is the latest Indian State to be so constituted, the maharajah having been given powers as a ruling chief in 1911. His ancestor, Balwant Singh, although nominally an ordinary landholder, succeeded in establishing his independence of the Oudh court, and helped the British at the battle of Buxar. His son was the famous Chet Singh, whose differences with Warren Hastings are familiar matters of history. Chet Singh's nephew was reinstated by the East India company; the tracts which had been under the family's management on behalf of the Oudh wazirs were taken over by the British, and the raja was confirmed in the possession of what long continued to be known as the "family domains," for which Balwant Singh had received a grant from the Delhi emperor. The immediate predecessor to the present chief was staunch to the British cause in the Mutiny; and the status of the family in relation to their own properties steadily approximated to that of an independent prince. The personal character, loyalty and munificence of the present maharaja ultimately turned the scale; and in 1910 his property was formally recognized as an Indian State. The maharaja has a personal salute of 15 guns (13 hereditary), and owns outside his territory large estates as an ordinary landholder in adjoining districts in the United Provinces and Bihar.

The capital of the State is Ramnagar (pop. 10,723 in 1921), a small town with a fine fort on the river, which is the maharaja's palace. The view from it down to the river front of Benares city is magnificent. The town was transferred to the State at a later date than the outlying lands, after having been greatly improved by the maharaja at his own cost. A Brahman himself and a patron of learning, the maharaja presented the Hindu university with the site of its buildings opposite Ramnagar, as well as with a handsome endowment.

BENARES or **KASI**, the holy city of the Hindus, which gives its name to a district and division in the United Provinces of India. It ranks in the affection and reverence of the Hindus as Mecca does for the Muslims: and to western eyes its great antiquity and its unique picturesqueness invest it with an interest all its own. Hsüan Tsang, the celebrated Chinese pilgrim, visited Benares in the 7th century A.D. and described it as containing 30 Buddhist monasteries, with about 3,000 monks, and about 100 temples of Hindu gods. Hinduism has long supplanted Buddhism, and the modern temples number upwards of 1,500. The Ganges here forms a fine sweep of about 4m. in length, the city rising on the high northern bank on the outside of the curve, and forming

a magnificent panorama of buildings in many varieties of oriental architecture with the minarets of the mosque of Aurangzeb towering above all. The bank of the river is entirely lined with stone, and there are many very fine ghats or landing-places built by pious devotees, and highly ornamented. These are generally crowded with bathers and worshippers, who come to wash away their sins in the sacred river Ganges; and among them constantly

BATHERS AT THE MANIKARNA GHAT, OR LANDING PLACE, IN BENARES Benares with its 1,500 temples, and its picturesque situation on the great Ganges river, has a solemnity unmatched by any city in the world. It is annually visited by thousands of Hindu pilgrims who come to wash away their sins in the sacred river. Near the Manikarna Ghat is the well said to have been dug by Vishnu, the second person of the Hindu trinity

risks the smoke of funeral pyres, for to the pious Hindu death on the bank of the stream is the door to salvation. Shrines and temples, and palaces belonging to great Hindu nobles and princes rise tier over tier from the water's edge; but few of the present buildings are of high antiquity. Among the most conspicuous are the mosque of Arangzeb, built in the middle of the Hindu quarter; the Bisheshwar or Golden Temple, important less through architectural beauty than through its rank as the holiest spot in the holy city; and the Durga temple, which, like most of the other principal temples, is a Mahratta building of the 17th century. The temples are mostly small, placed in the angles of the streets, under the shadow of the lofty houses; and many of them are covered with beautiful and elaborate carvings of flowers, animals and palm branches. The observatory of Raja Jai Singh is a notable building of the year 1693. The internal streets of the town are so winding and narrow that there is not room for a carriage to pass, and it is difficult to penetrate them even on horseback. The level of the roadway is considerably lower than the ground-floors of the houses, which have generally arched rooms in front, with little shops behind them, and above these they are richly embellished with verandahs, galleries, projecting oriel windows, and very broad overhanging eaves supported by carved brackets. The houses are often painted a deep red and covered with pictures of flowers, men, women, bulls, elephants and gods and goddesses in all the many forms known in Hindu mythology.

The sacred area of Benares is bounded by a road 50m. in circuit, which it is the hope of every Hindu to tread once in his life. Many thousands make the pilgrimage every year, after bathing in the sacred river. Besides the immense resort to Benares of poor pilgrims from every part of India, as well as from Tibet and Burma, numbers of rich Hindus in the decline of life go there for religious salvation. These devotees lavish large sums in indiscriminate charity, and it is the hope of sharing in such pious distributions that brings together a repulsive concourse of religious

mendicants from all quarters of the country, many of them deformed, as a voluntary badge of their calling, by every form of physical distortion. At the other extreme of the human scale are large numbers of Brahmans of noted sanctity and learning, to whose feet flock disciples from all over India, and who make Benares the most famous centre of Sanskrit studies.

The city had a population in 1921 of 198,447. The European quarter lies west of the native town, on both sides of the river Barna. Here is the cantonment of Sikraul, no longer of much military importance, and the suburb of Sigra, the seat of the chief missionary institutions. The principal modern buildings are the Prince of Wales' hospital (commemorating the visit of King Edward VII. to the city in 1876), the town hall and the old Mint now occupied by the maharajah. The Benares college, including a first-grade and a Sanskrit college, was opened in 1791, but its fine buildings date from 1852. The Central Hindu college was opened in 1898, and was moved some 20 years later to a fine site on the river opposite Ramnagar. The buildings erected there are now the home of the Benares Hindu university, the first private and sectarian university to be established by law in India. Benares is well served by rail, and is a busy trading centre. Its chief manufactures are silk brocades, gold and silver thread, gold filigree work, German-silver work, embossed brass vessels and lacquered toys; but the brasswork for which it used to be famous has greatly degenerated.

The Hindu kingdom of Benares is said to have been founded by Kas Raja about 1200 B.C. Subsequently it became part of the kingdom of Kanauj, which in A.D. 1193 was conquered by Mohammed of Ghor. On the dismemberment of the Delhi empire, it was seized by Safdar Jang, the nawab wazir of Oudh, by whose grandson it was ceded to the East India company by the treaty of 1775.

The DISTRICT OF BENARES extends over both sides of the Ganges and has an area of 1,008 square miles. The surface of the country is remarkably level, with numerous deep ravines in the calcareous conglomerate. The soil is a clayey or a sandy loam, and very fertile except where there is a saline efflorescence known as *reh* or *usar*. The principal rivers are the Ganges, Karamnasa, Gumti and Barna. The principal crops are barley, rice, wheat, other food-grains, pulse, sugar-cane and (formerly) opium. The population in 1921 was 901,312.

The DIVISION OF BENARES has an area of 10,431 sq. m., and comprises the districts of Benares, Mirzapur, Jaunpur, Ghazipur and Ballia. In 1921 the population was 4,443,898.

BENAVENTE Y MARTÍNEZ, JACINTO (1866–), Spanish playwright and critic, was born in Madrid, the son of a physician. He entered the law faculty of the university there, but, preferring literature, left without taking a degree. His first critical work was *Letters of Women* (1893) which he followed up with the comedy *El Nido Ajeno* (1894). He came under the influence of the French theatre for a brief time, but soon distinguished himself by originality, imagination and purity of style. His light and elegant comedies were at first criticized as deficient in action, merely satirical dialogues aimed against society. When his first comedy was produced the Spanish stage was monopolized by the Basque, José Echegaray (q.v.), but Benavente soon proved his superiority and took his place. His dialogue is brilliant, his characters true to life and the action never flags.

Several of Benavente's plays have been translated into various foreign languages and produced in remote parts of the world. He himself travelled through the United States and Spanish America superintending the execution of his plays by a company formed under his own eye. In 1922 he received the Nobel prize for literature.

Among his most notable plays are *Vested Interests* (1907), *Saturday Night* (1903), *Brute Force* (1908), *The Vulgar* (1901), *The Mistress of the House* (1901) and *The Rose of Autumn* (1905).

BENBOW, JOHN (1653–1702), English admiral, the son of a tanner in Shrewsbury, went to sea when very young, and served in the navy (1678–81). On the accession of William III. he re-entered the navy as a lieutenant and was rapidly promoted. After taking part in the bombardment of St. Malo (1693), and

superintending the blockade of Dunkirk (1696), he sailed in 1698 for the West Indies, where he compelled the Spaniards to restore two vessels belonging to the Scottish colonists at Darien (see PATERSON, WILLIAM) which they had seized. On his return he was appointed vice-admiral, and was frequently consulted by the king. In 1701 he was sent again to the West Indies as commander-in-chief. On Aug. 19 1702, when cruising with a squadron of seven ships, he sighted, and chased four French vessels commanded by M. du Casse near Santa Marta. Admiral Benbow's captains were mutinous, and he was left unsupported in his flagship the "Breda." His right leg was shattered by a chain-shot, despite which he remained on the quarter-deck till morning, when the flagrant disobedience of the captains under him, and the disabled condition of his ship, forced him reluctantly to abandon the chase. After his return to Jamaica, where his subordinates were tried by court-martial, he died of his wounds on Nov. 4, 1702. A great deal of legendary matter has collected round his name, and the facts of his life are obscure.

See Yonge's *Hist. of the British Navy*, vol. i.; Campbell's *British Admirals*, vol. iii., also Owen and Blakeway's *History of Shrewsbury*.

BENCH, a long narrow wooden seat for several persons, with or without a back. While the chair was yet a seat of state or dignity the bench was ordinarily used by the commonalty. It is still extensively employed for other than domestic purposes, as in schools, churches and places of amusement. Bench or Banc, in law, originally was the seat occupied by judges in court; hence the term is used of a tribunal of justice itself, as the King's Bench (q.v.) the Common Bench, and is now applied to judges or magistrates collectively as the "judicial bench," "bench of magistrates." The word is also applied to any seat where a number of people sit in an official capacity, or as equivalent to the dignity itself, as "the civic bench," the "bench of aldermen," the "episcopal bench," the "front bench," i.e., that reserved for the leaders of either party in the British House of Commons.

BENCH MARK, a surveyor's mark cut in stone or some durable material to indicate a point in a line of levels for the determination of altitudes over a given district. The name is taken from the "angle-iron" which is inserted in the horizontal incision as a "bench" or support for the levelling staff. The mark of the "broad arrow" is generally incised with the benchmark so that the horizontal bar passes through its apex.

BENCH TABLE, the stone seat which sometimes runs round the walls and the piers of large churches; it often occurs in porches.

BENCKENDORFF, ALEXANDER, COUNT (1840–1917), Russian diplomat, began his career as an attaché in Florence, proceeding thence to Rome. In 1897 he was appointed minister in Copenhagen, and remained there until 1903, when he was promoted to the Court of St. James. The atmosphere, at the time, was unfavourable to an Anglo-Russian *rapprochement*. But on the conclusion of the secret convention at Bjorko (1905) between Wilhelm II and Nicholas II, which was likely to disrupt the Franco-Russian Alliance and so involve Russia in a continental league against England, Count Benckendorff was invited to Copenhagen and served as a confidential intermediary between Russia and Great Britain. The Bjorko intrigue evaporated without leaving any tangible result, and the historic *rapprochement* between Great Britain, France and Russia took its course. Benckendorff made his home in London where he died Jan. 11 1917.

BEND, a city in the central part of Oregon, U.S.A., on the Deschutes river, 130 m. S.E. of Portland; the county seat of Deschutes county. It is on Federal highway 97, and is served by the Spokane, Portland and Seattle and the Union Pacific railways. The population was 536 in 1910; 5,415 in 1920; and was estimated locally at 10,000 in 1928. Bend is the shipping and trading centre of a lumbering region and an irrigated district which produces wool, poultry, dairy and beef-cattle, as well as hay, alsike clover seed and other crops. It has lumber-mills and box factories, a creamery, iron foundries and machine shops, brick and tile yards. There are interesting caves in the vicinity, one of which formerly supplied the city with ice. Popular lake resorts

in the Cascades are easily accessible, and 125m. S. is the eastern entrance to the Crater national park.

BEND, (1) a bending or curvature (Old Eng. *bendan*) as in "the bend of a river," or technically the ribs or "wales" of a ship. (2) A nautical term for a knot (Old Eng. *bindan*, to bind). (3) A term of heraldry (*q.v.*) signifying a diagonal band or stripe across a shield from the dexter chief to the sinister base (Old Fr. *bende*, a ribbon). In tanning, the half of a hide from which the thinner parts have been trimmed away, "bendleather" being the thickest and best sole-leather.

BENDA, the name of a family of Czech musicians, of whom the most important is Jiří who was a pupil of his elder brother, František (1709–1786), *Concertmeister* in Berlin. Jiří Benda, the violinist, was a famous clavier player and oboist, who was born on June 30, 1722, and died on Nov. 6, 1795. He played in the royal orchestra at Berlin, and in 1748 became *Kapellmeister* to the duke of Gotha, but his chief interest for modern musical history lies in his melodramas. Being a far more solid musician than Rousseau he deserves the title of the musical pioneer of that art-form (*i.e.*, the accompaniment of spoken words by illustrative music) in a sense which cannot be claimed for Rousseau on the strength of his *Pygmalion*. Benda's first melodrama, *Ariadne auf Naxos*, was written in 1774 after his return from a visit to Italy. He was a voluminous composer, also of masses, cantatas and operettas. Mozart's imagination was much fired by Benda's new vehicle for dramatic expression, and in 1778 he wrote to his father with the greatest enthusiasm about a project for composing a duodrama on the model of Benda's *Ariadne auf Naxos* and *Medea*.

BENDA, JULIEN (1868–), French essayist and novelist, was born in Paris on Dec. 26, 1868. His first work appeared in 1898, a commentary on the Dreyfus affair, published in the *Revue Blanche*. He contributed to *Cahiers de la Quinzaine* by Charles Péguy. His first important work is *L'Ordination* (1912), an analytical novel, profound and concise, reminiscent of Benjamin Constant's *L'Adolphe*, but his chief claim to notice is his systematic opposition to the Bergsonian philosophy (*Le Bergsonisme*, 1912; and *Sur le Succès du Bergsonisme*, 1917). In his eyes this doctrine was the apotheosis of irrational instincts or the mere reactions of the senses; he countered it with a conceptualist rationalism, in the manner rather of the French aetiologists than of the great traditional philosophers. His most important work is the *Trahison des Clercs* (1927)—an indictment against the prostitution of intelligence in the service of political passions, which he considers real moral treason. This brilliant pamphlet made a great impression at the time of its publication.

BEN DAY PROCESS, a medium invented about 1879 by Benjamin Day for use in photomechanical engraving for adding tints, shading or stippling to line engravings. Its use eliminates the shading of a drawing by hand and, being mechanical, it avoids the irregularities of hand-drawn work. A numerous and varied selection of mediums, including straight, wave, curved and graduated-line tints; grain stipples and textures; and hand and mechanical-stipples, are available. The drawing, executed in all particulars as for reproduction as a line engraving, that is, drawn in India ink upon a white background, is photographed by the photo-engraver and a negative of the ultimate size of the engraving secured. From this negative a faint image is printed upon the sensitized zinc. Areas not to have Ben Day are painted out on the zinc with gum gamboge. The Ben Day medium, which is in relief, is inked with acid-resisting ink and printed upon the zinc. The zinc is now washed with water to remove the gamboge and then etched in the regular way. When several different tints and shadings are required on a single engraving, each required tint must be separately inked and printed on the zinc, the engraver covering up such areas where the shading is not to print. The ordinary method of indicating on the drawing the portions to be shaded is to paste a transparent flap upon it and mark the areas of each Ben Day with coloured crayon, although where only one tint is to be used the drawing itself is sometimes marked with a light blue wash. A more unusual use of Ben Day is the making of a set of four-line engravings from a single black and white drawing, setting up the

tints in such a way that when each separate engraving is printed progressively, one upon the other, with blue, yellow, red and black inks, a coloured illustration is secured which somewhat resembles, but does not equal, four-colour process printing.

BENDER: see TIGHINA.

BENDIGO (formerly Sandhurst), a city in Victoria (Australia) situated on the flank of the Great Divide c. 100 m. N.N.W. of Melbourne. In 1851 alluvial gold was discovered on a sheep-run and the richness of the finds rapidly attracted population. In 1853 some three million pounds' worth of gold was obtained. Later the quartz reefs, which everywhere intersect the country as ridges and rises, were attacked. Characteristic of the Bendigo field, which is 15 m. by 3 m., or 45 sq.m. in extent, are the saddle reefs, caused by the corrugation of the Ordovician slates and sandstones, in two opposite directions (north-south, east-west) and the filling in of the dome-shaped cavities with auriferous quartz. The "caps" of these reefs—*i.e.*, the portions forming the saddle "seat" or "centre country"—are 29–50 ft. wide, may continue along the axis for 20 m. or more, and have a vertical thickness of 20–30 ft. The "legs" on the reefs taper obliquely downwards for about 100 ft and are 3–4 ft. across. Saddles occur one under another, as many as 24 having been found in 2,200 ft. The ores are not high-grade, but the great bulk available, improved mining and milling technique and an assured and cheap supply of water, have made working continuous and it is now conducted at deep levels (53 shafts over 2,000 ft.; several over 4,000 ft., one said to be the deepest gold mine in the world, 4,614 ft.). Some 20 million oz. (£80 million) have been obtained (1925: 17,700 oz. = c. £70,000). Bendigo, created a city in 1871, is a well-ordered and dignified town (pop., 1926, 33,550). Besides mining, foundries, potteries, tanneries and numerous smaller factories and railway works exist. The climate (mean ann. temps. 70°–45° F; average ann. rainfall 21.5 in., with marked dry period in Jan., Feb., March) is suitable for fruit, vegetable and vine-growing. Bendigo is, therefore, a flourishing market centre, and sends early fruit and vegetables to Melbourne (101 m. by rail). In early days mining was often hampered by lack of water, but large-scale conservation works (Coliban river and reservoirs at Malmesbury) have, since 1870, provided a plentiful supply.

BENDL, KAREL (1838–1897), Bohemian composer, was born on April 16, 1838, at Prague. He studied at the organ school, and in 1858 had already composed a number of small choral works. In 1861 his *Poletuje holubice* won a prize and at once became a favourite with the local choral societies. In 1864 Bendl went to Brussels, where for a short time he held the post of second conductor of the opera. After visiting Amsterdam and Paris he returned to Prague. Here in 1865 he was appointed conductor of the choral society known as *Hlahol*, and he held the post until 1879, when Baron Dervies engaged his services for his private band. Bendl's first opera *Lejla* was produced in 1868. It was followed by *Břetislav a Jitka* (1870), *Starý Ženich*, a comic opera (1883), *Karel Skřeta* (1883), *Dítě Tábora*, a prize opera (1892), and *Máti Mila* (1891). Other works by Bendl are *Indická Princezna*, an operetta (1877), *Cernohorci*, a prize opera (1881), *Čarovný Květ* (1875). Bendl published a mass in D minor for male voices and another mass for a mixed choir; two songs to *Ave Maria*; a violin sonata and a string quartet in F; and a quantity of songs and choruses in the national style. Bendl helped Dvořák in his early days by lending him scores which he was too poor to buy. He died on Sept. 20, 1897, at Prague.

BENEDEK, LUDWIG, RITTER VON (1804–1881), Austrian general, was born at Ödenburg in Hungary on July 14, 1804, his father being a doctor. He received his commission in the Austrian army as ensign in 1822, and rose rapidly in the service. He distinguished himself in the campaigns of Galicia (1846), Italy (1847–48), and Hungary (1849). In the Hungarian campaign he served on Radetzky's (*q.v.*) staff. In the war of 1859 in Italy, Benedek commanded the VIII. corps, and at the battle of Solferino was in command of the right of the Austrian position. That portion of the struggle which was fought out between Benedek and the Piedmontese army is sometimes called the battle of San Martino. Benedek covered the retreat of the rest of the Austrian

army to the Mincio. His reputation was now at its highest, and his great popularity was enhanced, in the prevailing discontent with the reactionary and clerical government of previous years, by the fact that he was a Protestant and not of noble birth. He was promoted *Feldzeugmeister* and in 1860 appointed quartermaster-general to the army, and soon afterwards governor-general and commander-in-chief in Hungary, in succession to the archduke Albert. In 1861 he was made commander-in-chief in Venetia and the adjoining provinces of the empire. In 1864 he resigned the quartermaster-generalship and devoted himself exclusively to the command of the army in Italy. In 1861 he had been made a life-member of the house of peers. In 1866 war with Prussia and with Italy became imminent. Benedek was appointed to command the Army of the North against the Prussians, the control of affairs in Italy being taken over by the archduke Albert. For the story of the campaign of Königgrätz, in which the Austrians under Benedek's command were decisively defeated, see *SEVEN WEEKS' WAR*. Benedek took over his new command as a stranger to the country and to the troops. Only the personal command of the emperor and the requests of the archduke Albert prevailed upon him to "sacrifice his honour." When he took the field his despondency was increased by the passive obstruction he met with amongst his officers, and by the unpreparedness which he found existing at the front. Further his assistants, Lieutenant Field Marshal von Henikstein, and Major-General Krismanić in particular, endeavoured to control Benedek's operations in the spirit of the 18th-century strategists. Under these circumstances, and against the superior numbers, moral and armament of the Prussians, the Austrians were foredoomed to defeat. A series of partial actions convinced Benedek that success was unattainable, and he telegraphed to the emperor advising him to make peace; the emperor refused on the ground that no decisive battle had been fought; Benedek, thereupon, instead of retreating across the Elbe, determined to bring on a decisive engagement, and took up a position with the whole of his forces near Königgrätz with the Elbe in his rear. Here he was completely defeated by the Prussians on July 3, but they could not prevent him from making good his retreat over the river in magnificent order on the evening of the battle. He conducted the operations of his army in retreat up to the great concentration at Vienna under the archduke Albert, and was then suspended from his command and a court-martial ordered; the emperor, however, in December determined that the inquiry should be stopped. Benedek from this time lived in absolute retirement, and having given his word of honour to the archduke Albert that he would not attempt to rehabilitate himself before the world, he published no defence of his conduct, and even destroyed his papers relating to the campaign of 1866. This attitude of self-sacrificing loyalty he maintained even when on Nov. 8, 1866, the official *Wiener Zeitung* published an article in which he was made responsible for all the disasters of the war. The history of the campaign from the Austrian point of view as at present known leaves much unexplained, and the published material is primarily of a controversial character. There can be little doubt that Benedek was the victim of political necessities, perhaps of court intrigues. For the rest of his life he lived at Graz, where he died on April 27, 1881.

See H. Friedjung, *Benedeks nachgelassene Papiere* (Leipzig, 1901, 3rd and enlarged ed., 1904), and *Der Kampf um die Vorherrschaft in Deutschland 1859-1866* (Stuttgart, 1897; 6th ed., 1904-05); V. Schlichtling, *Moltke und Benedek* (1900); A. Krauss, *Moltke, Benedek und Napoleon* (1901); and a roman à clé by Gräfin Salburg, entitled *Königsglaube* (Dresden, 1906). The brief memoir in *Allgemeine deutsche Biographie* represents the court view of Benedek's case.

BENEDETTI, VINCENT, COUNT (1817-1900), French diplomatist, was born at Bastia, Corsica, on April 20, 1817. In the year 1840 he entered the service of the French foreign office. He spent eight years in Egypt, being appointed consul in 1845; in 1848 he was made consul at Palermo, and in 1851 he became first secretary of embassy at Constantinople. For 15 months during the progress of the Crimean War he acted as chargé d'affaires. In the second volume of his essays he gives some recollections of his experiences in the East, including an account of Mohammed Ali, and a (not very friendly) sketch of Lord Strat-

ford de Redcliffe. In 1855 he was employed in the foreign office at Paris, and acted as secretary to the congress at Paris (1855-56). During the next few years he was chiefly occupied with Italian affairs, in which he was much interested. Chosen in 1861 to be the first envoy of France to the king of Italy, he resigned his post the next year, when the anti-Italian party began to gain the ascendancy in Paris. In 1864 he was appointed ambassador at the court of Prussia.

Benedetti remained in Berlin till the outbreak of war in 1870, and during these years he played an important part in the diplomatic history of Europe. His position was a difficult one, for Napoleon did not keep him fully informed as to the course of French policy. In 1866, during the critical weeks which followed the attempt of Napoleon to intervene between Prussia and Austria, he accompanied the Prussian headquarters in the advance on Vienna, and during a visit to Vienna he helped to arrange the preliminaries of the armistice signed at Nikolsburg. It was after this that he was instructed to present to Bismarck French demands for "compensation," and in August, after his return to Berlin, as a result of his discussions with Bismarck, a draft treaty was drawn up, in which Prussia promised France her support in the annexation of Belgium. This treaty was never concluded, but the draft, which was in Benedetti's handwriting, was kept by Bismarck and, in 1870, a few days after the outbreak of the war, was published by him in *The Times*. During 1867 Benedetti was much occupied with the affair of Luxembourg. In July 1870, when the candidature of the prince of Hohenzollern for the throne of Spain became known, Benedetti was instructed by the duc de Gramont to present to the king of Prussia, who was then at Ems, the French demands, that the king should order the prince to withdraw, and afterwards that the king should promise that the candidature would never be renewed. This last demand Benedetti submitted to the king in an informal meeting on the promenade at Ems, and the misleading reports of the conversation which were circulated were the immediate cause of the war which followed, for the Germans were led to believe that Benedetti had insulted the king, and the French that the king had insulted the ambassador. Benedetti was severely attacked in his own country for his conduct as ambassador, and the duc de Gramont attempted to throw upon him the blame for the failures of French diplomacy. He answered the charges brought against him in a book *Ma Mission en Prusse* (1871), which still remains one of the most valuable authorities for the study of Bismarck's diplomacy. In this Benedetti successfully defends himself, and shows that he had kept his government well informed; he had even warned them a year before as to the proposed Hohenzollern candidature. Even if he had been outwitted by Bismarck in the matter of the treaty of 1866, the policy of the treaty was not his, but was that of E. Drouyn de Lhuys. The idea of the annexation of part of Belgium to France had been suggested to him first by Bismarck; and the use to which Bismarck put the draft was not one which he could be expected to anticipate, for he had carried on the negotiations in good faith. After the fall of the Empire he retired to Corsica. He lived to see his defence confirmed by later publications, which threw more light on the secret history of the times. He published in 1895 a volume of *Essais diplomatiques*, containing a full account of his mission to Ems, written in 1873; and in 1897 a second series dealing with the Eastern question. He died on March 28, 1900, while on a visit to Paris. He received the title of count from Napoleon.

(J. W. H.)

BENEDICT (Benedictus), the name taken by 14 of the popes.

Benedict I. succeeded John III. and was pope from 575 to 579, during the incursions of the Lombards and the series of plagues and famines which followed these invasions.

Benedict II. was pope from 684 to 685. He succeeded Leo II. but his ordination was delayed for some months until the leave of the emperor Constantine was obtained.

Benedict III. was pope from 855 to 858. He was chosen by the clergy and people of Rome, but the election was not confirmed by the emperor, Louis II., who appointed an anti-pope, Anastasius (the librarian). The imperial government at length recognized Benedict and discontinued its opposition. The mythical pope Joan is usually placed between Benedict and his predecessor Leo IV.

Benedict IV. was pope from 900 to 903.

Benedict V. was pope from 964 to 965. He was elected by the Romans on the death of John XII. The emperor Otto I. did not approve of the choice and carried off the pope to Hamburg, where he died.

Benedict VI. was pope from 972 to 974. He was installed pope under the protection of the emperor Otto the Great. On the death of the emperor the turbulent citizens of Rome renewed their outrages, and the pope himself was strangled by order of Crescentius, the son of the notorious Theodora, who replaced him by a deacon called Franco who took the name of Boniface VII.

Benedict VII. was pope from 974 to 983. He was elected through the intervention of a representative of the emperor, Count Sicco, who drove out the intruder Franco (afterwards Pope Boniface VII.). Benedict governed Rome quietly for nearly nine years, a somewhat rare thing in those days.

Benedict VIII., pope from 1012 to 1024, was called originally Theophylactus. He was a layman, a member of the family of the count of Tusculum, and was opposed by an anti-pope, Gregory; but defeated him with the aid of King Henry II. of Saxony, whom he crowned emperor in 1014. In his pontificate the Saracens began to attack the southern coasts of Europe and effected a settlement in Sardinia. The Normans also then began to settle in Italy, but their relations with Benedict were friendly. In Italy Benedict supported the policy of the emperor Henry II., and at the Council of Pavia (1022) exerted himself in favour of ecclesiastical discipline.

Benedict IX., pope from 1033 to 1056, son of Alberic, count of Tusculum, and nephew of Benedict VIII., was also called Theophylactus. He was installed pope at the age of 12 through the influence of his father. The disorders of his conduct, though tolerated by the emperors, Conrad II. and Henry III., at length disgusted the Romans, who drove him out in 1044 and appointed Silvester III. his successor. Silvester remained in the papal chair but a few weeks, as the people of Tusculum quickly recovered their influence and reinstated their pope. Benedict, however, sold his rights to his godfather, the priest Johannes Gratianus, who was installed under the name of Gregory VI. (1045). The following year Henry III. obtained, at the Council of Sutri, the deposition of the three competing popes and replaced them by Suidger, bishop of Bamberg, who took the name of Clement II. But before the close of 1047, Clement II. died, and Benedict was reinstated for the third time. At last, on July 17, 1048, the marquis of Tuscany drove him from Rome, where he was never seen again.

Benedict X. (Johannes "Mincius," *i.e.*, the lout or dolt, bishop of Velletri) was pope from 1058 to 1059. He was elected on the death of Stephen IX. through the influence of the Roman barons, who, however, had pledged themselves to take no action without Hildebrand, who was then absent from Rome. Hildebrand put forward an opposition pope in the person of Gerard, bishop of Florence (pope as Nicholas II.) whom he supported against the Roman aristocracy. With the help of the Normans, Hildebrand seized the castle of Galeria, where Benedict had taken refuge, and degraded him to the rank of a simple priest.

Benedict XI. (Niccolo Boccasini), pope from 1303 to 1304, the son of a notary, was born in 1240 at Treviso. Entering the Dominican order in 1254, he became lector, prior of the convent, provincial of his order in Lombardy, and in 1296 its general. In 1298 he was created cardinal priest of Santa Sabina, and in 1300 cardinal bishop of Ostia and Velletri. He was a loyal supporter of Boniface VIII. in his struggle with Philip the Fair of France, and in 1302 he was papal legate in Hungary. On Oct. 22, 1303, he was unanimously elected pope. He did much to conciliate the enemies made by his predecessor, notably France, the Colonnas

and King Frederick II. of Sicily: nevertheless on June 7, 1304, he excommunicated William of Nogaret and all the Italians who had captured Boniface in Anagni. Benedict died at Perugia on July 7, 1304; if he was really poisoned, suspicion would fall primarily on Nogaret. His successor, Clement V., transferred the papal residence to Avignon. Among Benedict's works are commentaries on part of the Psalms and on the Gospel of Matthew. His beatification took place in 1733.

See C. Grandjean "Registres de Benoît XI." (Paris, 1883 ff.), *Bibliothèque des Écoles françaises d'Athènes de Rome*.

Benedict XII. (Jacques Fournier), pope from 1334 to 1342, was born at Saverdun on the Arriège. Entering the Cistercian cloister, Bolbonne and graduating doctor of theology at Paris, he became, in 1311, abbot of Fontfroide, in 1317 bishop of Pamiers, and in 1327 of Mirepoix. Created cardinal priest of Santa Prisca, in Dec. 1327, by his uncle John XXII., he was elected his successor on Dec. 20, 1334. Benedict made appointments carefully, reformed monastic orders and consistently opposed nepotism. Unable to remove his capital to Rome or to Bologna, he began to erect a great palace at Avignon. He was a learned theologian, and in 1336 he declared that souls of saints may attain the fullness of beatific vision *before* the last judgment. In 1339 he entered upon fruitless negotiations for the reunion of the Greek and Roman churches. French influence made futile his attempt to come to an understanding with the emperor Louis the Bavarian, who had been excommunicated by John XXII. for stirring up sedition in Italy. He died on April 25, 1342.

Benedict XIII. (Pedro de Luna) (c. 1328–1422 or 1423), anti-pope belonged to one of the most noble families in Aragon. His high birth, his legal learning—he was for a long time professor of canon law at Montpellier—and the irreproachable purity of his life recommended him to Pope Gregory XI., who created him cardinal deacon of S. Maria in Cosmedin in 1374. He was elected pope, or rather anti-pope, by the cardinals of Avignon on Sept. 28, 1394. The hopes he had aroused that, by a voluntary abdication, he would restore unity to the church, were vain; though called upon by princes of France to carry out this plan, abandoned by his cardinals, besieged and finally kept under close observation in the palace of the popes (1398–1403), he stood firm. Escaping from Avignon, he again won obedience in France. He yielded, however, to the instances of the government of Charles VI., and began pourparlers for an interview with Gregory XII., with a view to their simultaneous abdication. The failure of these negotiations, for which he was only in part responsible, led to the universal movement of indignation and impatience, which ended, in France, in the declaration of neutrality (1408) and, at Pisa, in the decree of deposition against the two pontiffs (1409). Benedict XIII., who had on his part tried to call together a council at Perpignan, was by this time recognized hardly anywhere but in his native land, in Scotland, and in the estates of the countship of Armagnac. Abandoned by nearly all his adherents, he took refuge in the impregnable castle of Peñíscola, on a rock dominating the Mediterranean (1415). The Council of Constance then deposed him, as a perjurer, an incurable schismatic, and a heretic July 26, 1417. After struggling with the popes of Rome, Urban VI., Boniface IX., Innocent VII., and Gregory XII., and against the popes of Pisa, Alexander V. and John XXIII., Pedro de Luna, clinging more than ever to that apostolic seat which he still professed not to desire, again took up the struggle against Martin V., although the latter was recognized throughout almost all Christendom, and before his death (Nov. 29, 1422, or May 23, 1423) he nominated four new cardinals in order to carry on the schism.

See Fr. Ehrle, *Archiv für Lit und Kirchengesch.* vols. v., vi., vii.: N. Valois, *La France et le grand schisme d'occident* (1896–1902); Fr. Ehrle "Martin de Alpariils chronica acitatorum temporibus domini Benedicti XIII." (*Quellen und Forschungen aus dem Geb. der Gesch., Görres-Gesellschaft, Paderborn, 1906*).

Benedict XIII. (Piero Francesco Orsini), pope from 1724 to 1730, at first styled Benedict XIV., was born on Feb. 2, 1640,

of the ducal family of Orsini-Gravina. In 1667 he became a Dominican (as Vincentius Maria), studied theology and philosophy, was made a cardinal in 1672 and archbishop of Benevento in 1686. Elected pope on May 29, 1724, he attempted to reform clerical morals; but neither the decrees of the Latin council (1725) nor his personal precepts had much effect. He confirmed the bull *Unigenitus*; but, despite the Jesuits, allowed the Dominicans to preach the Augustinian doctrine of grace. State affairs he left entirely to the unpopular Cardinal Nicolo Coscia. He died on Feb. 21, 1730. His works were published in 3 vols. at Ravenna in 1728.

Benedict XIV. (Prospero Lorenzo Lambertini), pope from 1740 to 1758, was born at Bologna on March 31, 1675. At the age of 13 he entered the Collegium Clementinum at Rome. He served the Curia in many and important capacities, yet devoted his leisure time to theological and canonistic study. In 1725 Benedict XIII. made him an archbishop of Theodosia *in partibus*, then of Ancona (1727), and the next year created him cardinal priest. In 1731 Clement XII. translated him to his native city of Bologna, where, as archbishop, he was both efficient and popular. He published valuable works, notably *De sevorum Dei beatificatione et canonizatione*, *De sacrificio missae*, as well as a treatise on the feasts of Christ and the Virgin and of some saints honoured in Bologna. In a conclave which had lasted for months he was elected on Aug. 17, 1740, the successor of Clement XII. Benedict XIV. bettered the economic conditions of the papal states but was disinclined to undertake the needed thorough-going reform of its administration. He was the first pope expressly to recognize the king of Prussia as such. In 1741 he issued the bull *Immensa pastorum principis* demanding more humane treatment for the Indians of Brazil and Paraguay, and in the bulls *Ex quo singulari* (1742) and *Omnium sollicitudinum* (1744) he rebuked the missionary methods of the Jesuits in accommodating their message to the heathen usages of the Chinese and of the natives of Malabar. He reduced the number of holy days in several Catholic countries. To the end of his life he kept up his studies and his intercourse with other scholars, and founded several learned societies. His masterpiece, *Libri octo de synode diocesana*, begun in Bologna, appeared during his pontificate. He died on May 3, 1758.

His works, published in twelve quarto volumes at Rome (1747-1751), appeared in more nearly complete editions at Venice in 1767 and at Prato 1830-1846, also *Briefe Benedicts XIV.*, ed. F. X. Kraus (2nd ed., Freiburg, 1888); *Benedicti XIV. Papae opera inedita*, ed. F. Heiner (Freiburg, 1904). See Herzog-Hauck, *Realencyklopädie* ii. 572 ff.; Wetzler and Welter, *Kirchenlexikon* ii. 317 ff.

BENEDICT XV. (1854-1922), pope, was born at Pegli, in the diocese of Genoa, Nov. 21 1854, his name being Giacomo della Chiesa. He was educated in the seminary and at the University of Genoa, where he took his degree as doctor of law in 1875. He studied for the priesthood in the Collegio Capranica in Rome, from which he passed to the Accademia dei Nobili Ecclesiastici, the usual training school for those who devote themselves to the *carriera*, or diplomatic service, of the Vatican. Here he became the friend of Cardinal Rampolla, who, on being sent in 1885 as papal nuncio, to Madrid, took Chiesa with him as his private secretary. He remained in Spain four years, and in 1887, when Leo XIII. recalled Rampolla to make him his secretary of state, Chiesa also returned to Rome and was made *minutante* in his department.

In 1903, when Cardinal Merry del Val succeeded Rampolla as secretary of state, Chiesa was retained in his post. On Dec. 16 1907, Pius X. appointed him archbishop of Bologna, and on May 25, 1914, raised him to the dignity of cardinal. The outbreak of the World War in August of that year, and the death of Pius X. a few weeks later, found him in the midst of the pastoral duties of his great diocese. At this time, as cardinal-archbishop of Bologna, he delivered a remarkable address on the attitude and duty of the Church during the War, and strongly emphasized the paramount importance of the Holy See observing strict neutrality, while leaving nothing undone to restore peace and good will and to mitigate suffering. The address caused a deep impression, and was no doubt much in the minds of the cardinals

when they assembled in conclave for the election of a new pope on Aug. 31 1914. On Sept. 3, after 10 scrutinies, or votings, Cardinal della Chiesa was elected by a large majority, and was proclaimed from the balcony of St. Peter's as Benedict XV.

During the War he preserved an attitude of strict neutrality, and made several attempts to effect peace. Official relations between France and the Vatican were resumed, and a British representative was accredited to the Papal court for the first time since the 17th century. He died Jan. 22 1922.

BENEDICT, SIR JULIUS (1804-1885), musician, was born at Stuttgart, the son of a Jewish banker, Nov. 27, 1804, and died in London June 5, 1885. He studied under Hummel and Weber at Dresden, and by the latter's influence received an appointment in Vienna in 1823. He then spent some years in Italy, conducting and writing, and finally went, at the suggestion of Malibran, to London in 1835. He became a naturalized Englishman, and, settling in London, was a familiar figure in English musical life for 50 years. In 1838 he became conductor of the English opera at Drury Lane during the period of Balfe's great popularity. In 1852 he became musical conductor under Mapleson's management at Her Majesty's theatre (and afterwards at Drury Lane), and in the same year conductor of the Harmonic Union. His best-known opera—one of a large number—*The Lily of Killarney*, written on the subject of Dion Boucicault's play *Colleen Bawn* to a libretto by Oxenford, was produced at Covent Garden in 1862. Benedict conducted every Norwich festival from 1845 to 1878 inclusive, and the Liverpool Philharmonic Society's concerts from 1876 to 1880. He was knighted in 1871. He died in London June 5, 1885.

BENEDICT BISCOP (628?-690), also known as BISCOP BADUCING, English churchman of noble family, was for a time a thegn of Oswiu, King of Northumbria. He then went abroad and after a second journey to Rome (he made five altogether) lived as a monk at Lerins (665-667). It was under his conduct that Theodore of Tarsus came from Rome to Canterbury in 669, and in the same year Benedict was appointed abbot of St. Peter's, Canterbury. Five years later he built the monastery of St. Peter at Wearmouth, on land granted him by Egfrith of Northumbria, and endowed it with the large collection of books and art treasures which he had brought from Rome. A papal letter in 678 exempted the monastery from external control, and in 682 Benedict erected a sister foundation (St. Paul) at Jarrow. He died on Jan. 12, 690. Bede was one of his pupils.

BÉNÉDICTINE, D.O.M. A famous aromatic liqueur made at Fécamp on the coast of Normandy, 44m. from Dieppe. Some connoisseurs regard it as the only rival to the old Chartreuse. Both liqueurs have a romantic history. The religious orders were early famed for their liqueurs. The abbey of Fécamp, the origin of which goes back to A.D. 665, had, in 1510, a very learned monk, named Dom Bernardo Vincelli; he dabbled in chemistry and was devoted to the preparation of medicinal beverages; and one day he succeeded in producing an elixir which soon acquired great reputation as a refreshing and recuperative cordial. Its fame spread. Francis I visited the monastery in 1534, and praised the liqueur, which was named *Bénédictine*, *ad maiorem Dei gloriam*, "for the greater glory of God." In the Revolution of 1793 the abbey of Fécamp was swept away and the monks dispersed.

The recipe for the liqueur, jealously guarded, and other documents were entrusted to the procureur fiscal of the abbey. These, 70 years later, fell into the hands of M. Alexander Le Grand, a descendant of the original trustee. Being a wine merchant and having some knowledge of chemistry, he set about the task of reconstructing the liqueur. Eventually he succeeded and established a vast business. The present distillery buildings occupy the grounds which belonged to the old abbey. Every bottle of *Bénédictine* bears the ecclesiastical initials D O M. or *Deo Optimo Maximo*—"To God most good, most great."

BENEDICTINES or BLACK MONKS, monks living according to the Rule of St. Benedict (*q.v.*) of Nursia. Subiaco in the Abruzzi was the cradle of the Benedictines, and in that neighbourhood St. Benedict established 12 monasteries. Afterwards giving up the direction of these, he migrated to Monte Cas-

sino and there established the monastery which became the centre whence his rule and institute spread. From Monte Cassino he founded a monastery at Terracina. These 14 are the only monasteries of which we have any knowledge as being founded before St. Benedict's death.

About 580-590 Monte Cassino was sacked by the Lombards, and the community came to Rome and was established in a monastery attached to the Lateran Basilica, in the centre of the ecclesiastical world. It is now commonly recognized by scholars that when Gregory the Great became a monk and turned his palace on the Caelian hill into a monastery, the monastic life there carried out was fundamentally based on the Benedictine Rule (see F. H. Dudden, *Gregory the Great*, i. 108). From this monastery went forth St. Augustine and his companions on their mission to England in 596, carrying their monachism with them; thus England was the first country out of Italy in which Benedictine life was firmly planted. In the course of the 7th century Benedictine life was gradually introduced in Gaul. In the 8th it was carried into the Germanic lands from England; and during the 8th century it became, outside Ireland and other purely Celtic lands, the only rule and form of monastic life throughout western Europe—so completely that Charlemagne once asked if there ever had been any other monastic rule.

What may be called the inner side of Benedictine life and history is treated in the article **MONASTICISM**. Here it is possible to deal only with the broad facts of the external history. The chief external works achieved for western Europe by the Benedictines during the early middle ages may be summed up under the following heads.

1. **The Conversion of the Teutonic Races.**—The tendency of modern historical scholarship justifies the maintenance of the tradition that St. Augustine and his 40 companions were the first great Benedictine apostles and missionaries. Through their efforts Christianity was firmly planted in various parts of England; and after the conversion of the country it was English Benedictines who evangelized Holland and the greater part of central Germany, and founded and organized the German Church. Others carried Christianity as far as Scandinavia and Poland. The conversion of the Teutonic races may properly be called the work of the Benedictines.

2. **The Civilization of North-western Europe.**—As the result of their missionary enterprises the Benedictines penetrated into all these lands and established monasteries, so that by the 10th or 11th century Benedictine houses existed in great numbers throughout the whole of Latin Christendom except Ireland. These monasteries became centres of civilizing influences by the method of presenting object lessons in organized work, in agriculture, in farming, in the arts and trades and also in well-ordered life. The unconscious method by which such great results were brought about has been well described by J. S. Brewer (*Preface to Works of Giraldus Cambrensis*, Rolls Series, iv.) and F. A. Gasquet (*English Monastic Life*).

3. **Education.**—Boys were educated in Benedictine houses from the beginning, but at first they were destined to be monks. The monasteries, however, played a great part in the educational side of the Carolingian revival; and certainly from that date schools for boys destined to live and work in the world were frequently attached to Benedictine monasteries. From that day to this, education has been among the recognized and principal works of Benedictines.

4. **Letters and Learning.**—This side of Benedictine life is most typically represented by the Venerable Bede (q.v.), the gentle and learned scholar of the early middle ages. In those times the monasteries were the only places of security and rest in western Europe, the only places where letters could in any measure be cultivated. It was in the monasteries that the writings of Latin antiquity, both classical and ecclesiastical, were transcribed and preserved.

In a gigantic system embracing hundreds of monasteries and thousands of monks, and spread over all the countries of western Europe, without any organic bond between the different houses, and exposed to all the vicissitudes of the wars and conquests of

those wild times, to say that the monks often fell short of the ideal of their state, and sometimes short of the Christian, and even the moral standard, is but to say that monks are men. Failures there have been many, and scandals not a few in Benedictine history; but it may be said with truth that there does not appear to have been ever a period of widespread or universal corruption, however much at times and in places primitive love may have waxed cold. And when such declensions occurred, they soon called forth efforts at reform and revival; indeed these constantly recurring reform-movements are one of the most striking features of Benedictine history, and the great proof of the vitality of the institute throughout the ages.

The first of these movements arose during the Carolingian revival (c. 800), and is associated with the name of Benedict of Aniane. Under the auspices of Charlemagne and Louis the Pious he initiated a scheme for federating into one great order, with himself as abbot general, all the monasteries of Charles's empire, and for enforcing throughout a rigid uniformity in observance. For this purpose a synod of abbots was assembled at Aix-la-Chapelle in 817, and a series of 80 *Capitula* passed, regulating the life of the monasteries. The scheme as a whole was short-lived and did not survive its originator; but the *Capitula* were commonly recognized as supplying a useful and much-needed supplement to St. Benedict's Rule on points not sufficiently provided for therein. Accordingly these *Capitula* exercised a wide influence among Benedictines even outside the empire. And Benedict of Aniane's ideas of organization found embodiment a century later in the order of Cluny (910), which for a time overshadowed the great body of mere Benedictines (see **CLUNY**). Here it will suffice to say that the most distinctive features of the Cluny system were (1) a notable increase and prolongation of the church services, which came to take up the greater part of the working day; (2) a strongly centralized government, whereby the houses of the order in their hundreds were strictly subject to the abbot of Cluny.

Though forming a distinct, separate organism, Cluny claimed to be, and was recognized as, a body of Benedictine houses; but from that time onwards arose a number of independent bodies, or "orders," which took the Benedictine Rule as the basis of their life. By far the most important of these were the Cistercians, whose ground-idea was to reproduce exactly the life of St. Benedict's own monastery. What has here to be traced is the history of the great body of Benedictine monasteries that held aloof from these separatist movements.

For the first four or five centuries of Benedictine history there was no organic bond between any of the monasteries; each house formed an independent autonomous family, managing its own affairs and subject to no external authority or control except that of the bishop of the diocese. But the influence of Cluny, even on monasteries that did not enter into its organism, was enormous; many adopted Cluny customs and practices and moulded their life and spirit after the model it set; and many such monasteries became in turn centres of revival and reform in many lands, so that during the 10th and 11th centuries arose free unions of monasteries based on a common observance derived from a central abbey. But notwithstanding all these movements, the majority of the great Black Monk abbeys continued to the end of the 12th century in their primeval isolation. In the year 1215, at the fourth Lateran council regulations destined profoundly to modify Benedictine polity and history were made. It was decreed that the Benedictine houses of each ecclesiastical province should henceforth be federated for the purposes of mutual help and the maintenance of discipline, and that for these ends the abbots should every third year meet in a provincial chapter (or synod), in order to pass laws binding on all, and to appoint visitors who, in addition to the bishops, should canonically visit the monasteries and report on their condition in spirituals and temporals to the ensuing chapter. The English monks took the lead in carrying out this legislation; in 1218 the first chapter of the province of Canterbury was held at Oxford, and up to the dissolution under Henry VIII. the triennial chapters took place with wonderful regularity. The English Benedictines never advanced farther along the path

of centralization; up to their destruction this polity remained in operation among them, and proved itself by its results to be well adapted to the conditions of the Benedictine rule and life.

In other lands things did not on the whole go so well, and many causes at work during the later middle ages tended to bring about relaxation in the Benedictine houses. And so in the period of the reforming councils of Constance and Basel the state of the religious orders was seriously taken in hand, and in response to the public demand for reforming the Church "in head and members," reform movements were set on foot, as among others, so among the Benedictines of various parts of Europe. These movements issued in the congregational system which is the present polity among Benedictines. In the German lands, the system was kept on the lines of the Lateran decree, and received only some further developments in the direction of greater organization; but in Italy the congregation of S Justina at Padua (1421) afterwards called the Cassinese, departed altogether from the old lines, setting up a highly centralized government, after the model of the Italian republics, whereby the autonomy of the monasteries was destroyed, and they were subjected to the authority of a central governing board. With various modifications or restrictions this latter system was imported into all the Latin lands, into Spain and Portugal, and thence into Brazil, and into Lorraine and France, where the celebrated congregation of St. Maur (*see* MAURISTS) was formed early in the 17th century.

In England the Benedictines had, from every point of view, flourished exceedingly. At the time of the Dissolution there were nearly 300 Black Benedictine houses, great and small, men and women, including most of the chief religious houses of the land (for lists *see* tables and maps in Gasquet's *English Monastic Life*, and *Catholic Encyclopaedia*, art. "Benedictines"). It is now hardly necessary to say that the grave charges brought against the monks are no longer credited by serious historians (Gasquet, *Henry VIII, and the Monasteries*; J. Gairdner, Prefaces to the relevant volumes of *Calendars of State Papers of Henry VIII.*). In Mary's reign some of the surviving monks were brought together, and Westminster abbey was restored. Of the monks who professed there during this momentary revival, one, Sigebert Buckley, lived on into the reign of James I.; and being the only survivor of the Benedictines of England, he invested with the English habit, and affiliated to Westminster abbey and to the English congregation, two English priests, already Benedictines in the Italian congregation (1607). By this act the old English Benedictine line was perpetuated; and in 1619 a number of English monks, professed in Spain, were aggregated by pontifical act to these representatives of the old English Benedictines, and thus was constituted the present English Benedictine congregation. Three or four monasteries of the revived English Benedictines were established on the Continent at the beginning of the 17th century, and remained there till driven back to England by the French Revolution.

The 19th century witnessed a series of remarkable revivals, beginning in Bavaria. The French congregation was inaugurated in 1833, and the German congregation in 1863. Two vigorous congregations have arisen in the United States. These are all new creations since 1830. In Italy, Spain, Portugal and Brazil only a few monasteries survive the various revolutions, and in a crippled state; but signs are not wanting of renewed life; St. Benedict's own monasteries of Subiaco and Monte Cassino are relatively flourishing. In Austria, Hungary and Switzerland there are some great abbeys, most of which have had a continued existence since the middle ages. The English congregation includes five large abbeys (Downside, Ampleforth, Woolhampton, Fort Augustus and Hereford) and four nunneries; and there are communities both of monks and nuns belonging to foreign congregations.

In Rome an international Benedictine college for theological studies was established by Leo XIII., who conferred on its abbot the title of "Abbot Primate," with precedence among Black Monk abbots. He is only *primus inter pares*, and exercises no kind of superiority over the other abbots or congregations. Thus the Benedictine polity may be described as a number of auto-

nous federations of autonomous monasteries. The individual monks, too, belong not to the order or the congregation, but each to the monastery in which he became a monk. The chief external work of the Benedictines at the present day is secondary education; there are secondary schools or *gymnasias* attached to most of the abbeys, and many of the nunneries have girls' schools. In certain countries (among them England) where there is a dearth of secular priests, Benedictines undertake parochial work.

In conclusion a word must be said on the Benedictine nuns. From the beginning the number of women living the Benedictine life has not fallen far short of that of the men. St. Gregory describes St. Benedict's sister Scholastica as a nun (*sanctimonialis*), and she is looked upon as the foundress of Benedictine nuns. As the institute spread to other lands nunneries arose on all sides, and nowhere were the Benedictine nuns more numerous or more remarkable than in England, from Saxon times to the Reformation. A strong type of womanhood is revealed in the correspondence of St. Boniface with various Saxon Benedictine nuns, some in England and some who accompanied him to the Continent and there established great convents. In the early times the Benedictine nuns were not strictly enclosed, and could, when occasion called for it, freely go out of their convent walls to perform any special work. It has to be said that in the course of the middle ages, especially the later middle ages, grave disorders arose in many convents; and this doubtless led, in the reform movements initiated by the councils of Constance and Basel, and later of Trent, to the introduction of strict enclosure in Benedictine convents, which now is the almost universal practice.

See E. C. Butler, *Benedictine Monachism* (1924); F. Cabrol, art. "Monasticism (Christian)" in Hastings's *Encyclopaedia of Religion and Ethics*, vol. II., pp. 792-796, with many references to authorities; G. C. Alston, arts. "Benedict" and "Benedictine" in *Catholic Encyclopaedia*, vol. II.; Mabillon's *Annales* is the great authority up to 12th century; the full account, with good bibliography, in Max Hombucher's, *Orden und Kongregationen*, 1907, vol. I.; Newman's two essays on the Benedictines; Cardinal Gasquet, *Sketch of Monastic Constitutional History* (reprinted in *Monastic Life in the Middle Ages*, 1922).

BENEDICTION, strictly any blessing either of persons or things, but more commonly applied to formal blessings, such as are pronounced by the priest or minister at the close of religious services.

In the Roman Catholic Church the term is more often applied to a popular form of devotion to the Blessed Sacrament (*cf.* "Benediction of the Blessed Sacrament" in the *Catholic Encyclopaedia*). The details of this rite differ considerably in different places and in different circumstances, but the essential act is blessing the people with the host, which is taken from the tabernacle for the purpose and either left in the veiled ciborium or transferred to a monstrance and exposed for adoration before the blessing. The *Tantum ergo* and *O salutaris hostia* are commonly a part of this service and devotions to the Virgin, with the addition of the Rosary or other familiar prayers, are frequent accompaniments. The whole rite is, however, informal in character and spirit and the widest latitude is permitted in its use.

BENEDICT OF NURSIA, SAINT (c. 480-c. 544), the patriarch of Western monks. Our only authority for the facts of St. Benedict's life is bk. II of St. Gregory's *Dialogues*. St. Gregory declares that he obtained his information from four of St. Benedict's disciples whom he names; and there can be no serious reason for doubting that it is possible to reconstruct the outlines of St. Benedict's career (*see* Hodgkin *Italy and her Invaders*, iv. 412). A precise chronology and a pedigree have been supplied for Benedict, according to which he was born in 480, of the great family of the Anicii; but all we know is what St. Gregory tells us, that he was born of good family in Nursia, near Spoleto in Umbria. His birth must have occurred within a few years of the date assigned; the only fixed chronological point is a visit of the Gothic king Totila to him in 543, when Benedict was already established at Monte Cassino and advanced in years (*Dial.* II. 14, 15). He was sent by his parents to frequent the Roman schools, but shocked by the prevailing licentiousness he fled away. It has been usual to represent him as a mere boy at this time, but of late

years various considerations have been pointed out which make it more likely that he was a young man. He went to the mountainous districts of the Abruzzi, and at last came to the ruins of Nero's palace and the artificial lake at Subiaco, 40m. from Rome. Among the rocks on the side of the valley opposite the palace he found a cave in which he took up his abode, unknown to all except one friend, Romanus, a monk of a neighbouring monastery, who clothed him in the monastic habit and secretly supplied him with food. No one who has seen the spot will doubt that the Sacro Speco is indeed the cave wherein Benedict spent the three years of opening manhood in solitary prayer, contemplation and austerity. After this period of formation, his fame began to spread abroad, and the monks of a neighbouring monastery induced him to become their abbot; but their lives were irregular and dissolute, and on his trying to put down abuses they attempted to poison him. He returned to his cave, but disciples flocked to him, and in time he formed 12 monasteries in the neighbourhood, placing 12 monks in each, and himself retaining a general control over all. In time patricians and senators from Rome entrusted their young sons to his care, to be brought up as monks; in this manner came to him his two best-known disciples, Maurus and Placidus. Driven from Subiaco by the jealousy and molestations of a neighbouring priest, but leaving behind him communities in his 12 monasteries, he himself, accompanied by a small band of disciples, journeyed south until he came to Cassino, a town halfway between Rome and Naples. Climbing the high mountain that overhangs the town, he established on the summit the monastery with which his name has ever since been associated, and which for centuries was a chief centre of religious life for western Europe. He destroyed the remnants of paganism that lingered on here, and by his preaching gained the rustic population to Christianity. Few other facts of his career are known. There is record of his founding a monastery at Terracina; his death occurred after Totila's visit in 543.

Rule of St. Benedict.—In order to understand St. Benedict's character and spirit, and to discover the secret of the success of his institute, it is necessary, as St. Gregory says, to turn to his rule. St. Gregory's characterization of the rule as "conspicuous for its discretion" touches the most essential quality. The relation of St. Benedict's rule to earlier monastic rules, and of his institute to the prevailing monachism of his day, is explained in the article **MONASTICISM**. Here it is enough to say that nowadays it is commonly recognised by students that the manner of life instituted by St. Benedict was not intended to be, and as a matter of fact was not, one of any great austerity, when judged by the standard of his own day (see E. C. Butler *Lausiac History of Palladius*, pt. i., pp. 251-256). His monks were allowed proper clothes, sufficient food, ample sleep. The only bodily austerities were the abstinence from flesh meat and the unbroken fast till mid-day or even 3 P.M., but neither would appear so onerous in Italy even now, as to us in northern climes. Midnight office was no part of St. Benedict's rule: the time for rising for the night office varied from 1.30 to 3.0, according to the season, and the monks had had unbroken sleep for 7½ or even eight hours, except in the hot weather, when in compensation they were allowed the traditional Italian summer siesta after the mid-day meal. The canonical office was chanted throughout, but the directly religious duties of the day can hardly have taken more than four or five hours—perhaps eight on Sundays. The remaining hours of the day were divided between work and reading, in the proportion (on the average of the whole year) of about six and four hours respectively. The "reading" in St. Benedict's time was probably confined to the Bible and the Fathers. The "work" contemplated by St. Benedict was ordinarily field work, as was natural in view of the conditions of the time and best suited to the majority of the monks; but the principle laid down is that the monks should do whatever work is most useful. There were from the beginning young boys in the monastery, who were educated by the monks according to the ideas of the time. We have seen St. Benedict evangelizing the pagan population round Monte Cassino; and a considerable time each day is assigned to the reading of the Fathers. Thus the germs of all the chief works carried on by his monks in later ages were to be found in his own monastery.

The rule consists of a prologue and 73 chapters. Though it has resisted all attempts to reduce it to an ordered scheme, and probably was not written on any set plan, still it is possible roughly to indicate its contents: after the prologue and introductory chapter setting forth St. Benedict's intention, follow instructions to the abbot on the manner in which he should govern his monastery (2, 3); next comes the ascetical portion of the rule, on the chief monastic virtues (4-7); then the regulations for the celebration of the canonical office, which St. Benedict calls "the work of God" or "the divine work," his monks' first duty, "of which nothing is to take precedence" (8-20); faults and punishments (23-30); the cellarer and property of the monastery (31, 32); community of goods (33, 34); various officials and daily life (21, 22, 35-57); reception of monks (58-61); miscellaneous (62-73).

The most remarkable chapters, in which St. Benedict's wisdom stands out most conspicuously, are those on the abbot (2, 3, 27, 64). The abbot is to govern the monastery with full and unquestioned patriarchal authority; on important matters he must consult the whole community and hear what each one, even the youngest, thinks; on matters of less weight he should consult a few of the elder monks; but in either case the decision rests entirely with him, and all are to acquiesce. He must, however, bear in mind that he will have to render an account of all his decisions and to answer for the souls of all his monks before the judgment seat of God. Moreover, he has to govern in accordance with the rule, and must endeavour, while enforcing discipline and implanting virtues not to sadden or "overdrive" his monks or give them cause for "just murmuring." In these chapters pre-eminently appears that element of "discretion," as St. Gregory calls it, or humanism as it would now be termed, which without doubt has been a chief cause of the success of the rule. The only critical manual edition of the rule is that of E. C. Butler, *S. Benedicti, editio critico-practica* (Freiburg, 1927). Of the many commentaries the most valuable are those of Paulus Diaconus (the earliest, c. 800), of Calmet and of Martène (*Migne Patrol. Lat.* lxvi.), and of Abbot Delatte, 1913 (translated).

BIBLIOGRAPHY.—On St. Benedict and his Rule and institute, see E. C. Butler, *Benedictine Monachism* (1924). An old English trans. of St. Gregory's *Dialogues* is reprinted in the Quarterly Series (Burns and Oates). On St. Benedict's life and Rule see Montalembert, *Monks of the West*, bk. iv.; Abbate L. Tosti, *S. Benedetto* (trans. 1896); Abbot Herwegen, *Der heilige Benedikt* (1926), the best modern monograph (translated) also indexes to standard general histories of the period; Thomas Hodgkin's *Italy and Her Invaders* and Gregorovius' *History of the City of Rome* may be specially mentioned. But by far the best summaries in English are those contained in the relevant portions of F. H. Dudden's *Gregory the Great* (1905), i. 107-115, ii. 160-169. (E. C. B.)

BENEDICTUS, the hymn of Zacharias (Luke i. 68 sqq.), so called from the opening word of the Latin version. The hymn has been used in Christian worship since at least the 9th century, and was adopted into the Anglican Order of Morning Prayer from the Roman service of matin-lauds. In the Prayer Book of 1549 there was no alternative to the *Benedictus*; it was to be used "throughout the whole year." In 1552 the *Jubilate* was inserted without any restriction as to how often it should take the place of the *Benedictus*. The name is also given to a part of the Roman Catholic mass service beginning *Benedictus qui venit*.

BENEDICTUS ABBAS (d. 1194), abbot of Peterborough, whose name is accidentally connected with the *Gesta Henrici Regis Secundi*, one of the most valuable of English 12th century chronicles. He first makes his appearance in 1174, as the chancellor of Archbishop Richard, the successor of Becket in the primacy. In 1175 Benedictus became prior of Holy Trinity, Canterbury; in 1177 he received from Henry II. the abbacy of Peterborough which he held until his death. Benedictus wrote two works dealing with the martyrdom and the miracles of Becket. Fragments of the former work have come down to us in the compilation known as the *Quadrilogus*, which is printed in the fourth volume of J. C. Robertson's *Materials for the History of Thomas Becket* (Rolls series); the miracles are extant in their entirety, and are printed in the second volume of the same collection. Benedictus has been credited with the authorship of the *Gesta Henrici* on the ground that his name appears in the title

of the oldest manuscript. We have, however, conclusive evidence that Benedictus merely caused this work to be transcribed for the Peterborough library. It is only through the force of custom that the work is still occasionally cited under the name of Benedictus. The question of authorship has been discussed by Sir T. D. Hardy, Bishop Stubbs and Prof. Liebermann; but the results of the discussion are negative. Stubbs conjecturally identified the first part of the *Gesta* (1170-77) with the *Liber Tricolumnis*, a register of contemporary events kept by Richard Fitz Neal (q.v.), the treasurer of Henry II. and author of the *Dialogus de Scaccario*; the latter part (1177-92) was by the same authority ascribed to Roger of Hoveden, who makes large use of the *Gesta* in his own chronicle, copying them with few alterations beyond the addition of some documents. This theory, so far as concerns the *Liber Tricolumnis*, is rejected by Liebermann, and the most recent editors of the *Dialogus* (A. Hughes, C. G. Crump and C. Johnson, Oxford 1902). The work begins at Christmas 1169, and concludes in 1192; it is thus in form a fragment, covering portions of the reign of Henry II. and Richard I.

See W. Stubbs' *Gesta regis Henrici Secundi Benedicti abbatis* (Rolls series, 1867), and particularly the preface to the first volume; F. Liebermann in *Einleitung in den Dialogus de Scaccario* (Göttingen, 1875); in *Ostenglische Geschichtsquellen* (Hanover, 1892); and in Pertz's *Monumenta Germaniae Historica, Scriptores*, vol. xxvii pp. 82, 83; and also the introduction to the *Dialogus de Scaccario* in the Oxford edition of 1902. (H. W. C. D.)

BENEDIX, JULIUS RODERICH (1811-1873), German dramatist and librettist, was born at Leipzig on Jan. 21, 1811, and was educated at the Thomasschule at Leipzig. He was manager of theatres at Wesel, Elberfeld, and Frankfurt-on-Main, and died in Leipzig on Sept. 26, 1873. Benedix's comedies, the scenes of which are mostly laid in upper middle-class life, enjoyed a certain popularity for many years after his death; the best known are. *Dr. Wespe*; *Die Hochzeitsreise*; *Der Vetter*; *Das Gefängnis*; *Das Lügen*; *Ein Lustspiel*; *Der Störchenfried*; *Die Dienstboten*; *Aschenbrödel*; *Die zärtlichen Verwandten*. The chief characteristics of his farces are a clear plot and bright, easy and natural dialogue. Among his more serious works are. *Bilder aus dem Schauspielernleben* (Leipzig, 1847); *Der mündliche Vortrag* (Leipzig, 1859-60); *Das Wesen des deutschen Rhythmus* (Leipzig, 1862); and, posthumously *Die Shakespearomanie* (1873), in which he attacks the extreme adoration of the British poet.

See Benedix's *Gesammelte dramatische Werke* (Leipzig, 1846-75); a selection under the title *Volks-theater* (Leipzig, 1882); and a collection of smaller comedies as *Haustheater* (10th ed., Leipzig, 1891); see Benedix's autobiography in the *Gartenlaube* (1871).

BENEFICE, a term first applied under the Roman empire to portions of land, the usufruct of which was granted by the emperors to their soldiers or others for life, as a reward or *beneficium* for past services, and as a retainer for future services.

The term benefice, according to the canon law, implies always an ecclesiastical office, *propter quod beneficium datur*, but it does not always imply a cure of souls. It has been defined to be the right which a clerk has to enjoy certain ecclesiastical revenues on condition of discharging certain services prescribed by the canons, or by usage, or by the conditions under which his office has been founded. These services might be those of a secular priest with cure of souls, or they might be those of a regular priest, a member of a religious order, without cure of souls; but in every case a benefice implied three things: (1) An obligation to discharge the duties of an office, which is altogether spiritual (2) The right to enjoy the fruits attached to that office, which is the benefice itself. (3) The fruits themselves, which are the temporalities. By keeping these distinctions in view, the right of patronage in the case of secular benefices becomes intelligible, being in fact the right, which was originally vested in the donor of the temporalities, to present to the bishop a clerk to be admitted, if found fit by the bishop, to the office to which those temporalities are annexed. Secular or parochial benefices are of three kinds—rectories, vicarages, or perpetual curacies (see ADVOWSON). Presentation on the part of the patron of the benefice is the first requisite in order that a clerk should become legally entitled to a benefice. The next requisite is that he should be admitted by the bishop

as a fit person for the spiritual office to which the benefice is annexed. By the early constitutions of the Church of England, a bishop was allowed a space of two months to enquire and inform himself of the sufficiency of every presentee, but by the 95th of the canons of 1604, that interval has been abridged to 28 days, within which the bishop must admit or reject the clerk. If the bishop rejects the clerk within that time he is liable to a *duplex querela* in the courts of the metropolitan, or to a *quare impedit* in the high court of justice, or there may be an appeal under the Benefices Act 1898. Upon the bishop having satisfied himself of the sufficiency of the clerk, he proceeds to institute him to the spiritual office to which the benefice is annexed, but before such institution can take place, the clerk is required to make a declaration of assent to the Thirty-nine Articles of Religion and to the Book of Common Prayer according to a form prescribed in the Clerical Subscription Act, 1865, to make a declaration against simony in accordance with that act, and to take and subscribe the oath of allegiance according to the form in the Promissory Oaths Act 1868. The bishop, by the act of institution, commits to the clerk the cure of souls attached to the office to which the benefice is annexed. In cases where the bishop himself is patron of the benefice, the bishop collates the clerk to the benefice and office. It is not necessary that the bishop should personally institute or collate a clerk; he may issue a fiat to his vicar-general, or to a special commissary for that purpose. After the bishop or his commissary has instituted or collated the presentee, he issues a mandate under seal, addressed to the archdeacon or some other neighbouring clergyman, authorizing him to induct the clerk into his benefice—in other words, to put him into legal possession of the temporalities, which is done by some outward form, and for the most part by delivery of the bell-rope to the clerk, who thereupon tolls the bell. This form of induction is required to give the clerk a legal title to his *beneficium*, although his admission to the office by institution is sufficient to vacate any other benefice which he may already possess. What has been said above applies to rectories and vicarages. A perpetual curate is put in possession of his benefice by the licence of the bishop without institution, collation or induction; the patron is said to "nominate." The final duty of a new incumbent is on the first Sunday on which he officiates to "read himself in," i.e., read the Thirty-nine Articles in the presence of the congregation and declare his assent thereto.

By a decree of the Lateran council of 1215, which was enforced in England, no clerk can hold two benefices with cure of souls, and if a beneficed clerk shall take a second benefice with cure of souls, he vacates *ipso facto* his first benefice. Dispensations, however, could be easily obtained from Rome, before the reformation of the Church of England, to enable a clerk to hold several ecclesiastical dignities or benefices at the same time, and by the Peterperence, Dispensations, etc., Act 1534, the power to grant such dispensations, which had been exercised by the Court of Rome, was transferred to the archbishop of Canterbury, certain ecclesiastical persons having been declared by a previous statute (1520) to be entitled to such dispensations. The system of pluralities carried with it, as a necessary consequence, systematic non-residence on the part of many incumbents, and delegation of their spiritual duties in respect of their cure of souls to assistant curates. The evils attendant on this system were found to be so great that the Pluralities Act 1838 was passed to abridge the holding of benefices in plurality, and it was enacted that no person should hold, under any circumstances more than two benefices, and this privilege was made subject to the restriction that his benefices were within ten statute miles of each other. By the Pluralities Act 1850 the restriction was further narrowed, so that no spiritual person could hold two benefices except the churches of such benefices were within three miles of each other by the nearest road, and the annual value of one of such benefices did not exceed £100. The Pluralities Acts Amendment Act 1885, however, enacted that two benefices could be held together, the churches of which are within four miles of each other, and the annual value of one of which does not exceed £200.

Benefices used to pay their first fruits (one year's profits) and tenths (of yearly profits) to Queen Anne's Bounty, but by a series

of enactments of which the last is the First Fruits and Tenths Measure 1926, this liability has been taken away. Their profits during vacation belong to the next incumbent. Tithe rent charge attached to a benefice is relieved from payment of one-half of the agricultural rates assessed thereon. An incumbent has to reside on his benefice nine months in the year, unless he gets leave for a longer absence from the bishop, and he has to maintain the house and other buildings in repair (see *DILAPIDATIONS*). Benefices may be exchanged by agreement between incumbents with the consent of the ordinary and of the patrons, and they may, with the consent of the patron and ordinary, be united or dissolved after being united. They may also be charged with the repayment of money laid out for their permanent advantage, and be augmented by the medium of Queen Anne's Bounty.

A benefice is avoided or vacated—(1) By death. (2) By resignation, if the bishop is willing to accept resignation. By the Incumbents' Resignation Acts, any clergyman who has been an incumbent of one benefice continuously for seven years, and is incapacitated by permanent mental or bodily infirmities from fulfilling his duties, may have assigned to him out of the benefice, a retiring pension, not exceeding one-third of its annual value. These provisions, however, are much modified by the Clergy Pensions Measure, 1926, and will, when that measure comes into full operation, disappear. (3) By cession, upon the clerk being instituted to another benefice or some other preferment incompatible with it. (4) By deprivation by an ecclesiastical court or by declaration of avoidance (a) under the Clergy Discipline Act, 1892, (b) under the Public Worship Regulation Act 1874 (but this latter procedure is out of use), (c) under the Benefices Act 1898 if the living is under sequestration for a year, (d) under the Benefices (Ecclesiastical Duties) Measure 1926, if the inhibition of an incumbent for neglect of duties prescribed by the measure continues undetermined for five years. (5) By act of law in consequence of simony. (6) By default of the clerk to read himself in. Two or more benefices may be united. There have been several statutes on this subject but except for the City of London all the present law is contained in the Union of Benefices Measure 1923. For the city of London the provisions are contained in the Act 23 and 24 Vict. c. 142.

See also *ADVOWSON*; *CURATE*; *GLEBE*; *INCUMBENT*; *RECTOR*; *VICAR*. Also Phillimore, *Eccles. Law*; Cripps, *Law of Church and Clergy*.

BENEFICIARY, in law, one who holds a benefice; one who is beneficially entitled to, or interested in, property, i.e., entitled to it for his own benefit, and not merely holding it for others, as does an executor or trustee. In this latter sense it is nearly equivalent to *cestui que trust*, a term which it is gradually superseding in modern law.

BENEFIT SOCIETIES, a term sometimes employed to describe associations formed for the purpose of obtaining for their members, or for the dependents of their members, certain deferred benefits, such as payments during sickness or funeral allowances. Benefit societies are in fact insurance societies, and their activities range over a wide field. The name benefit society is more frequently employed in the United States; in Great Britain such an institution is termed a friendly society. Under the National Insurance act, most of the British friendly societies have acquired a legal status as "Approved Societies" (q.v.). (See *FRIENDLY SOCIETIES*, and *NATIONAL INSURANCE: Health*.)

BENE-ISRAEL ("Sons of Israel"), a colony of Jews settled in Kolaba, Bombay and Shana districts and the native state of Janjira. With the Jews of Cochin, they represent a very ancient Judaic invasion of India. Some think the Bene-Israel settled in Kolaba in the 6th century, but traditions indicate a far longer connection with India (see *Jews*: § 3).

See R. E. Enthoven, *Tribes and Castes of Bombay* (1920).

BENEKE, FRIEDRICH EDUARD (1798–1854), German psychologist, was born at Berlin on Feb. 17, 1798, and educated at the universities of Halle and Berlin. After studying theology under Schleiermacher and de Wette, he turned to philosophy, especially to English writers and the German modifiers of Kantianism, such as Jacobi, Fries and Schopenhauer. In 1820 he published his *Erkenntnisstheorie*, his *Erfahrungsseelenlehre als*

Grundlage alles Wissens, and his *De Veris Philosophiae Initii*. His marked opposition to Hegelianism then dominant in Berlin, was shown more clearly in the short tract, *Neue Grundlegung zur Metaphysik* (1822), and in the able treatise, *Grundlegung zur Physik der Sitten* (1822), written against Kant's *Metaphysic of Ethics* deducing ethical principles from a basis of empirical feeling. In 1822 his lectures were prohibited at Berlin, possibly through Hegel's influence with the authorities, who also prevented him from obtaining a chair from the Saxon Government. After lecturing at Göttingen he was allowed to return to Berlin, and in 1832 became *professor extraordinarius* in the university, a post which he continued to hold till his death. In his *Neue Psychologie* (1845) and his *Lehrbuch der Psychologie als Naturwissenschaft* (1833), Beneke signalized as the two great stages in the progress of psychology the negation of innate ideas by Locke, and of faculties, in the ordinary acceptation of the term, by Herbart. His own contribution to the subject consists in his insistence that empirical psychology is the basis of all philosophy, that psychology depends on introspection and must be free from metaphysics and mathematics, and that mental phenomena must be treated by the genetic method. Starting from the rejections of innate ideas and the theory of faculties, Beneke supposes that originally the soul is an immense variety of powers or forces which differ only in tenacity, vivacity, receptivity and grouping and which gradually acquire definiteness through the action of *stimuli* from the outer world. If the impression be sufficiently strong, consciousness arises, and definite sensations and perceptions begin to be formed. There are no special faculties of judgment or reasoning. Judgment is the springing into consciousness of a concept alongside of an intuition, or of a higher concept alongside of a lower. Reasoning is merely a more complex judgment. The understanding is simply the mass of concepts lying in the background of unconsciousness, ready to be called up and to flow with force towards anything closely connected with them. Even memory is not a special faculty; it is simply the fundamental property of tenacity possessed by the original faculties. The very distinction between the great classes—Knowledge, Feeling and Will—may be referred to elementary differences in the original relations of faculty and impression (see *ASSOCIATION OF IDEAS*).

The special value of Beneke's works consists in their many acute psychological analyses which can be utilized in the training of unformed minds, but their original hypotheses are often hastily assumed and rest on a clumsy mechanical metaphor. As in all empirical theories of mental development, the higher categories which are apparently shown to result from the simple elements, are really presupposed at every step. Particularly unsatisfactory is the account of consciousness, which is said to arise from the union of impression and faculty. The necessity of consciousness for any mental action whatsoever is apparently granted, but the conditions involved in it are never discussed or mentioned. The same defect appears in the account of ethical judgment; no amount of empirical fact can ever yield the notion of absolute duty.

A complete list of Beneke's writings appears in the appendix to Dressler's edition of the *Lehrbuch der Psychologie als Naturwissenschaft* (1861). The chief are:—*Psychologische Skizzen* (1825); *Pragmatische Psychologie oder Seelenlehre in der Anwendung auf das Leben* (1832); *Metaphysik und Religionsphilosophie* (1840); *Die neue Psychologie* (1845); see also J. G. Dressler, *Beneke oder Seelenlehre als Naturwissenschaft*; O. E. Hummel, *Die Unterrichtstheorie Benekes* (1885); C. H. Th. Kuhn, *Die Sittenlehre F. E. Benekes* (1892); Brandt, *Beneke, the Man and His Philosophy* (New York, 1895); Joh. Friedrich, *F. E. Beneke* (Wiesbaden, 1898, with biography and list of works); Otto Gramzow, *F. E. Benekes Leben und Philos.* (Berne, 1899, with full bibliography); H. Hoffding, *Hist. of Mod. Phil.*, vol. ii. (Eng. trans., 1900); H. Renner, *Benekes Erkenntnistheorie* (Halle, 1902); A. Wandschneider, *Die Metaphysik Benekes* (1903); G. S. Brett, *Hist. of Psychology*, vol. iii. (1921); F. Ueberweg, *Grundriss der Geschichte der Philosophie*, pt. iv. (1923).

BENEŠ, EDWARD (1884–), Czechoslovak statesman, was born May 28, 1884, in the village of Kožlany, Czechoslovakia. His parents were poor peasants, but the boy was educated in the faculty of philosophy at Prague university, where fees are small and are wholly remitted in the case of poor students. He continued his education at the Sorbonne and the École de Science

Politique in Paris, then at Dijon, where he graduated as doctor of laws (1908). In 1909 he was appointed professor of economics at the Prague Academy of Commerce, in 1912 lecturer, and in 1922 professor in sociology at the University of Prague. When the World War broke out he was still a young man of 30, but was already one of the leaders of the Czechoslovak nationalist movement, and soon became Dr. Masaryk's right-hand man in the work of intensive nationalist propaganda which was precipitated by the World War. In 1915 he went to Paris to work as a journalist and diplomat in the cause of Czechoslovak liberation from the Habsburg yoke. There he collaborated with Dr. T. G. Masaryk and Gen. Stefanik in support of the Allied cause. In that same year he was made general secretary in the Czechoslovak National Council, the executive body of the national movement, which in 1918 was recognized by the Allies as the Czechoslovak Provisional Government.

Place in European Politics.—Dr. Beneš became Foreign Minister in the newly formed government, and himself formed one government (1921–22). He was the head of the Czechoslovak Delegation to the Paris Peace Conference (1919–20), and a signatory of the Peace Treaties. He was appointed Czechoslovak representative at the League of Nations in 1920; was elected a member of the League Council in 1923, and re-elected in 1925. He was co-founder of the Little Entente in Aug. 1920, part-author and keen advocate of the Geneva Protocol of 1924, and represented Czechoslovakia at the many diplomatic conferences to which she was a party after the War. On behalf of his country he initialled the Locarno Treaties on Oct. 16 1925, and signed them in London on Dec. 1 1925.

The outstanding personality of Beneš in the post-War years was, not unnaturally, the cause of controversy among students of affairs in western Europe, especially in Great Britain. British opinion of the Left criticized him on the occasion of several Franco-British diplomatic crises between 1920 and 1924, especially those created by the Genoa Conference and the Geneva Protocol, on the ground that his orientation was toward Paris rather than toward London. Others criticized him on the alleged ground of "interference" between Paris and London; and yet again, that his policy was that of an opportunist. The view, however, that is supported by the evidence of Dr. Beneš' public statements and by his record of action, appears to be that he regarded Czechoslovak political independence, in the first instance, as due largely to the Franco-British Entente and was therefore anxious to preserve the continuance of that entente. Franco-British diplomatic quarrels caused him anxiety, both for the particular interests of Czechoslovak security and for the general interests of European stability. At the same time, he showed himself to be an unsentimental realist, holding the view that a negative attitude in diplomacy was a blunder, irrespective of the merits of the case.

His object was the political and economic consolidation of Czechoslovakia, to be effected through the regional method of the Little Entente and through a general European stabilization. He adopted a most progressive policy toward Russia, Czechoslovakia being the first country in Europe to restart trade with that country. In common with the statesmen of most of the small nations in Europe, Dr. Beneš wished to see the principle of universal compulsory arbitration enshrined in international law. He partly evolved and subsequently advocated the Geneva Protocol of 1924. To Dr. Beneš the main attraction of the protocol was that it would, in his view, safeguard the interests of the small states, and best serve the interests of Europe.

It was not till the eve of the Locarno Conference in 1925, that he abandoned his public appeals on behalf of the principles of the protocol (even though the protocol itself was a dead letter by then); and he made it clear, when the Locarno treaties were initialled, that he regarded them as an instalment of the protocol idea. Dr. Beneš never concealed that in his view and in that of his Yugoslav and Rumanian colleagues it was an important function of the Little Entente to prevent any Hungarian or Habsburg coup against the 1919 settlement. It was largely due to his influence that the two attempts of April and Oct. 1921, to restore the Habsburg régime at Budapest, failed. Dr. Beneš has shown

himself to be progressive in policy, and exceptionally well informed. His unbroken period of office, his work for the League of Nations and the close touch he has maintained with European affairs during seven years make him one of the most influential of post-War statesmen in Europe. After the Locarno treaties were negotiated he at once began laying the diplomatic foundations for a "Locarno" treaty for the east of Europe, to which Hungary should be a party on the analogy of Germany's participation in the western pact. He is the author of some 12 volumes on political and sociological subjects. His published works are mainly concerned with political economy and social conditions in Central Europe (see *LITTLE ENTEENTE*).

BIBLIOGRAPHY.—Periodic pamphlets, reproducing his public statements, issued by Orbis (Prague, 1920–25); E. Beneš, *Five Years of Czechoslovak Foreign Policy* (1924). (G. G.)

BENETT, ETHELDRED (1776–1845), one of the earliest of English women geologists, the second daughter of Thomas Benett, of Pyt House near Tisbury, was born in 1776. She collected and studied the fossils of her native county, and contributed "A Catalogue of the Organic Remains of the County of Wilts" to Sir R. C. Hoare's *County History*. She died on Jan. 11, 1845.

BENEVENTO, archiepiscopal see, Campania, Italy, capital of province of Benevento. 60m. by rail and 32m direct N.E. of Naples, on a hill 400ft. above sea-level at the confluence of the Calore and Sabdato. Pop. (1921), 20,429 (town); 27,510 (commune). *Beneventum*, originally *Maleventum* or *Maluentum*, supposed in the imperial period to have been founded by Diomedes, was the chief town of the Samnites, who took refuge here after their defeat by Rome (314 B.C.). It appears not to have fallen until Pyrrhus' absence in Sicily, but served Rome as a base of operations in the last campaign against him in 275 B.C. A Latin colony was planted there in 268 B.C., and the name was changed for the sake of the omen. It was a fortress important to the Romans in the Punic and Social Wars. It was the junction of the prolongation of the *Via Appia* from Capua, its continuation to Tarentum and Brundisium, the *Via Traiana* to Brundisium by Herdoniae, the road to Telesia and Aesernia, the road to Aesernia by Bovianum and the road to Abellinum and Salernum. The Triumphal Arch erected in honour of Trajan by the senate and people of Rome in A.D. 114 has important reliefs. Besides the ancient theatre, a large *cryptoporticus* 197ft. long and a brick arch (called the Arco del Sacramento) remain, while below the town is the Ponte Lebbroso, a bridge of the *Via Appia* over the Sabbato, and along the road to Avellino are remains of *thermae*. In front of the Madonna delle Grazie is a bull in red Egyptian granite and in the Piazza Papiniano the fragments of two Egyptian obelisks erected in A.D. 88 in front of the temple of Isis in honour of Domitian, the foundations of which were discovered close to the Arch of Trajan, with many fragments of fine sculptures. The city was razed by Totila (A.D. 542) and partly rebuilt (663), later mediaeval fortifications following the old lines. Benevento became the seat of a powerful Lombard duchy independent until 1053, when the emperor, Henry III., ceded it to Leo IX. in exchange for the bishopric of Bamberg; it continued in papal possession until 1806, when Napoleon granted it to Talleyrand with the title of prince. In 1815 it returned to the papacy, but was united to Italy in 1860. Much damage has been done by earthquakes. The circular church of S. Sofia (760), now modernized, has a roof supported by six ancient columns; the cathedral (9th–12th century) has a fine arcaded façade, incomplete square campanile (begun 1279) and bronze doors (early 13th century) adorned with bas-reliefs. The interior is in the form of a basilica, with double aisles borne by ancient columns. The 14th-century castle is at the highest point of the town.

Benevento is a station on the railway from Naples to Foggia, and has branch lines to Campobasso, Avellino and Cancellio

See A. Meomartini, *Monumenti e opere d'Arte di Benevento* (Benevento, 1899); *Benevento* (Arti Grafiche, Bergamo, 1909) well illustrated.

Battle of Benevento, Feb. 26, 1266.—This ranks as one of the rare examples of intelligent mediaeval cavalry tactics. It

arose out of the long struggle between the Papacy and the house of Hohenstaufen, which held the kingdoms of Naples and Sicily. By an offer of the Crown of the Two Sicilies then held by Manfred, Pope Clement IV. in 1265 gained the aid of Charles of Anjou, brother of St. Louis. It may have been an attraction to Charles that the pope proclaimed his expedition as a crusade, but at least he came, with several thousand cavalry and a larger number of feudal foot. Charles himself arrived at Rome by sea in May 1265, but his main force only arrived by an overland march in Jan. 1266. By then he had so far exhausted the pope's subsidies that he had to move them off eight days later in order to gain a footing where they could live free off the enemy country. He found his path barred at Capua, where Manfred had taken up a position behind the Volturno. So strong was he that Charles judged an indirect approach to Naples was the wiser course, and preferred the risks of a winter march through the Apennines to that of a frontal assault. But his army suffered terribly, lost many of its horses, and had to abandon all its wheeled transport. And when the half-starved army descended into the plain at Benevento Charles found Manfred awaiting him. For the Volturno he had merely exchanged the Calore, crossable by only the one bridge. But if Charles's camp was threatened with starvation, Manfred's was threatened by disloyalty. He chose, whether from fear of delay or from knight-errantry, to attack on Feb. 26, when a few more days' waiting would have ensured Charles's exhaustion. Manfred's Saracen foot-archers led the way across the bridge, followed by the cavalry in three divisions or "battles." The first consisted of 1,200 Germans in the new plate armour instead of the usual chain-mail, the second of 1,000 Italian mercenaries, and the third of about 1,400 of his own knights, of dubious loyalty, together with his faithful Saracen light horse.

Charles wasted no time in preparing to meet him. He formed his cavalry likewise in three rather smaller divisions, with a couple of foot-soldiers behind each man-at-arms to aid him in the mêlée. The remainder of the foot skirmished in front ineffectively on both sides, and they were swept out of the way by the advance of Manfred's German cavalry. These steadily pressed back their mounted opponents until Charles threw in his second division. Even then the Germans held their own until it was noticed that as they raised their arms to strike an unprotected patch was exposed. The cry was passed down the French ranks to thrust at the armpits, and by this device the Germans were broken up. Manfred's second division came up over the narrow bridge too late to succour them, and, itself charged in front and in rear by French horsemen who swept round the flanks, soon dispersed. Late again, Manfred's third division arrived to find Charles's cavalry reformed. Before the charge was made, many of Manfred's disloyal nobles swerved away and left the field, and he himself found in the midst of the enemy the death he then deliberately sought. While we recognize the effect of the final and fatal disloyalty, the victory, however, was deservedly won by Charles's able control and well-timed use of his successive divisions.

BENEVOLENCE, a term for an act of kindness, or a gift of money or goods, but used in a special sense to indicate sums of money, disguised as gifts, which were extorted by various English kings from their subjects without consent of parliament (Lat. *bene*, well, and *volens*, wishing). Edward II. and Richard II. had obtained funds by resorting to forced loans, a practice which was probably not unusual in earlier times. Edward IV., however, discarded even the pretence of repayment, and in 1473 the word *benevolence* was first used with reference to a royal demand for a gift. Edward was very successful in these efforts, and as they only concerned a limited number of persons he did not incur serious unpopularity. But when Richard III. sought to emulate his brother's example protests were made which led to the passing of an act of parliament in 1484 abolishing benevolences as "new and unlawful inventions." In spite of this act Richard demanded a further benevolence; but it was Henry VII. who made the most extensive use of the system. In 1545 Henry VIII. demanded a "loving contribution" from all who possessed lands worth not less than forty shillings a year, or chattels to the value of £15.

In 1614 James I. ordered the sheriffs and magistrates in each county and borough to collect a general benevolence from all persons of ability, and with some difficulty about £40,000 was collected. Four counties had, however, distinguished themselves by protests against this demand, and the act of Richard III. had been cited by various objectors. Representatives from the four counties were accordingly called before the privy council, where Sir Edward Coke defended the action of the king, quoted the Tudor precedents and urged that the act of 1484 was to prevent exactions, not voluntary gifts such as James had requested. In 1615 an attempt to exact a benevolence in Ireland failed, and in 1620 it was decided to demand one for the defence of the Palatinate. Circular letters were sent out, punishments were inflicted, but many excuses were made and only about £34,000 was contributed. In 1621 a further attempt was made, judges of assize and others were ordered to press for contributions and wealthy men were called before the privy council and asked to name a sum at which to be rated. About £88,000 was thus raised, and in 1622, William Fiennes, 1st Viscount Saye and Sele, was imprisoned for six months for protesting. This was the last time benevolences were collected, although they were proposed in 1622, 1625, and 1633.

BENFEY, THEODOR (1809–1881), German philologist, and Sanskrit scholar, born on Jan. 29, 1809. He published in 1848 his edition of the *Sāmaveda*; in 1852–54 his *Manual of Sanskrit*, comprising a grammar and chrestomathy; in 1858 his practical Sanskrit grammar, afterwards translated into English; and in 1859 his edition of the *Pancha Tantra*, with an extensive dissertation on the fables and mythologies of primitive nations. In 1862 he was appointed professor at Göttingen and in 1866 he published his great Sanskrit-English dictionary. In 1869 he wrote a history of German philological research, especially oriental, during the 19th century. He died while engaged on a grammar of Vedic Sanskrit.

A collection of his various writings was published in 1890, prefaced by a memoir by his son.

BENGAL, a province of British India, bounded on the east by Assam and Burma; on the south by the Bay of Bengal and Madras; on the west by the province of Behar and Orissa; and on the north by Nepal and Bhutan. It has an area (including the states of Cooch Behar and Tirupra) of 82,277 sq. m. and a population (1921) of 47,592,462.

The name Bengal is derived from the ancient Banga or Vanga, a kingdom conterminous with the delta of Bengal to the south of the Ganges and to the east of the river Bhagirathi. It occurs in the form Vangalam in an inscription of the 11th century at Tanjore, and in the form of Bangala it began to be used by Mohammedan writers in the latter part of the 13th century. Under Mohammedan rule the name applied specifically to the Gangetic delta, although the later conquests to the east of the Brahmaputra were eventually included within it. Under the English the name has at different periods borne very different significations. All the north-eastern factories of the East India company from Balasore, on the Orissa coast, to Patna, in the heart of Behar, belonged to the "Bengal establishment," and as British conquests crept higher up the rivers the term came to be applied to the whole of northern India. The presidency of Bengal eventually included all the British territories north of the Central Provinces, from the mouths of the Ganges and Brahmaputra to the Himalayas and the Punjab. The limits of the area bearing this designation have been reduced to their present dimensions by the formation of new provinces and the distribution of territory among them, viz., by the creation in 1836 of the North-Western Provinces now included with Oudh in the United Provinces, of Assam in 1874, and lastly of Behar and Orissa in 1912, when Bengal was made a presidency under a governor-in-council.

Physical Geography.—Bengal stretches from the Himalayas to the Bay of Bengal and, except for the mountains in Darjeeling district, the Sinchula hills in Jalpaiguri, the hill ranges of Chittagong, the Chittagong hill tracts, and Tippera, consists of a densely populated alluvial plain comprising the combined delta of the Ganges and Brahmaputra. A few slightly elevated tracts are

found, viz., in the west of the Burdwan division, where the ground rises towards the Chota Nagpur plateau, and the areas called the Barind covering 2,500sq.m. in the Rajshahi division and the Madhupur jungle in the Dacca division. Otherwise, Bengal is almost a level expanse intersected by numerous rivers with a very slight rise of level to the north. Calcutta, 86m. from the sea, is 21ft. above sea-level, while Siliguri, 300m. to the north of it, near the foot of the Himalayas, is only 400ft. above sea-level.

Throughout these hundreds of miles not a single hill rises above the surface of the plain, and there is hardly an undulation to be seen. The monotony of the scenery is relieved, however, by the fresh verdure of the country, the belts of trees lining the rivers and streams and the clumps of bamboo in which the villages are embowered. To the north a belt of forest stretches across the submontane country known as the Tarai, and to the south lie the Sundarbans, a maze of tidal rivers or estuaries, which enclose a number of swampy islands covered with dense forests growing in soft mud partly in and partly out of the water. In the northern districts the rivers debouching from the Himalayas receive the drainage from the country on either side, absorb broad tributaries, and flow southwards with an increasing volume. But near the centre of the province the rivers enter upon a new stage of their career. Their main channels bifurcate, and each new stream so created throws off its own set of distributaries to right and left. The country which they thus enclose and intersect forms the delta of Bengal. It stretches out as a vast dead level, in which the rivers find their velocity checked and their current no longer able to carry along the silt which they have brought down. The streams, accordingly, deposit their alluvial burden in their channels and upon their banks, so that by degrees their beds rise above the level of the surrounding country. In the depressions between them are basins, sometimes of such a low level that they are mere swamps. As the rivers creep farther down the delta they become more and more sluggish and their bifurcations and interlacings more complicated. The last scene of all is a wilderness of swamp and forest, where the net work of channels merges into the sea.

The physical characteristics of the greater part of the country have been determined by the eastward march of the Ganges. This great river, on entering Bengal, originally found its way to the sea by the channels of the Bhagirathi and Hooghly. As this channel silted up, the main stream, unable to deflect westwards owing to the rocky barrier of the Rajmahal hills, made its way eastward, cutting through the soft friable soil. In this way the Ichamati, Jalangi, and Matabhanga became in turn its chief distributary, until it found an outlet by the present channel of the Padma. The Brahmaputra, on the other hand, has moved westward. It formerly flowed south-east through the centre of Mymensingh to Bhairab Bazar, but in the beginning of the 19th century it broke westwards and joined the Ganges near Goalundo.

In the central portion of the Gangetic delta the process of land formation has practically come to an end owing to the Ganges having deserted its former channels. The beds of the rivers down which it passed have silted up and their mouths have become choked to a greater or less degree. Consequently they no longer receive the volume of water which, spilling over the banks in times of flood, used to enrich the land with silt deposit. Their own distributaries have similarly degenerated, and except during the rains they have little or no current and they have become reaches of stagnant water choked by vegetation. Land is no longer being built up and as it is deprived of the natural manuring it used to receive the productive capacity of the soil has been reduced. In the east, however, the country watered by the Padma, the Brahmaputra, and the Meghna is in active process of formation,

for every year during the rains the rivers overflow their banks and leave their silt upon the adjacent flats. Thousands of square miles are annually enriched by a top-dressing of virgin soil—a system of natural manuring which renders elaborate tillage unnecessary. During the annual inundation the rice fields to the extent of many hundreds of square miles are submerged. The country is then a sheet of water from which the village sites and scattered trees alone stand out.

Rivers.—The Ganges in its course through Bengal is known as the Padma and the Brahmaputra as the Jamuna. The other chief rivers are the Meghna, Tista, Damodar, Rupnarain and Hooghly. The Meghna bears the name of the Surma in the upper portion of its course. It receives the Padma, and with it the waters of both the Ganges and the Brahmaputra, between Narayanganj and Chandpur. It then expands into a broad estuary, which near the Bay of Bengal encloses two large islands Hatia and Dakshin Shahbazar; the neighbouring island of Sandwip was probably formed by its silt. The Tista drains the state of Sikkim and, flowing through North Bengal, joins the Brahmaputra in Rangpur district. It was formerly an affluent of the Ganges but deserted its old channel and cut out its present bed in 1787. The Damodar (368m. long) flows from Chota Nagpur through west Bengal and joins the Hooghly shortly before it falls into the sea. It drains an area of 2,500sq.m. and is liable to sudden floods: in 1913 it laid 1,200sq.m. in Bengal under water and destroyed or damaged the houses of 250,000 people. The Rupnarain is another river of western Bengal and also an affluent of the Hooghly. The Hooghly is simply a continuation of the Bhagirathi, that name being applied to the river in the last 120m. of its course. Its importance as a highway of commerce is out of all proportion to its length.

Climate.—The climate is distinguished by high humidity caused by moist winds from the Bay of Bengal, especially during the rainy season. The proportion of vapour in the air then ranges from 83 to 88 (100 representing saturation). The western districts come within the range of hot west winds from the Gangetic valley, but they do not penetrate further. A maximum temperature of 117° has been recorded at Midnapore and Bankura. In the province as a whole the annual mean varies from

80° at those two places to 75° at Jalpaiguri. The coolest month is January, when the mean is 65°. The annual average rainfall varies from 50 to 75in. in west, south-west and centre of Bengal, and from 75 to 120in. elsewhere, except at the foot of the Himalayas, where the fall is over 200 inches.

Cyclones from the Bay of Bengal occasionally cause widespread disaster, especially if accompanied by a storm-wave. The cyclone of 1864 caused 48,000 deaths and that of 1876, with an awful storm-wave, 100,000. In more recent times the cyclone of 1919 killed over 3,000 persons and 40,000 cattle, besides doing enormous damage to property.

Geology.—Bengal is of little interest from a geological point of view, for the greater part of it is occupied by alluvial deposits. The bulk consists of new alluvium; old alluvium is found in the Barind and the Madhupur jungle. The great thickness of the Gangetic alluvium is shown by a borehole at Calcutta, which was carried to a depth of 481ft. without entering any marine deposit. The Gondwana system of deposits is represented in the Burdwan and Bankura districts, where the Raniganj strata contain valuable coal measures, while ironstone shales yield iron ore.

The People.—In respect of population no less than of physical geography Bengal is remarkably homogeneous, for 92% of the people belong to the distinctive Bengali races speaking the Bengali

A NATIVE PORTER IN BENGAL, A LAND WHERE HUMAN LABOUR IS CHEAPER THAN THAT OF ANIMAL OR MACHINE

language. It draws largely on other parts of India for its labour force, and the immigrant population accounts for the presence of 1½ millions speaking Hindi and Urdu. The province of Behar and Orissa alone sends 1½ million of its people to Bengal. Apart from immigrants, the constituents of the population other than indigenous Bengalis are few. The number of Arakanese speakers is 57,000 and of Nepalese 93,000, while the Tipperas and Chakmas, hill tribes in the southeast, number 154,000 and 78,000. Mohammedans, representing 54% of the population, outnumber the Hindus by 4½ millions and account for one-third of the total number of Mohammedans in India. They are increasing more rapidly than the Hindus, and their religious life is stimulated by revivalist movements, notably in eastern Bengal, where in many parts one cannot travel a mile without seeing a mosque, often a humble structure of corrugated iron. Buddhism is the faith of 276,000 persons, mainly in the Chittagong division and Darjeeling. Christianity is professed by 149,000 persons. The country is densely populated considering its dependence on agriculture and the absence of large industries except in a few areas. The average density is 579 per sq.m. (compared with 649 in England and Wales) and rises to over 1,000 in a rural block of 9,000sq.m. in eastern Bengal.

Agriculture.—The staple crop of the province is rice, which, being a semi-aquatic plant requiring a thin covering of water for successful growth, finds almost ideal conditions in Bengal. It is cultivated on four-fifths of the cropped area. There are three harvests in the year—the *boro*, or spring rice; *aus*, or autumn rice; and *aman*, or winter rice. Of these the last or winter rice is by far the most extensively cultivated and forms the great harvest of the year. In marshy areas a species is grown which is adapted to their peculiar conditions, for its growth keeps pace with the rise of the water. The stem grows to a height of 10 to 20ft. and the grains are reaped from boats. Bengal is the most important rice-producing area in northern India and raises more than enough for local consumption, the balance being exported overseas and to other parts of India. On the other hand, the cultivation of pulses, which are grown on 7% of the area under food crops, is not sufficient for the needs of the people and large quantities have to be imported from Behar and the United Provinces. Bengal has almost a monopoly of jute cultivation, which yields an immensely valuable crop, as the sacks of the world are made from its fibre. The area devoted to it expands or contracts according to the market price, but the normal area is over two million acres. Oil seeds, such as rape, mustard and linseed, cover 1½ million ac and sugar cane 250,000 acres. Bengal is the chief tobacco-growing province in India; the plant is cultivated chiefly in Ranpur, Jalpaiguri and Cooch Behar; the leaf supplies local demands and is also exported to Burma, where it is converted into the well-known Burma cheroots. Other special and valuable crops are cinchona, which is grown by Government for quinine manufacture in Darjeeling and the narcotic-producing hemp called *ganja* (*Cannabis sativa*), which is grown in a carefully regulated area in the Rajshahi district. Darjeeling and Jalpaiguri districts are important tea-producing districts with 300 tea gardens; tea is also grown on a small scale in Chittagong.

Manufactures and Mines.—There are three industrial areas in Bengal. The first is of a semi-agricultural character, consisting of the tea gardens of Darjeeling and Jalpaiguri, which manufacture as well as grow tea. The second consists of the west of the Burdwan district, where metallurgical industries have been established in close proximity to the Raniganj coal field. This field, in which the first Indian coal mine was opened in 1921, was till 1905 the most important in India but since then has been surpassed by the Jharia field in Behar and Orissa. It extends into Bankura, Birbhum and Manbhum, and the Bengal portions had an output in 1921 of 4½ million tons, raised in 268 mines. The iron ore found in the neighbourhood was first worked on a large scale in 1874. The largest pottery works in Bengal are also in this area. The third industrial tract is found along the banks of the Hooghly river, which are studded with tall factory chimneys. Here numerous manufacturing concerns are clustered together, such as jute mills, cotton mills, oil mills, flour mills, engineering

workshops, etc. Jute is now the important manufacture in Bengal, employing (1925) 300,000 operatives and consuming about two-thirds of the jute produced in the province.

Administration.—The administration of the province, or, as it is officially designated, the Presidency of Fort William in Bengal, is conducted by a governor, acting in some branches with an executive council of three members and in others with two ministers. The legislative council consists of 139 members, of whom 113 are elected. For administrative purposes the province is divided into 27 districts, which are grouped in five divisions, each under a commissioner, viz., Burdwan, Presidency, Dacca, Chittagong and Rajshahi.

Commerce.—The sea-borne trade of Bengal is almost entirely concentrated at Calcutta, which serves as the chief port, not only for Bengal but also for Assam, the United Province, and Behar and Orissa. The port of Chittagong is, in a minor degree, an outlet for the produce of Assam and of adjoining districts, but its trade is not comparable with that of Calcutta, which has practically a monopoly of the exports of jute and coal, and is the main distributing centre for imports brought from overseas. The principal imports are cotton piece goods, railway materials, metals and machinery, oils, sugar, cotton, twist and salt; and the principal exports are jute, tea, hides, rice, oil-seeds and lac. The inter-provincial trade is mostly carried on with Behar and Orissa, Assam, the United Provinces and the Central Provinces. The frontier trade of Bengal is registered with Nepal, Sikkim, Tibet and Bhutan, but except with Nepal the amount is insignificant. There are few commercial centres of any importance apart from Calcutta and Chittagong except those connected with the industrial area in Burdwan, such as Asansol and Raniganj, and river marts connected with the jute collecting trade, such as Narayanganj, Madaripur and Chandpur. In the interior, most of the towns merely supply local needs, and much of the trade is transacted in weekly or bi-weekly village markets.

Railways and Transport.—Bengal is well supplied with railways, of which three have the seaport of Calcutta as the centre of the system. The East Indian connects Bengal with northern India, the Bengal-Nagpur with the Central Provinces and Madras, and the Eastern Bengal State railway with Assam and, by connecting with the Bengal and north-western railway, with the north Gangetic districts of Behar and Orissa and the United Provinces. The Assam-Bengal railway, with its terminus at Chittagong, also links the south-east of the province with Assam.

Rivers and other waterways still carry a large part of the traffic of Bengal, especially in the delta. Inland steamer services ply along the Ganges, Brahmaputra, and other rivers, and eastern Bengal is connected with Calcutta by a route through the Sundarbans consisting of waterways and navigable channels (some artificial) of a total length of nearly 1,200 miles. In many parts of the provinces the rivers, streams and creeks are the natural means of communication; in eastern Bengal most villages can be reached by boats and some by boats alone.

HISTORY

The northern part of the province of Behar (*q.v.*) constituted the ancient kingdom of Magadha, the nucleus of the successive great empires of the Mauryas, Andhras and Guptas. Its chief town, Patna, is the ancient Pataliputra (the Palimbothra of the Greeks), once the capital of India. The Delta or southern part of Bengal lay beyond the ancient Sanskrit polity, and was governed by a number of local kings belonging to a pre-Aryan stock. The Chinese travellers, Fa Hien in the 5th century, and Hsüan Tsang in the 7th century, found the Buddhist religion prevailing throughout Bengal, but already in a fierce struggle with Hinduism, which ended about the 9th or 10th century in the general establishment of the latter faith. Until the end of the 12th century Hindu princes governed in a number of petty principalities, till, in 1199, Mohammed Bakhtiyar Khilji was appointed to lead the first Muslim invasion into Bengal. The Mohammedan conquest of Behar dates from A.D. 1197. From this time until 1340 Bengal was ruled by governors appointed by the Mohammedan emperors. From 1340 to 1539 its governors

asserted a precarious independence. From 1540 to 1576 Bengal passed under the rule of the Pathan or Afghan dynasty but on the overthrow of this house by Akbar, Bengal was incorporated into the Mogul empire, and administered by governors appointed by the Delhi emperor, until the treaties of 1765, which placed Bengal, Behar and Orissa under the administration of the East India Company. The company formed its earliest settlements in Bengal in the first half of the 17th century. In 1696 factors purchased from the grandson of Aurangzeb the villages which have since grown up into Calcutta. During the next 50 years the British had a long and hazardous struggle alike with the Mogul governors of the province and the Mahratta armies which invaded it. In 1756 this struggle culminated in the great outrage known as the Black Hole of Calcutta, followed by Clive's battle of Plassey and capture of Calcutta, which avenged it. During the subsequent years of confused fighting, British military supremacy was established in Bengal, and procured the treaties of 1765, by which the provinces of Bengal, Behar and Orissa passed under British administration. Warren Hastings (1772-85) consolidated the British power and Lord Teignmouth (1786-93) formed a regular system of Anglo-Indian legislation. The landholders under the native system had started, for the most part, as collectors of the revenues, and gradually acquired certain prescriptive rights as quasi-proprietors of the estates entrusted to them by the Government. In 1793 Lord Cornwallis declared their rights perpetual (the Permanent Settlement of the Land Revenue). But the Cornwallis code, while defining the rights of the proprietors, failed to give adequate recognition to the rights of the under-tenants, and the cultivators. After half a century of rural disquiet, the rights of the cultivators were at length carefully formulated by Act X. of 1850. This measure, now known as the land law of Bengal, effected for the rights of the under-holders and cultivators what the Cornwallis code in 1793 had effected for those of the superior landholders. In Bengal the Indian Mutiny (*q.v.*) began at Barrackpore, was communicated to Dacca in Eastern Bengal, and for a time raged in Behar, producing the memorable defence of the billiard-room at Arrah by a handful of civilians and Sikhs. Since 1858, when the country passed to the crown, the history of Bengal has been one of steady progress. Five great lines of railway have been constructed, and the coalfields and iron ores have opened up prospects of still further internal development.

During the decade 1801-1901 Bengal escaped the rigours of the famine and plague which afflicted central and western India, though there was a serious outbreak of plague at Calcutta, and in Patna in 1900-1. The earthquake of June 12, 1897, which had its centre of disturbance in Assam, was felt throughout Eastern and northern Bengal. Far more destructive to life was the cyclone and storm-wave that broke over Chittagong district on the night of Oct. 24, 1897. Apart from damage to shipping and buildings, the low-lying lands along the coast were completely submerged, and in many villages half the inhabitants were drowned. The loss of human lives was reported to be about 14,000. In 1905 it was realized that Bengal had become too unwieldy for the administration of a single lieutenant-governor and the province was divided, in spite of bitter Hindu opposition. All the districts east of the Brahmaputra were constituted as a separate province (Eastern Bengal), and as a protest there was a firm boycott of British goods and demonstrations by the "National Volunteers" were common.

When Sir J. Bampfylde Fuller took up the administration as first lieutenant-governor of Eastern Bengal the usual addresses of welcome were omitted and Hindus abstained from paying the customary calls. After six months, however, it seemed as though things were settling down and it became obvious that the earlier agitation was largely artificial. In August, however, the lieutenant-governor resigned owing to a difference with the central government. Acting on a report of Dr. P. Chatterji, inspector of schools, dated Jan. 2, 1906, the lieutenant-governor, on Feb. 10 addressed a letter to the registrar of Calcutta university recommending that the privilege of affiliation to the university should be withdrawn from the Banwarilal and Victoria high schools at Sirajganj

in Pabna, as a punishment for the seditious conduct of both pupils and teachers. Apart from numerous cases of illegal interference with trade and of disorder in the streets reported against the students, two specific outrages had occurred on Nov. 15: the raiding of a cart laden with English cloth belonging to Marwari traders, and a cowardly assault by some 40 or 50 lads on the English manager of the Bank of Bengal. All attempts to discover and punish the offenders had been frustrated by the refusal of the school authorities to take action. The secretary of the home department of the Government of India, however, refused to support Sir Bampfylde Fuller, who at once tendered his resignation (July 15), which was accepted by the viceroy on Aug. 3. By the Anglo-Indian press the news was received with something like consternation, the *Times of India* describing the resignation as one of the gravest blunders ever committed in the history of British rule in India, and as a direct incentive to the forces of disquiet, disturbance and unrest. On Aug. 7 the day of Sir Bampfylde Fuller's departure from Dacca, a mass-meeting of 30,000 Mohammedans was held, which placed on record their disapproval of a system of government "which maintains no continuity of policy," and expressed its feeling that the lowering of British prestige must "alienate the sympathy of a numerically important and loyal section of His Majesty's subjects." On Aug. 8, Calcutta was the scene of several large demonstrations at which the Swadeshi vow was renewed, and at which resolutions were passed declining to accept the partition as a settled fact, and resolving on the continuance of the agitation.

In 1910 the Government of the remainder of Bengal with Behar and Orissa was placed in the hands of the lieutenant-governor in council (three members). In accordance with the Government of India Act (1910), the administration was, in 1921, vested in the governor with four executive councillors, two being Indians, for the "reserved" subjects, and in the governor with three Indian ministers for the "transferred" subjects. By an act of 1923, the Calcutta corporation was reconstituted with a mayor, chief executive officer and other officials, all of whom are elected by the corporation. Bampfylde Fuller*, lieutenant-governor, etc (Cd. 1242); L. J. S. O'Malley, *History of Bengal, Bihar and Orissa under British Rule* (1925).

BENGAL, BAY OF, part of the Indian Ocean, lying between peninsular India and Burma. The 100-fathom line runs parallel to the Coromandel coast some 50m. away, and encloses the Andaman and Nicobar islands, submerged continuations of the Arakan ranges, on the east. Opposite the mouth of the Ganges the submarine platform is greatly extended. The bay receives many large rivers: the Ganges and Brahmaputra on the north, the Irrawaddy on the east, and the Mahanadi, Godavari, Kistna and Cauvery on the west; all remarkable for their deltas. The Deccan coast provides no harbours, Madras having a mere open roadstead, but on the east the drowned coast has given many good ports, such as Akyab, Moulmein and Rangoon. Islands include the Andaman, Nicobar and Mergui groups. Cheduba and other islands off the Burmese coast are remarkable for a chain of mud volcanoes, occasionally active.

BENGALI LANGUAGE AND LITERATURE. The Bengali language is one of four forms of speech composing the eastern group of the Indo-Aryan Languages (*q.v.*).

Bengali is spoken in the province of Bengal proper; *i.e.*, in, and on both sides of, the delta of the Ganges. The name "Bengali" is an English word, derived from the English word "Bengal." The language is known as *Bangga-Bhāṣā*, or the language of *Bangga*; *i.e.*, "Bengal."

It is an immediate descendant of Māgadhi Prakrit (*see* PRAKRIT), which spread from south Behar in three lines southwards, where it developed into Oriya; south-eastwards into Bengal proper, where it became Bengali; and eastwards, through northern Bengal, into Assam, where it became Assamese. Thus

the language of northern Bengal, though usually and conveniently treated as a dialect of Bengali, is, in reality, a connecting link between Assamese and Bihari, the language of Behar. Northern Bengali and Assamese often agree in their grammar with Oriya, as against standard Bengali.

Bengali has two main dialects, a western and an eastern, the former being the standard. The eastern dialect has a tendency to disaspiration, the pronunciation of *c* as *ts*, of *ch* as *s*, and of *j* as *z*. In the northern part of the tract a medial *r* is often elided, and in the extreme east there is a broader pronunciation of the vowel *a*, like that in the English word "ball," *k* is sounded like the *ch* in "loch," and both *c* and *ch* are pronounced like *s*. The letter *p* is often sounded like *w*, and *s* like *h*; the latter, when initial, is dropped. The distinction between cerebral and dental letters is lost. In the south-east, near Chittagong, the local dialect is practically a new language and is unintelligible to a man from western Bengal. Throughout the eastern districts there is a strong tendency to epenthesis; e.g., *kāli* is pronounced *kāil*.

Abbreviations used: A.=Assamese, Bg.=Bengali, O=Oriya, Pr.=Prakrit, Mg. Pr.=Māgadhi Prakrit, Skr.=Sanskrit. (In transliteration, *c* has the sound of *ch*, in church. Thus Caitānya, Caṇḍī, are pronounced Chaitanya, Chaṇḍī.)

Vocabulary.—Literary Bengali abounds in *tatsamas*, words borrowed in modern times from Sanskrit (see INDO-ARYAN LANGUAGES), which have intruded themselves into the speech of the educated so that, in the literary language, when a genuine Bengali or *tadbhava* word is used in literature it is frequently not put into writing, but the corresponding learned *tatsama* is written in its place, although the *tadbhava* is read.

Phonetics.—The vowel *a* is sounded like the *o* in "hot," and is represented in the present article by *ō*. The pronunciation of this frequently recurring vowel gives a tone to the general sound of the languages. In Bg. a final vowel preceded by a single consonant is generally not pronounced for nouns, a final *a* being freely sounded in adjectives and verbs. The sound of such a final *a* is that of the second *o* in "promote." In Bg. a medial *a* sometimes has the sound of the first *o* in "promote." In eastern Bg. a medial *a* is often sounded like the *a* in "ball," and is then transliterated *ā*. *Ā* has preserved as a rule its proper sound of *a* in "father." The distinction between *i* and *ī* and between *u* and *ū* is everywhere lost in pronunciation, although in *tatsama* words the Sanskrit spelling is followed in literature. In Bg. the vowel *ē* may be long or short and the syllable *ya* preceded by a consonant has the sound of a short *e*, and is often pronounced like the *a* in the German *Mann*, a sound here phonetically represented by *ā*. The syllable *yā*, when following a consonant, has this *ā*-sound, so that the English word "bank" is written *byānk* in Bengali characters. *ō* in Bg., when it does not carry the accent, is shortened to the sound of the first *o* in "promote," a sound also sometimes taken by a medial *a*. The diphthongs *āi* (in *tatsamas*; i.e., the Skr. *āi*) and *ai* (in *tadbhavas*) are sounded like *oi* in "oil" in Bg. and the diphthongs *āū* and *au* are sounded like the *au* in the German *Haus*. In colloquial Bg. the two syllables *āi* often have the sound of *ē*.

In eastern Bengal *k* has often the sound of *ch* in "loch." The tendency to pronounce the consonants *c* and *ch* like *s*, and *j* and *jh* as *zh* (i.e., the *s* in "pleasure") or (when final) *z*, is observable in Bg., though usually considered vulgar. In parts of eastern Bengal *c* is pronounced like *ts*. In eastern Bg. there is a strong tendency to pronounce both dentals and cerebrals as semi-cerebrals, as in the neighbouring Tibeto-Burmans. In Bg. *ṇ* has universally become *n*. *ṽ* is usually pronounced as *j*, unless it is a merely euphonic bridge to avoid a hiatus between two vowels, as in *kariyā* for *kari-ā*. When *y* is the final element of a conjunct consonant, in Bg. (except in the south-east) it is very faintly pronounced. In compensation the preceding member of the conjunct is doubled and the preceding vowel is shortened if possible, thus *vākya* becomes *bākkyō*. *M* and *v* when similarly situated are altogether elided in Bg. *R* is generally pronounced correctly, except that when a member of a compound it is often not pronounced in colloquial Bg. In north-eastern Bengali a medial *r* is commonly dropped. The vulgar commonly confound *n* and *l*. The old cerebral *ḷ* of Pr. has disappeared in Bg. The semi-vowel *v* (*w*)

becomes *ō* in Bg.; when Bg. wishes to represent a *w*, it has to write *ōyā*. Bg. pronounces all un compounded sibilants as if they were *ś*, like the English *sh* in "shin," as in Mg. Pr. (see PRAKRIT). In eastern Bg. *s* becomes frankly *h* and is then often dropped. The compound *kṣ* is everywhere treated as if it were *khy*. In colloquial Bg. there is a tendency to disaspiration. In eastern Bg. there is a cockney tendency to drop *k*.

Declension.—Sex is distinguished either by the use of qualifying terms, such as "male" or "female," or by the employment of different words, as in the case of our "bull" and "cow." The plural number is almost always denoted by the addition of some word meaning "many" or "collection" to the singular, although sometimes a true plural is used in the case of nouns denoting human beings. Case was originally indicated by postpositions (see INDO-ARYAN LANGUAGES), which in many instances have been joined to the noun, forming one word with it.

A noun often takes *ē* (*e*) in the nominative singular, when it is the subject of a transitive verb. The nominative plural may, in the case of human beings, be formed by adding *ā* to the genitive singular. The same is the case with the pronouns.

Pronominal suffixes are freely used in the conjugation of verbs.

The adjective does not change for gender, for number or for case.

The personal pronouns have new nominatives formed from the oblique base. In the first and second persons the singulars have fallen into disuse in polite conversation, and the plurals are used honorifically for the singular, as in the case of the English "you" for "thou." For the plural, new plurals are formed from the new singular (old plural) bases. The Bg. pronouns are, *mui* (old), I; *āmi* (modern), I; *tui* (old), thou; *tumi* (modern), thou; *sē*, *tinī*, he; *ē*, *inī*, this; *ō*, *unī*, that; *jē*, *jinī*, who; *kē*, who?; *kī*, what?; *kōn*, what (adjective)?; *kēha*, anyone; *kichu*, anything; *kōna*, any.

All these pronouns have plurals and oblique forms to which the case suffixes are added.

Conjugation.—Colloquial Bg. differs most from the literary dialect in the conjugation of the verb. There is no distinction between singular and plural. Most of the old singular forms have survived in a non-honorific sense, but are rarely employed in polite language except in the third person. The old plural forms are generally employed for the singular also.

BIBLIOGRAPHY.—J. Beames, *Comparative Grammar* (1894); *Linguistic Survey of India*, vol. v., parts i. and ii (Calcutta, 1903), with copious bibliography; Dinesh Chandra Sen, *History of the Bengali Language and Literature* (1911); S. Chatterji, *The Origin and Development of the Bengali Language* (1926).

BENGALI LITERATURE

The earliest Bengali writer is the Vaishnava poet Caṇḍī Dās, A.D. 1400. His language does not differ much from modern Bengali. He founded a school of poets who wrote hymns in honour of Krishna, many of whom, in later times, became connected with the 16th-century religious revival instituted by Caitanya. In the 15th century Kāśī Rām translated the *Mahābhārata* and Kṛtibās Ojhā the *Rāmāyaṇa*. The principal figure of the 17th century was Mukunda Rām who left two admirable poems, *Caṇḍī* and *Śrīmanṭa Saudāgar*. Parts of the former have been translated by Prof. Cowell into English verse. With Bhārat Candra and his much admired but artificial *Bidyā Sundar* (18th century), the list of old Bengali authors closes. They wrote in genuine nervous Bengali, and the conspicuous success of many of them disproves the contention that modern literary Bengali needs the help of its imported Sanskrit vocabulary to express anything but simple ideas. Modern literary Bengali arose early in the 19th century, after the revival of Sanskrit learning in Calcutta, under the influence of the English college of Fort William. It became increasingly the slave of Sanskrit, but it had some excellent writers, notably the late Bankim Candra, whose novels have been translated into many languages. Even he, however, sometimes laboured under Sanskrit fetters, and it was only comparatively recently that a partial reaction, largely influenced by Sir Rabindranath Tagore (*q.v.*), set in in favour of a more natural language. Since then several writers of distinction have arisen.

Oriya Literature.—This does not go back beyond the 16th century, though examples of the language are found in inscriptions of the 13th century. Nearly all the works are connected with the history of Krishna, and the 16th-century translation of the *Bhāgavata Purāna* into Oriya still exercises great influence on the masses. Dīna Kṛṣṇa Dās (17th century) was the author of a popular work entitled *Rasa Kallola*, which deals with the early life of Krishna. Every verse begins with the letter *k*. Upēndra Bhañja, Rājā of Gumsur, a petty hill State, is the most famous of Oriya poets, and was the most prolific. His work is insipid to European taste, and often unintelligible or obscene. Oriya poetry has always been an artificial production, the work of *paṇḍits*, bound by rules of Sanskrit rhetoric, and appealing only to the learned.

Assamese Literature.—The Assamese are justly proud of their national literature. It had an independent growth, and its strength, unlike other Indian literatures, lies in history. The chronicles go back for 600 years, and a knowledge of their contents is part of the education of the upper classes. In poetry, the 15th-century Vaishnava reformer, Śankar Dēb, was a voluminous writer. His best known work is a translation of the *Bhāgavata Purāna*. About the same time Ananta Kandali translated the *Mahābhārata* and the *Rāmāyaṇa*. Medicine was much studied, and there are translations of all the principal Sanskrit medical works. Forty or 50 vernacular dramatic works are still acted. Some date back to the time of Śankar Dēb.

BENGASI (anc. *Euesperides* or *Hesperides-Berenice*), a seaport in Italian North Africa. Pop. (1921) 32,600, 5,000 of whom are Italians, not including the garrison. It is on a narrow strip of land between the Gulf of Sidra and a salt marsh, in 30° 7' N. lat. and 20° 3' E. long. Besides modern buildings it has one or two edifices of some interest, notably an ancient castle. The harbour is accessible only to vessels of light draught, but over £500,000 have been provided for its improvement. The export trade is largely in barley, shipped to British and other maltsters. The Sudan produce (ivory, ostrich feathers, etc.) formerly brought to Bengasi by caravan, has now been almost wholly diverted to Khartoum, though Bengasi is the starting point of the shortest route to Wadai. The neighbouring coast is frequented by Greek and Italian sponge-fishers. There is regular communication by steamer with Syracuse and Derria, and railways run north-east via El Abiar (37m.) to El Merg (66m.) and south-east to Sobik (35m.).

Founded by the Greeks of Cyrenaica under the name Hesperides, the town received from Ptolemy III the name of Berenice in compliment to his wife. The ruins of the ancient town, which superseded Cyrene and Barca as chief place in the province after the 3rd century A.D., are now nearly buried in the sand, which has invaded this once fertile region; but there are numerous rock cut tombs of the Ptolemaic and Roman period, when there was a considerable Jewish colony. Nor are there any traces of the buildings attributed to Justinian, who is said to have fortified it. The modern town lies south-west of the original site (For history see CYRENAICA.)

BENGEL, JOHANN ALBRECHT (1687–1752), Lutheran divine and scholar, was born at Winnenden, Württemberg, on June 24, 1687. He studied at the University of Tübingen and from 1713 to 1741 was master (*Klosterpræceptor*) of the *Klosterschule* at Denkendorf, a seminary for candidates for the ministry established in a former monastery. To these years, the period of his greatest intellectual activity, belong many of his chief works. In 1741 he was appointed General Superintendent at Herbrechtingen, where he remained till 1749, when he was raised to the dignity of consistorial counsellor and prelate of Alpirspach, with a residence in Stuttgart. He died at Stuttgart on Nov. 2, 1752.

The works on which Bengel's reputation rests as a biblical scholar and critic are his edition of the Greek New Testament, and his *Gnomon* or *Exegetical Commentary* on the same.

His edition of the Greek Testament based on 20 mss. 12 of which he had himself collated, was published at Tübingen in 1734, and at Stuttgart in the same year, but without the critical apparatus. The text was followed by a critical apparatus, the first

part of which consisted of an introduction to the criticism of the New Testament, in the thirty-fourth section of which he laid down and explained his celebrated canon, "*Proclivi scriptioni præstat ardua*" ("The difficult reading is to be preferred to that which is easy"), the soundness of which, as a general principle, has been recognized by succeeding critics. The second part of the critical apparatus was devoted to a consideration of the various readings, and here Bengel adopted the plan of stating the evidence both *against* and *in favour* of a particular reading. Bengel was the first definitely to propound the theory of families or recensions of mss. His investigations had led him to see that a certain affinity or resemblance existed amongst many of the authorities for the Greek text—mss., versions, and ecclesiastical writers; that if a peculiar reading, e.g., was found in one of these, it was generally found also in the other members of the same class; and this general relationship seemed to point ultimately to a common origin for all the authorities which presented such peculiarities. Although disposed at first to divide the various documents into three classes, he finally adopted a classification into two—the African or older family of documents, and the Asiatic, or more recent class, to which he attached only a subordinate value. In answer to the many strictures passed on his work Bengel published a *Defence of the Greek Text of His New Testament*, which he prefixed to his *Harmony of the Four Gospels* (1736).

The work on which Bengel's reputation as an exegete is mainly based, is his *Gnomon Novi Testamenti, or Exegetical Annotations on the New Testament* (1742). It was the fruit of twenty years' labour, and exhibits with a brevity of expression, which, it has been said, "condenses more matter into a line than can be extracted from pages of other writers," the results of his study. The principles of interpretation on which he proceeded were, to import nothing *into* Scripture, but to draw *out of* it everything that it really contained, in conformity with grammatico-historical rules; not to be hampered by dogmatical considerations; and not to be influenced by the symbolical books. Bengel's *Gnomon* passed through many editions and was translated into German and into English.

See Oskar Wachter's *J. A. Bengels Lebensabriss*; J. C. F. Burk (*J. A. Bengels Leben und Wirken*), translated into English by Rev. R. F. Walker (London, 1837), and E. Nestle, *Bengel als Gelehrter* (1893).

BENGUELLA: see ANGOLA.

BENÍ (EL BENÍ), a lowland department of north-eastern Bolivia. Pop. in 1927, 50,265 including 6,000 wild Indians; area 95,354 sq. m. The "Llanos de Mojos," famous for their flourishing Jesuit mission settlements of the 17th and 18th centuries, occupy the eastern part of this department and are still inhabited by an industrious peaceful native population, devoted to cattle raising and primitive methods of agriculture. Cattle and forest products, including rubber and coca, are exported to a limited extent. The capital, Trinidad (pop. in 1927, 6,000), is about six miles from the Mamoré river in an open fertile country, and was once a flourishing Jesuit mission.

BENÍ, a river of Bolivia, a tributary of the Madeira, rising in the elevated Cordilleras near the city of La Paz and at first known as the Rio de La Paz, and flowing east, and north-east, to a junction with the Mamoré at 10° 20' S. lat. to form the Madeira. Fully one-half of its length is through the mountainous districts of central Bolivia, where it is fed by a large number of rivers and streams from the snowclad peaks, and may be described as a raging torrent. Below Reyes its course is through the forest-covered hills and open plains of northern Bolivia, where some of the old Indian missions were situated. The lower river is navigable for 217 m. from Reyes to the Esperanza rapids, 18 m. above its confluence with the Mamoré, where a fall of 20 ft. in a distance of 330 yds. obstructs free navigation. Its principal affluent is the Madre de Dios, or Mayu-tata, which rises in the eastern Cordilleras about 35 m. east of Cuzco, and flows in an east and north-east direction through northern Bolivia to a junction with the Bení 120 m. above its mouth. The principal tributaries of the Madre de Dios are the Inambari and Paucartambo, both large

ivers, and the Chandless, Marcapata, and Tambopata. In length and size of its tributaries the Madre de Dios is a more important river than the Beni itself, and is navigable during the wet season to the foot of the Andes, 180 m. from Cuzco.

BENI AMER: see BEJA.

BENI HELBA: see BAKKARA.

BENIN, the name of a country, city and river of British West Africa, west of the main channel of the lower Niger, forming part of Southern Nigeria. The name was formerly applied to the coast from the Volta, in $0^{\circ} 40' \text{ E.}$, to the Rio del Rey, in $8^{\circ} 40' \text{ E.}$, and included the Slave Coast, the whole delta of the Niger and a small portion of the country to the eastward. Some trace of this earlier application remains in the name "Bight of Benin," still given to that part of the sea which washes the Slave Coast, whilst up to 1894 "Benin" was used to designate the French possessions on the coast now included in Dahomey.

In its restricted sense Benin is the country formerly ruled by the king of Benin city. This area, at one time very extensive, gradually contracted as subject tribes and towns acquired independence. The coast-line held by Benin had passed out of its sovereignty by the middle of the 19th century. In physical characteristics, climate, flora and fauna, Benin in no way differs from the rest of the southern portion of Nigeria (*q.v.*). Benin river (known also as the Jakri outlet), though linked to the Niger system by a network of creeks, is an independent stream. It enters the Atlantic in about $5^{\circ} 46' \text{ N.}$, $5^{\circ} 3' \text{ E.}$, and at its mouth, which is obstructed by a sand bar, is 2 m. wide. The river is navigable by small steamers up to Sapele, a town on the south bank immediately below the junction of its head streams (the Ethopie and the Jamieson). The Ologi and Gwato creeks enter the Benin on the right or north bank, and on the same side (8 m. above the mouth of the river) a channel, the Lagos creek, 170 m. long, branches off to the north-west, affording a waterway to Lagos. From the south or left bank of the Benin the Forcados mouth of the Niger can be reached by the Nana creek. By this route ships drawing 16' 6" can reach Sapele.

The Beni are a pure negro tribe, speaking a distinct language, but having many characteristics common to those of the Yoruba- and Ewe-speaking tribes. Like the Ashanti and Dahomeyans the Beni had a well-organized and powerful government and possessed a culture rare among negro races.

Benin city (pop. about 35,000) is in a clearing of the forest, 25 m. from the river-port of Gwato, on Gwato creek. Of the ancient city, whose buildings excited the admiration of travellers in the 17th and 18th centuries, scarcely a trace remains. The houses are neatly built of clay, coloured with red ochre, and frequently ornamented with rudely carved pillars.

Since the abolition of the slave trade the chief exports of the country are palm-oil and timber. Among the articles prized by the Beni is coral, of which the chiefs wear great quantities. After the British occupation, an extensive trade developed in oil, kernels, timber, ivory and rubber. In the rubber and timber industries great strides have been made.

HISTORY

Benin was one of the most highly organized of the negro states on the West Coast of Africa; it shared with Dahomey and Ashanti an unenviable notoriety for the system of human sacrifices (the "customs" as they were called), which marked their religious and court ceremonies. The Portuguese discovered Benin about the year 1485, and they carried on with the Bini (less correctly Benis) a brisk trade in slaves, the slaves being taken to Elmina and sold to the natives of the Gold Coast. The Portuguese found Benin a powerful state, and so it continued until about the middle of the 19th century. Europeans in the 17th century spoke of it as Great Benin; colonists from Benin founded the ports of Lagos and Badagry. While the area of the kingdom was small (somewhat larger than Wales), its influence was very wide and is said to have extended west as far as Sierra Leone and south to the Congo river. This arose from the belief that the chief spirit or "juju" of Benin was the most powerful in West Africa. This spirit dwelt in Benin city which was the seat of a

theocracy of priests. The *oba* or king, though nominally supreme, appears to have often been a puppet in the hands of the priests. Revered as a species of divinity, the king seldom left the enclosure surrounding his palace. The worship of the "juju" demanded human sacrifices to an appalling extent, the usual form of sacrifice being crucifixion. Although blood flowed so freely the people do not appear to have indulged in wanton cruelty, and it is stated that they usually stupefied the victims before putting them to death. The Bini were more civilized in several respects than the neighbouring peoples. They were especially noted for their brass and ivory work. Although they may have owed something to their contact with the Portuguese, their culture was essentially native, and their dealings with white men were almost confined to matters of commerce. The Portuguese withdrew from the coast in the 18th century, but one of the most striking proofs of their commercial influence is the fact that a corrupt Lusitanian dialect was spoken by the older natives up to the last quarter of the 19th century.

The first British expedition to Benin was in 1553; after that time a considerable trade grew up between England and that country, ivory, palm-oil and pepper being the chief commodities exported from Benin. The Dutch afterwards established "factories" and maintained them for a considerable time, chiefly with a view to the slave trade. A trading station founded by the French in 1788 was destroyed by the British in 1792. In 1863 Sir Richard Burton, then British consul at Fernando Po, went to Benin to try to put a stop to human sacrifices, an attempt in which he did not succeed. At that time the decline in power of the kingdom of Benin was obvious, and the city was in a decaying condition. In 1885 the coast-line of Benin was placed under British protection, and steps were taken to enter into friendly relations with the king. In March 1892 Captain (later Sir) H. L. Gallwey, British vice-consul, succeeded in concluding a treaty with the king, Overami. The treaty, however, proved of no avail nor did the banishment, in 1894, of Nana, a truculent chief of Lower Benin, induce the *oba* to mend his ways. In Jan. 1897 J. R. Phillips, acting consul-general, and eight Europeans were brutally massacred on the road from Gwato to Benin city, whilst on a mission to the king. Phillips had persisted in starting for Benin despite the repeated request of King Overami that he should delay his visit until he (the king) had finished the celebration of the annual "customs." A punitive expedition was organized under the command of Admiral Sir Harry Rawson. A force of 1,200 men was landed on the Benin river on Feb. 12. Five days later the city of Benin was occupied after considerable fighting. The town, which was found to be reeking of human sacrifices, was partly burned, and on the 22nd the expedition started on its return. Overami and chiefs responsible for the massacre were placed on their trial; the king was deported to Calabar, and the chiefs, six in all, were executed. A second punitive expedition in 1899 completed the pacification of the country. On this occasion the leader of the attack on the Phillips mission was captured and executed.

After the deposition of Overami the government was entrusted to a council of chiefs under the guidance of British officials. Human sacrifices were stopped and slavery abolished. Overami died in exile at Calabar in 1914 and, acceding to the wishes of the people, his son was recognized as *oba*. At the same time the country was made the Benin province of Southern Nigeria, a British Resident advising, but interfering as little as possible, with the native government. The system worked well and the substitution in 1916 of direct taxation for the former unlimited exactions of the chiefs was welcomed. Mr. Ormsby-Gore, under-secretary of state for the colonies, who visited Benin in 1926, congratulated the *oba* and his council on the marked contentment and prosperity of the country.

Roth, *Great Benin, its Customs, Art and Horrors* (Halifax, 1903), a comprehensive and profusely illustrated work, with an annotated bibliography. See also the reports on Nigeria issued annually by the Colonial Office, London. (F. R. C.)

BENITOITE, a mineral discovered in 1907 near the headwaters of the San Benito river, San Benito county, Calif., in veins with natrolite in glaucophane schist. It is a titanio-silicate of barium ($\text{BaTiSi}_2\text{O}_6$), crystallizing in the trigonal system, with a hardness of 6.5 and specific gravity 3.65. It may be colourless or blue, the colour varying sometimes in different parts, and passing to a deep sapphire blue. The blue variety is cut as a gem-stone, and often resembles blue spinel, though its softness distinguishes it from spinel and sapphire.

BENJAMIN, a tribe of Israel which traced its pedigree back to Jacob and Rachel (Gen. xxxv., the alternative name Ben-oni may have originated in a period of intertribal hostility such as that described in Jud. xix-xxi.). The tribe is thus regarded from the first as closely allied, though possibly subordinate, to the Joseph tribes. This view is borne out by the geographical position of Benjamin in the period that succeeded the Conquest, for its settlements lay to the south of Ephraim and Manasseh, immediately bordering on the territory of the Jebusites, which remained unsubdued by Israel till the time of David. The fact that after the death of Solomon it was traditionally a part of the southern kingdom is probably to be explained by its proximity to Jerusalem, and it is a striking fact that the chief sanctuary of the northern kingdom, Bethel, was originally included in the territories of this tribe. The rape of the maidens of Shiloh (Jud. xxi. 16 seq.) may point to the recognition of admixture with Canaanite blood.

The tribe is characterized as fierce and warlike (cf. Gen. xlix. 27, Jud. xix-xxi.), and was especially noted for the skill of its left-handed slingers (Jud. iii. 15, xx. 16, I Chron. xii. 2). It produced two of the great heroes of early Israel, Ehud (Jud. iii. 12-31) and Saul, and it is to the latter that we must ascribe the unification of Israel and the foundation of the monarchy. The later ascription of Jerusalem to this tribe added to a religious importance established by such centres of worship as Bethel, Gibeah, and Anathoth, while it is interesting to note that St. Paul himself claimed Benjamite descent. (T. H. R.)

BENJAMIN, JUDAH PHILIP (1811-1884), Anglo-American lawyer, of Jewish descent, was born a British subject at St. Thomas in the West Indies, on Aug. 11, 1811. After 1818 his parents lived in Charleston (S.C.). He went to Yale in 1825, but left there without taking a degree, and entered an attorney's office in New Orleans, being admitted to the bar in 1832. Together with John Slidell, he compiled a valuable digest of decisions of the superior courts of New Orleans and Louisiana. In 1848 he was admitted a councillor of the Supreme Court, and in 1852 he was elected a senator for Louisiana. He withdrew from the Senate in 1861 to join Jefferson Davis's provisional government as attorney-general, becoming afterwards his secretary of war (1861-1862), and chief secretary of State (1862-65). After the surrender at Appomattox he escaped from the coast of Florida, and after many vicissitudes reached England an exile.

The influence of English judges who knew his abilities and circumstances enabled him to be called to the bar on June 6, 1866. After working as pupil to C. E. Pollock, Benjamin joined the northern circuit, and a large proportion of his early practice came from solicitors at Liverpool who had correspondents in New Orleans. Having received a patent of precedence, he was, on Nov. 2, 1872, called within the bar as a queen's counsel. Benjamin had a power of marshalling facts and arguments that rendered him extremely effective, particularly before judges. He was less successful in addressing juries. He retired in 1882 to a house in Paris, and died there on May 6, 1884.

His *Treatise on the Law of Sale of Personal Property with References to the American Decisions and to the French Code and Civil Law*—a bulky volume known to practitioners as *Benjamin on Sales*—is the principal text-book on its subject. Many of his American speeches have been published.

See *Judah P. Benjamin*, by Pierce Butler (Philadelphia, 1907, with a good bibliography).

BENJAMIN OF TUDELA (in Navarre), a Jewish rabbi of the 12th century. He visited Constantinople, Egypt, Assyria and Persia, and penetrated to the frontiers of China, his journeys occupying about 13 years. His *Itinerary* is valuable for the Jewish history of the 12th century.

BIBLIOGRAPHY.—The *Itinerary* was translated from the Hebrew into Latin by Arias Montanus in 1575, and appeared in a French version by Baratier in 1734. There have been various English translations. One was published by Asher in 1840; another (with critical Hebrew text) by M. N. Adler (*Jewish Quarterly Review*, vols. xvi-xviii.; also reprinted as a separate volume, 1907).

BEN LEDI, a mountain of Perthshire, Scotland, 2,875 ft. high. (See PERTSHIRE.)

BENLLIURE Y GIL, JOSÉ (1855-). Spanish painter, born at Valencia, studied under Domingo, and was sent to the Spanish school in Rome. He was one of the select circle pensioned by the Spanish government for residence in Italy and executed several state orders for the decoration of public buildings; but he owes his chief fame to his large paintings, notably the "Vision in the Colosseum" and the "Valley of Jehosaphat and the Resurrection of the Dead." He became the leader of the Spanish art colony in Rome, where he also worked as a sculptor.

BEN LOMOND, a mountain in north-west Stirlingshire, Scotland, 3,192 ft. high (see LOCH LOMOND).

BENLOWES, EDWARD (1603?-76), English poet, son of Andrew Benlowes of Brent Hall, Essex, matriculated at St. John's College, Cambridge, in 1620, and on leaving the university made a prolonged tour on the continent of Europe. He was a Roman Catholic in middle life, but became a convert to Protestantism in his later years. He dissipated his fortune by openhanded generosity to his friends and relations, and possibly by serving in the Civil War; so that he was in great poverty at the time of his death in Oxford, Dec. 18 1676. The last eight years of his life were passed at Oxford.

Many of his writings are in Latin. His most important work is *Theophila, or Love's Sacrifice, a Divine Poem* (1652). The poem deals with mystical religion, telling how the soul, represented by Theophila, ascends by humility, zeal and contemplation, and triumphs over the sins of the senses. It is written in a curious stanza of three lines of unequal length rhyming together, and is full of the most far-fetched "conceits." Until his revival by Professor Saintsbury justice had hardly been done to Benlowes's poetical merits and indisputable piety. Samuel Butler, who satirized him in his "Character of a Small Poet," found abundant matter for ridicule in his eccentricities; and Pope placed him in the *Dunciad* as "Benlowes, propitious still to blockheads, bows."

His *Theophila* was reprinted by S. W. Singer; and in *Minor Poets of the Caroline Period*, vol. i. (1905). Mr. Saintsbury reprinted *Theophila* and two other poems by Benlowes, "The Summary of Wisdom," and "A Poetic Descant upon a Private Music-Meeting."

BEN MACDHUI: see INVERNESS-SHIRE.

BENNET, JOHN, English madrigalist, whose first known published work, *Madrigalls to Foure Voyces*, was printed in 1590 (the years of his birth and death are unknown). He contributed to Morley's *Triumphs of Oriana* (1601), five hymn tunes to *Barley's Psalter* between 1604 and 1614, and some of his compositions occur in Thomas Ravenscroft's *Briefe Discourse* (1614). In the preface to the *Briefe Discourse* Ravenscroft praises him as a "gentleman admirable for all kinds of composures." No later published works of his are extant, though there is an anthem by him in Thomas Myntell's ms. *Tristitia Remedum* (British museum), a collection dated 1616. The *Madrigalls to Foure Voyces*, "All creatures that are merry-minded," from the *Triumphs of Oriana* and two pieces from the *Briefe Discourse* have been printed by the English madrigal society. Ms. compositions exist in the collections of the British museum, Fitzwilliam museum and Peterhouse college, Cambridge, and Christ Church, Oxford.

BENNETT, CHARLES EDWIN (1858-1921), American classical scholar, was born April 6, 1858, in Providence (R.I.). He graduated from Brown university in 1878, and also studied at Harvard and in Germany. After teaching in secondary schools in Florida, New York, and Nebraska, he became professor of

Latin in the University of Wisconsin in 1889, of classical philology at Brown university in 1891, and of Latin at Cornell university in 1892. His syntactical studies are based on a statistical examination of Latin texts, and are marked by a fresh system of nomenclature. Of interest are his advocacy of "quantitative" reading of Latin verse, and his *Critique of Some Recent Subjunctive Theories* in *Cornell Studies in Classical Philology*, of which he was editor. Bennett's *Latin Grammar* (1895) was the first successful attempt in America to adopt the method of the brief, scholarly *Schulgrammatik*. Besides editing various Latin classics, he wrote, with G. P. Bristol, *The Teaching of Greek and Latin in Secondary Schools* (1900), and *The Latin Language* (1907), and with W. A. Hammond translated *The Characters of Theophrastus* (1902). His later publications include *Syntax of Early Latin* (1910-14); and *New Latin Composition* (1912). He died May 2, 1921, at Ithaca (N.Y.).

BENNETT, ENOCH ARNOLD (1867-), English novelist and dramatist, born at Hanley, Staffordshire on May 27, 1867. After leaving school he entered a lawyer's office, but in 1893, having published several stories and articles, decided to devote himself to writing and settled in London where he obtained the position of assistant-editor on the magazine, *Woman*. He succeeded to the editorship in 1896. It was not till after he was 30 years old that his first novel, *A Man From the North* (1898), was published. In 1900 he resigned his editorship, and since then he has been a prolific writer of fiction and miscellaneous literature. As book after book appeared under his name—books as various as *The Grand Babylon Hotel* (1902), *Anna of the Five Towns* (1904), *The Truth About An Author* (1903)—it was impossible to doubt that a fresh kind of whimsical impudent and realistic imagination was engaged in the task of providing us with literary entertainment. Here was a writer who made ordinary life seem extraordinary, who mingled the real and the fantastic, and who had humour, candour and knowledge of a hard world that to most readers was as foreign as fairyland. It was not yet certain, however, that Mr. Bennett would ever do justice to his talent. Many people regarded him merely as an exceptionally skilful writer for the market till at the age of 40 he published *The Old Wives' Tale* (1908) and took his place among the modern masters of fiction. Mr. Bennett proceeded to justify the praises he had won with *The Old Wives Tale* by writing a succession of remarkable novels and short stories, *Clayhanger* (1910), *The Card* (1911), *Hilda Lessways* (1911), and *The Matador of the Five Towns* (1912). This was the most exuberant period of his career, *Clayhanger* is a chapter of English social history, and in it and its sequels, *Hilda Lessways* and *These Twain* (1916), he has made the people of the Five Towns as real to the imagination as the people of Trollope's Barsetshire. Neither of the sequels is a book on the same level as *Clayhanger*, but the three novels form a trilogy which is one of the literary monuments of the age. And if *Clayhanger* is a masterpiece, *The Card*, a picaresque story of a successful man, is no less so. Meanwhile Mr. Bennett had written a number of plays, including *Milestones* (1912), in which he collaborated with Mr. Edward Knoblock. In 1913 his very successful play, *The Great Adventure* (founded on his novel, *Buried Alive*) was produced. During the next ten years Mr. Bennett continued to write novels, plays, literary criticism and (during the war with Germany) political articles without adding to his reputation. He was always pungent, always efficient, always interesting, but he seemed to be getting more and more remote from the life he knew best, and in *The Pretty Lady* (1918) he wrote of London follies with more cunning than inspiration. Then, in 1923, with *Riceyman Steps*, a study of miserliness, he added another novel to the list of his masterpieces. Here, once more, he expressed what a critic has called "his vision of the astounding bizarrerie of daily life." It is the sincerity of that vision which has made Mr. Bennett as individual an interpreter of the life of his own time or people as Mr. Kipling or Sir J. M. Barrie. He can invest even what is uninteresting with prodigious interest, and the lives of the dull become exciting in his hands. We find the same appetite for life in his volumes of commonsense philosophy and in his causeries on books as in his novels and short stories. He is eagerly intent on the

modern spectacle, and absorbs books, music, painting and ideas to a point at which less robust men would grow satiated. It is said that he misses the finer delicacies of prose but it is impossible to deny that he is an artist as well as a writer of genius. There is a buried poet—and Mr. Bennett has written and published verse—in a writer who can recreate as he has done the legend of the troubled lives of mortals and their pathetic and wonderful joys.

(R. Lb.)

BENNETT, JAMES GORDON (1795-1872), American journalist, founder and editor of the *New York Herald*, was born at Newmills, Banffshire, Scotland, in 1795. He was educated for the Roman Catholic priesthood in a seminary at Aberdeen, but in the spring of 1819 he emigrated to America. After earning a meagre living as teacher, proof-reader and translator in Halifax (Nova Scotia), Boston, New York and Charleston (S.C.), he returned to New York, where he projected a school, gave lectures on political economy and did subordinate work for the journals. During the next ten years he was employed on various papers, was the Washington correspondent of the *New York Enquirer* and associate editor of the *Courier and Enquirer*, his articles attracting much attention. He founded the short-lived *Globe* in New York in 1832; and in 1833-34 was the chief editor and one of the proprietors of the *Pennsylvanian* at Philadelphia. On May 6 1835, he published the first number of a small one-cent paper bearing the title of *New York Herald* and issuing from a cellar in which the proprietor and editor played also the part of salesman.

In his initial issue he outlined his policy: "We shall support no party—be the agent of no faction or *coterie*, and care nothing for any election, or any candidate from president down to constable"; and to this he consistently adhered. By his industry, and sagacity he made the paper a great commercial success. He devoted attention particularly to the gathering of news and was the first to introduce many of the methods of the modern American reporter. He published on June 13 1835, the first Wall Street financial article to appear in any American newspaper; printed a vivid and detailed account of the great fire of Dec. 1835, in New York; was the first, in 1846, to obtain the report in full by telegraph of a long political speech; during the Civil War maintained a large staff of war correspondents; and was a leader in the use of illustrations. Bennett continued to edit the *Herald* almost till his death on June 1 1872.

His son, JAMES GORDON BENNETT (1841-1918), born May 10 1841, and educated abroad and by private tutors, shared his father's burdens after 1866, and succeeded his father in the control of the *Herald*. He founded the *Evening Telegram*, established a daily edition of the *Herald* in London and later in Paris, sent Henry M. Stanley on his mission to find Livingstone in Central Africa, fitted out the "Jeannette" Polar Expedition, and in 1883 organized (with John W. Mackay) the Commercial Cable Company. On May 14 1918, he died in France, whence he had long directed the policies of the *New York Herald*. In his will he provided for the establishment of the James Gordon Bennett Memorial Home for New York journalists, in memory of his father.

See I. C. Pray's *Memoirs of James Gordon Bennett and His Times* (1855); also shorter accounts in James Parton's *Famous Americans of Recent Times* (1867); W. G. Bleyer's *Main Currents in the History of American Journalism* (1927) and O. G. Villard's *Some Newspapers and Newspaper Men* (1926). The best biography is D. C. Seitz, *The James Gordon Bennetts* (1928). Personal impressions are given by A. S. Crockett, *When James Gordon Bennett Was Caliph of Bagdad* (1926).

BENNETT, JOHN HUGHES (1812-1875), English physician and pathologist, was born in London on Aug. 31, 1812. He was educated at Exeter and the university of Edinburgh, and in 1837 graduated with the highest honours. During the next four years he studied in Paris and Germany, and on his return to Edinburgh in 1841 published a *Treatise on Cod-liver Oil as a Therapeutic Agent*. In the same year he began to lecture as an extra-academical teacher on histology, drawing attention to the importance of the microscope in the investigation of disease; and as physician to the Royal Dispensary he instituted courses of "polyclinical

medicine." From 1843 to 1874 he was professor of the institutes of medicine at Edinburgh. He died on Sept. 25, 1875, at Norwich after an operation for lithotomy.

His publications included *Lectures on Clinical Medicine* (1850-56), which in second and subsequent editions were called *Clinical Lectures on the Principles and Practice of Medicine*, and were translated into various languages, including Russian and Hindi; *Leucocythaemia* (1852), the first recorded cure of which was published by him in 1845; *Outlines of Physiology* (1858), reprinted from the 8th edition of the *Encyclopædia Britannica*; *Pathology and Treatment of Pulmonary Tuberculosis* (1853); *Textbook of Physiology* (1871-72).

BENNETT, SIR WILLIAM STERNDALE (1816-1875), English musical composer, the son of Robert Bennett, an organist, was born at Sheffield on April 13, 1816. He entered the choir of King's college chapel in 1824, and there studied the pianoforte under W. H. Holmes and Cipriani Potter, and composition under Lucas and Dr. Crotch at the Royal Academy. It was during this time that he wrote several of his most appreciated works, in which may be traced influences of the contemporary movement of music in Germany, which country he frequently visited during the years 1836-42. At one of the Rhenish musical festivals in Düsseldorf he made the acquaintance of Mendelssohn, and soon afterwards renewed it at Leipzig. Bennett was made musical professor at Cambridge in 1856, and was permanent conductor of the Philharmonic society from 1856 until 1866, when he became principal of the Royal Academy of Music. Among his best works may be mentioned his three sketches for pianoforte solo, *The Lake*, *The Millstream* and *The Fountain*, and his 3rd pianoforte concerto; for the orchestra, his symphony in G minor, and his overture *The Naiads*; and for voices, his cantata *The May Queen*, written for the Leeds Festival in 1858. For the jubilee of the Philharmonic society he wrote the overture *Paradise and the Peri* (1862); his sacred cantata *the Woman of Samaria* (first performed 1867) also achieved popularity, as did his *Maid of Orleans*, a sonata based on Schiller's tragedy which he produced shortly before his death. He received many honours, justly earned by his strenuous efforts to improve musical education in England, and was knighted in 1871. He died on Feb. 15, 1875.

See J. R. Sterndale Bennett, *The Life of William Sterndale Bennett*.

BEN NEVIS, highest mountain in the British Isles, Inverness-shire, Scotland. It is 4,406ft above sea level, 4½m. E.S.E. of Fort William, the meridian of 5° W. passing through it. From Banavie on the Caledonian canal, it shows two great masses, and though bulky is much less striking than many other Highland hills. Its summit is a plateau of 100ac. with a slight slope to the south and a sheer fall to the north-east of more than 1,500ft. Snow lies in some corries all the year round. The rocks of its lower half are mainly granite and gneiss, its upper half of porphyritic greenstone; a variety of minerals occur. Its circumference at the base is about 24m. It is flanked west and south by the glen and water of Nevis, on the east by the river and glen of Treig, and on the north by the river and glen of Spean. A bridle road up the mountain leaves Glen Nevis at Achintee; it has a gradient nowhere exceeding 1 in 5. It was made for the use of workers at the Meteorological observatory mentioned below: some of the bridges have fallen. A small hotel on the summit has long been closed and is in ruins, and the observatory maintained there from 1881 to 1905 was afterwards closed for lack of funds. Its observations showed mean temperatures of 23.4° in January and 41.7° in July at the summit, while at Fort William the figures were 38.7° and 57.1° respectively; the mean annual precipitation at the summit was 170.8in; at Fort William, 80in.

BENNIGSEN, LEVIN AUGUST, COUNT VON (1745-1826), Russian general, of Hanoverian family, was born Feb. 10, 1745, in Brunswick, and served in the Hanoverian Army until 1764. In 1773 he entered the Russian service as a field officer. He fought against the Turks in 1774 and in 1778, becoming lieutenant-colonel in the latter year. He distinguished himself repeatedly in the Polish War of 1793-94 and in the Persian War of 1796. The part played by Bennigsen in the actual assassination of the tsar Paul I. is not fully known, but he took a most active share in the formation and conduct of the conspiracy. Alexander I. made him

governor-general of Lithuania in 1801, and in 1802 a general of cavalry. In 1806 he was in command of one of the Russian armies operating against Napoleon, when he fought the battle of Pultusk and met the emperor in person in the sanguinary battle of Eylau (Feb. 8, 1807). Here he could claim to have inflicted the first reverse suffered by Napoleon, but six months later Bennigsen met with the crushing defeat of Friedland (June 14, 1807), the direct consequence of which was the Treaty of Tilsit. Bennigsen now retired for some years, but in the campaign of 1812 he fought at Borodino, and defeated Murat in the engagement of Tarutino, but on account of a quarrel with Marshal Kutusov he was compelled to retire. After the death of Kutusov he was recalled and placed at the head of an army. Bennigsen led one of the columns which made the decisive attack on the last day of the battle of Leipzig (Oct. 16-19, 1813). On the same evening he was made a count by the emperor Alexander I., and he afterwards commanded the forces which operated against Marshal Devout in North Germany. He retired from active service in 1818, and settled on his Hanoverian estate of Banteln near Hildesheim. Count Bennigsen died on Dec. 3, 1826. His son, ALEXANDER LEVIN, count von Bennigsen (1800-93), was a distinguished Hanoverian statesman.

BENNIGSEN, RUDOLF VON (1824-1902), German politician, was born at Lüneburg on July 10 1824, the son of an officer in the Hanoverian army. In 1855 he was elected a member of the second chamber and at once became the recognized leader of the Liberal opposition to the reactionary Government. He must be distinguished from Count Bennigsen, a member of the same family and son of the distinguished Russian general, who was also one of the parliamentary leaders at the time. Bennigsen was founder and president of the National Verein, a society which arose out of the public excitement created by the war between France and Austria, and had for its object the formation of a national party which should strive for the unity and the constitutional liberty of the whole Fatherland. It united the moderate Liberals throughout Germany and at once became a great political power, notwithstanding all the efforts of the Governments and especially of the king of Hanover to suppress it. In 1866 Bennigsen used all his influence to keep Hanover neutral in the conflict between Prussia and Austria, but in vain. In May of this year he had an important interview with Bismarck, who wished to secure his support for the reform of the confederation, and after the war was over at once accepted the position of a Prussian subject, and took his seat in the diet of the North German Confederation and in the Prussian parliament. He used his influence to procure as much autonomy as possible for the province of Hanover, but he was a strong opponent of the Guelph party. The National Verein, its work being done, was now dissolved, but Bennigsen was one of the founders of a new political party—the National Liberals—who, while they supported Bismarck's national policy, hoped to secure the constitutional development of the country. For the next 30 years he was president of the party. Many amendments suggested by him were introduced in the debates on the constitution; in 1870 he undertook a mission to South Germany to strengthen the national party there, and was consulted by Bismarck while at Versailles. It was he who brought about the compromise on the military bill in 1874. In 1877 he was offered the post of vice-chancellor with a seat in the Prussian ministry, but refused it because Bismarck or the king would not agree to his conditions. From this time his relations with the Government were less friendly, and in 1878 he brought about the rejection of the first Socialist bill. In 1883 he resigned his seat in parliament owing to the reactionary measures of the Government, which made it impossible for him to continue his former co-operation with Bismarck, but returned in 1887 to support the coalition of national parties. One of the first acts of the emperor William II. was to appoint him president of the province of Hanover. In 1897 he resigned this post and retired from public life. He died on Aug. 7 1902.

See H. Oncken, *Rudolf von Bennigsen* (1910); *Rudolf von Bennigsen Reden*, ed. W. Schultze and F. Thimme (Halle a.d.S., 1911, etc.).

BENNINGTON, a village in the south-west part of Vermont, U.S.A., 35m. N.E. of Albany, on the Rutland Railroad, and

at the intersection of main highways from three States; the county-seat of Bennington county. The population in 1920 was 7,230.

Bennington is picturesquely situated on the Walloomsac river, at the foot of the Green mountains. Nearby is Mt. Anthony (2,345ft.) which commands a wonderful view. There is an apple orchard of 3,500ac. 6m. from the village. The distinctive manu-

BY COURTESY OF THE BENNINGTON CHAMBER OF COMMERCE
THE COUNTRY-SIDE ABOUT BENNINGTON, VERMONT, WITH ONE OF FEW REMAINING WOODEN-COVERED BRIDGES IN THE FOREGROUND

factures are knit goods, woollen fabrics, paper, fine furniture, mirrors, brushes, waxed paper and "kiddie-kars," of which more than 500,000 are produced annually. The Vermont Soldiers home, Walloomsac inn (established in 1764), the oldest tavern in the State, and the Old First church (built in 1804-05) are points of historic interest. "Old Bennington," the part first settled, is a beautiful village, with many well-preserved colonial houses.

The town was surveyed in 1749, by the order of Governor Benning Wentworth of New Hampshire, after whom it was named, and was one of the "New Hampshire Grants" disputed by New York. The first log-cabin was built in 1761, the town was organized in 1782, and the village was incorporated in 1849. It was the home of Ethan Allen and Seth Warner, and the centre of the activities of the "Green Mountain Boys." During the Revolutionary War an important storehouse of the Continental Army was maintained here. Gen. Burgoyne, on his way to New York from Canada in 1777, sent two detachments of his army (chiefly Hessians and Indians) to seize the supplies. They were decisively defeated by Gen. John Stark in a battle fought on Aug. 16 on New York soil about 6m. W. of the village and this had an important influence on Burgoyne's campaign. The battle is commemorated by a monument 30ft. high. The flag raised at this battle is said to be the oldest "stars and stripes" in existence. In 1828-29 William Lloyd Garrison lived here, and published *The Journal of the Times*. The pottery industry, established by Captain John Norton in 1793, flourished for a century, and its products are much sought by collectors.

BENNO (1010-1106), bishop of Meissen, Germany, son of Werner, count of Woldenburg, was educated at Gosslar, and in 1066 was nominated by the emperor Henry IV. to the see of Meissen. In the troubles between empire and papacy that followed, Benno took part against the emperor. In 1085 he was deposed by the synod of Mainz, but after the death of Pope Gregory VII. he submitted, and on the recommendation of the imperialist Pope Clement III. was restored to his see, which he held till his death. His canonization (1523) drew from Luther a violent brochure "against the new false god and old devil, who is to be lifted up at Meissen."

For bibliography see Ulysse Chevalier, *Répertoire des sources hist., Bio-bibliographie*, s.v. "Benno."

BENOÎT, PETER LEONARD LEOPOLD (1834-1901), Flemish composer, was born on Aug. 17, 1834, at Harlebeke, Flanders. In 1851 he entered the Brussels conservatoire, where he studied under Fétis. During this period he composed music to many melodramas, and to an opera *Le Village dans les montagnes* for the Park theatre, of which in 1856 he became conductor. He

won a government prize and a money grant in 1857 by his cantata *Le Meurtre d'Abel*, and this enabled him to travel through Germany. In the course of his travels he wrote an essay *L'École de musique flamande et son avenir*. On his return he produced at Brussels his *Messe Solennelle*, which was praised by Fétis. In 1861 he visited Paris for the production of his opera *Le Roi des Aulnes* ("Erlkönig"), which, though accepted by the Théâtre Lyrique, was never mounted; while there he conducted at the Bouffes-Parisiens. Returning to Belgium he produced at Antwerp a sacred tetralogy, consisting of his *Cantate de Noël*, the above-mentioned *Mass*, a *Te Deum* and a *Requiem*, written in accordance with his own special theory. Later he gathered round him a small band of enthusiasts, who strove, but with little success, to form a national Flemish school whose music should differ completely from that of the French and German schools. Benoît's more important compositions include the Flemish oratorios *De Schelde* and *Lucifer*, the latter of which met with complete failure on its production in London in 1888; the operas *Het Dorp int Gebirge* and *Isa*, the *Drama Christi*; an enormous mass of songs, choruses, small cantatas and motets. He died at Antwerp, March 8, 1901.

See Stoffel's, *Peter Benoît* (1901).

BENOÎT DE SAINTE-MORE or **SAINTE-MAURE**, 12th century French troubadour, supposed author of the *Chronique des ducs de Normandie* and the *Roman de Troie*. It cannot, however, be regarded as certain that the Benoît of the *Chronique* is the same person as the Benoît who wrote the romance of Troy. Wace in his *Roman de Rou* brought down Norman history to the reign of Henry I., but here Henry II. seems to have withdrawn his patronage, and at the end of his poem Wace refers to a *maistre Benoeit* who had received a similar commission. There is no other contemporary poem extant dealing with the subject except the *Chronique des ducs de Normandie*, and Wace's rival has been commonly identified with Benoît de Sainte-More. The poem contains over 40,000 lines, and relates the history of the Norman dukes from Rollo to Henry I., with a preliminary sketch of the Danish invasions and the adventures of Hastings and his companions. Benoît drew his information from the *De moribus et actis primorum Normanniae ducum* of Dudon de Saint Quentin as far as 1002 and then followed the chronicle of William of Jumièges, also of Ordericus Vitalis and others. The *Chronique* probably dates from about 1172 to 1176. In the *Roman de Troie*, written about 1160, Benoît expressly asserts his authorship. He mentions "Omers" with great respect as *li clers merveilleux*, but his authority for the story is naturally not Homer but the apocryphal *Historia de excidio Trojae* of Dares the Phrygian, possibly in an amplified version now lost, and the *Ephemerides belli Trojani* of Dictys of Crete. The poem runs to about 30,000 lines. The personages of the classical story are converted into heroes of romance. They have their castles and their abbeys, and act in accordance with feudal custom. In the *Roman de Troie* first appeared the episode of Troilus and Briseida, that was to be developed later in the *Filistrato*, which in its turn formed the basis of Chaucer's *Troilus and Cressida*. The Shakespearian play of *Troilus and Cressida* is also indirectly derived from Benoît's story.

On the strength of a certain similarity of treatment Benoît has sometimes been credited with the authorship of the anonymous *Roman d'Énéas* and of the *Roman de Thèbes*, a romance derived indirectly from the *Thebais* of Statius. M. Constans is inclined to negative both these attributions.

The *Chronique des ducs de Normandie* was edited by Francisque Michel in 1836-44; the *Roman de Troie* by A. Joly in 1870-71 and by L. Constans (6 vols., 1904-12) the *Énéas*, by J. J. Salverda de Grave in H. Suchier's *Bibliotheca Normannica* in 1891; the *Roman de Thèbes* for the *Société des anciens textes français*, by M. L. Constans in 1890. See E. D. Grand in *La Grande Encyclopédie*; L. Constans in Petit de Julleville's *Hist. de la langue et de la litt. française* (vol. i., pp. 171-225), where the three romances are analysed at length. The prefaces to the editions just mentioned discuss the authorship of the romances.

BENSBERG, a large commune (Landgemeinde), in the Mülheim district of Rhenish Prussia, south of Bergisch Gladbach Pop. (1925) 12,612. It manufactures metals, leather and explosives.

BENSERADE, ISAAC DE (1613–1691), French poet, was born in Paris, and baptized on Nov. 5, 1613. He enjoyed the patronage of Richelieu, and then of Anne of Austria. He wrote some indifferent plays, but enjoyed a great reputation until the failure of his version (1676) of the *Metamorphoses* of Ovid. Benserade would probably be forgotten but for his sonnet on Job (1651). This sonnet, which he sent to a young lady with his paraphrase on Job, having been placed in competition with the *Urania* of Voiture, a dispute on their relative merits long divided the whole court and the wits into two parties, styled respectively the *Jobelins* and the *Uranists*. The partisans of Benserade were headed by the prince de Conti and Mlle. de Scudéry, while Mme. de Montausier and J. G. de Balzac took the side of Voiture.

Some years before his death Oct. 19, 1691, Benserade retired to Chantilly, and devoted himself to a translation of the Psalms, which he nearly completed.

BENSLEY, ROBERT (d. c. 1809), English actor praised by Charles Lamb in the *Essays of Elia*, played important parts at the Drury Lane, Covent Garden, and Haymarket theatres from 1765 to 1796. His most successful rôle was Malvolio.

BENSON, EDWARD WHITE (1829–1896), archbishop of Canterbury, was born on July 14, 1829, at Birmingham, the son of a manufacturing chemist, who came of a family of Yorkshire dalesmen. He was educated at King Edward VI.'s school, Birmingham, and Trinity college, Cambridge, graduated in 1852 as a senior optime, 8th classic and senior chancellor's medallist, and became a fellow of his college. He was ordained deacon in 1854 and priest in 1856. He was assistant master at Rugby, for the latter part of the time under Frederick Temple, who became his life-long friend, and then (1859–68) headmaster of the newly founded Wellington College. He had married in 1850 his cousin, Mary Sidgwick. He became prebendary of Lincoln and examining chaplain to the bishop in 1868, and in 1872 chancellor of the diocese. Early in 1877 he was appointed to the new see of Truro. The new bishop put fresh life into the organization of the church in Cornwall, and during his tenure of office Truro Cathedral was built and (1887) consecrated. On the death of Dr. Tait, Benson was nominated to the see of Canterbury, and enthroned on March 29, 1883.

Frequent communications passed between him and the heads of the Eastern churches. With their approval a bishop was again consecrated, after six years' interval (1881–87), for the Anglican congregations in Jerusalem and the East; and the features which had made the plan objectionable to many English churchmen were now abolished. In 1886, after much careful investigation, he founded the "Archbishop's Mission to the Assyrian Christians," having for its object the instruction and the strengthening from within of the "Nestorian" churches. An interchange of courtesies with the Metropolitan of Kiev on the occasion of the 900th anniversary of the conversion of Russia (1888), led to a friendlier feeling between the English and Russian churches, but with the efforts towards a *rapprochement* with the Church of Rome the archbishop would have nothing to do.

With the other churches of the Anglican Communion the archbishop's relations were cordial in the extreme. He sat on the ecclesiastical courts commission (1881–83) and the sweating commission (1888–90). He brought bills into parliament to reform church patronage and church discipline. The latter became law in 1892, and the former was merged in the Benefices bills, which passed in 1898, after his death. He wrote and spoke against Welsh disestablishment (1893); and under his guidance, the existing agencies for church defence were consolidated. He helped to establish the House of Laymen in the province of Canterbury (1886). The most important ecclesiastical event of his primacy was the judgment in the case of the bishop of Lincoln (see LINCOLN JUDGMENT). In 1896 the archbishop went to Ireland. He was received with enthusiasm, but the tour fatigued him. On Sunday morning Oct. 11, just after his return, he was on a visit to Mr. Gladstone, when he died in Hawarden parish church, suddenly, from heart failure.

Archbishop Benson left numerous writings, including an essay on "The Cathedral" (1878), and charges, sermons and addresses.

But his two chief works, posthumously published, are his *Cyprian* (1897), which had occupied him at intervals since early manhood; and *The Apocalypse, an Introductory Study* (1900), interesting and beautiful, but limited by the fact that the method of study is that of a Greek play, not of a Hebrew apocalypse. The archbishop's knowledge of the past was both wide and minute, but it was that of an antiquary rather than of a historian. "I think," writes his son, "he was more interested in modern movements for their resemblance to ancient than vice versa." He wrote some hymns, including "O Throned, O Crowned," and a beautiful version of *Urbs Beata*. His "grandeur in social function" was unequalled and his interests were very wide. But above all else he was a great ecclesiastic. He paid less attention to secular politics than Archbishop Tait; but if a man is to be judged by the effect of his work, it is Benson and not Tait who should be described as a great statesman. His biography, by his son, reveals him as a man of devout and holy life, impulsive indeed and masterful, but one who learned self-restraint by strenuous endeavour.

See A. C. Benson, *Life of Archbishop Benson* (1899); J. H. Bernard, *Archbishop Benson in Ireland*, 1897; Sir L. T. Dibden, in the *Quarterly Review*, Oct. 1897.

His eldest son, ARTHUR CHRISTOPHER BENSON (1862–1925), was educated at Eton and King's College, Cambridge. He was a master at Eton College from 1885 to 1903. His literary capacity was early shown in the remarkable fiction of his *Memoirs of Arthur Hamilton* (1886) under the pseudonym of "Christopher Carr," and his *Poems* (1893) and *Lyrics* (1895) established his reputation as a writer of verse. Among his works are *Fasti Etonenses* (1899); his father's *Life* (1899); *The Schoolmaster* (1902), a commentary on the aims and methods of an assistant schoolmaster in a public school; a study of Archbishop Laud (1887); monographs on D. G. Rossetti (1904), Edward Fitzgerald (1905) and Walter Pater (1906), in the "English Men of Letters" series; *Lord Vyet and other Poems* (1897), *Peace and other Poems* (1905), *The Upton Letters* (1905), *From a College Window* (1906), *Beside Still Waters* (1907). He collaborated with Lord Esher in editing the *Correspondence of Queen Victoria* (1907). Benson wrote the words of the anthem "Land of Hope and Glory." Some of these writings, and above all, *From a College Window*, have had an extraordinary vogue in the United States. He wrote in all some 50 books. He went to reside in Cambridge in 1904. He was elected a fellow of Magdalene College, and in 1915 became its master. He entertained lavishly, and did the honours of the college with grace and dignity. He died June 17, 1925. He never married. He left a large fortune mainly the result of his literary work. He bequeathed £2,000 to his college "as an hospitality fund."

See *Selections from his Diary*, edited by Percy Lubbock (1926).

The third son, EDWARD FREDERICK BENSON (b 1867), was educated at Marlborough College and King's College, Cambridge. He worked at Athens for the British Archaeological Society from 1892 to 1895, and subsequently in Egypt for the Hellenic Society. In 1893 his society novel, *Dodo*, brought him to the front among the writers of clever fiction; and this was followed by other novels, notably *The Vintage* (1898) and *The Capsina* (1899), the subjects of which were drawn from modern Greece. Among his later works may be mentioned *The Challoners* (1904), *David of King's* (1924) and *Mezzanine* (1926).

The fourth son, ROBERT HUGH BENSON (1871–1914), was educated at Eton and at Trinity College, Cambridge. After reading with Dean Vaughan at Llandaff he took orders, and in 1898 became a member of the Community of the Resurrection at Mirfield. In 1903 he became a Roman Catholic, was ordained priest at Rome in the following year, and returned to Cambridge as assistant priest of the Roman Catholic church there. He achieved remarkable success as a preacher, also as a novelist, his best novels being historical romances intended to serve also as Catholic propaganda. A small volume of poems (Dec. 1914) was published after his death. He became a Papal Chamberlain in 1911. He died on Oct. 19, 1914, after a short illness at Salford, where he was conducting a mission.

Among his numerous publications are *The Light Invisible*, *By What*

Authority? The King's Achievement, Richard Raynal, Solitary, The Queen's Tragedy, The Sentimentalists, Lords of the World. See his *Life* by C. C. Martindale, S.J., and *Hugh* by A. C. Benson.

BENSON, SIR FRANCIS ROBERT (1858—), English actor, son of William Benson of Alresford, Hants, was born on Nov. 4, 1858. While at New college he produced the first Oxford Greek play, the *Agamemnon*. He made his first professional appearance at the Lyceum, under Irving, in *Romeo and Juliet*, as Paris, in 1882. In the next year he went into managership with a company of his own, taken over from Walter Bentley. In 1886 he married Gertrude Constance Featherstonhaugh, who acted in his company and continued to play leading parts with him. Besides appearing in London he has toured regularly in Shakespeare, and has been to Canada (1913) and South Africa (1921). His finest parts were Hamlet, Coriolanus, Richard II., Lear, and Petruchio. By his organization of a regular touring company, and by his foundation of a dramatic school of acting in 1901, Benson exercised a most important influence on the contemporary stage. From the first he devoted himself largely to the production of Shakespeare's plays. Since 1888 he has organized 26 of the annual Stratford-on-Avon Shakespearean Festivals. He was knighted in 1916.

BENSON, FRANK WESTON (1862—), American painter, was born in Salem (Mass.), March 24, 1862. He was a pupil of Boulanger and of Lefebvre in Paris; won a silver medal at the Paris exhibition (1900); the Potter Palmer medal and prize, Chicago (1910); Logan prize, Chicago society of etchers (1918); William A. Clark prize and Corcoran gold medal (1919), and became a member of the "Ten Americans," and of the national academy of design, New York. In addition to his reputation as a painter, he achieved success with his etchings and wash drawings of wild fowl, a field in which his talent is especially spontaneous and happy. He was one of the decorators of the Congressional library, Washington (D.C.).

BENSON, GEORGE (1699–1762), English dissenting minister, was born at Great Salkeld, in Cumberland. His most important works are: *History of the First Planting of the Christian Religion* (1738); *Reasonableness of the Christian Religion* (1743); the *History of the Life of Jesus Christ*, posthumously published in 1764.

BENSON, WILLIAM SHEPHERD (1855—), American naval officer, was born at Macon, Ga., on Sept. 25, 1855. He graduated from the U.S. Naval academy in 1877; became captain in 1909, and rear admiral in 1915. He had been commandant of the Philadelphia Navy Yard for two years when, in 1915, he was appointed chief of naval operations. He was a member of the commission appointed to confer with the Allied Powers in 1917, and was appointed naval representative for preparing the terms of the Armistice (1918) and naval adviser to the American peace commission. He was retired automatically in 1919, with the rank of rear-admiral. In 1920 he was appointed chairman of the U.S. shipping board and made admiral for life.

BENT, JAMES THEODORE (1852–1897), English traveller, was the son of James Bent of Baildon house, near Leeds, Yorkshire, where he was born on March 30, 1852. He was educated at Repton school and Wadham college, Oxford, where he graduated in 1875. He spent considerable time in the Aegean archipelago, of which he wrote in *The Cyclades; or Life among the Insular Greeks* (1885). The years 1885–88 were given up to archaeological investigations in Asia Minor, his discoveries being communicated to the *Journal of Hellenic Studies* and other publications. In 1889 he undertook excavations in the Bahrein islands of the Persian gulf, and found evidence that they had been a primitive home of the Phoenician race. After an expedition in 1890 to Cilicia Trachea Bent spent a year in South Africa. He made the first detailed examination of the remarkable ruins at Great Zimbabwe. Bent described his work in *The Ruined Cities of Mashonaland* (1892). In 1893 he investigated the ruins of Axum and other places in the north of Abyssinia, partially made known before by the researches of Henry Salt and others, and *The Sacred City of the Ethiopians* (1893) gave an account of this expedition. Bent now visited at considerable risk the almost

unknown Hadramut country (1893–94), and during this and later journeys in southern Arabia he studied the ancient history of the country, its physical features and actual condition. On the Dhafar coast in 1894–95 he visited ruins which he identified with the Abyssapolis of the frankincense merchants. In 1895–96 he examined part of the African coast of the Red sea, finding there the ruins of a very ancient gold-mine and traces of what he considered Sabeian influence. While on another journey in south Arabia (1896–97), Bent was seized with malarial fever, and died in London on May 5, 1897, a few days after his return. Mrs. Bent, who had contributed by her skill as a photographer and in other ways to the success of her husband's journeys, published in 1900 *Southern Arabia, Soudan and Sakotra*, in which were given the results of their last expedition into that region. The conclusions at which Bent arrived as to the Semitic origin of the ruins in Mashonaland have not been accepted by archaeologists, but the value of his pioneer work is undeniable (see ZIMBABWE).

BENTHAM, GEORGE (1800–1884), English botanist, was born at Stoke near Portsmouth on Sept. 22, 1800. His father, Sir Samuel Bentham (1757–1831), the only brother of Jeremy Bentham, was a naval architect in the service of the empress Catherine II. of Russia. The Bentham family spent much time on the Continent, and after 1815 settled at Montpellier. There George read A. P. de Candolle's *Flore française* and was much impressed with its analytical tables. He began forthwith to collect the materials for his first botanical work, *Catalogue des plantes indigènes des Pyrénées et du Bas Languedoc* (1826). From 1826–32 he acted as secretary to his uncle, Jeremy Bentham, and studied for the bar at Lincoln's Inn. But the inheritance of his father's and his uncle's fortunes made him independent, and enabled him to spend his time in his herbarium and his library.

In 1854 he found the maintenance of a herbarium and library too great a tax on his means. He therefore offered them to the Government on the understanding that they should form the foundation of such necessary aids to research in the Royal Botanic Gardens at Kew. In 1858 his *Handbook of the British Flora* was published, and has been reprinted several times, the last edition appearing in 1924. The Government, in 1857, sanctioned a scheme for the preparation of a series of Flora of British colonies and possessions. Bentham began with the *Flora Hongkongensis* in 1861. This was followed by the *Flora Australiensis*, in seven volumes (1863–78). His greatest work was the *Genera Plantarum*, begun in 1862 and concluded in 1883 in collaboration with Sir Joseph Hooker. He seemed at last only to live for the completion of this monumental work. He died on Sept. 10, 1884.

During the period 1826–32, he wrote the *Outline of a New System of Logic, with a Critical Examination of Dr. Whateley's Elements of Logic* (1827) and a number of articles on various legal subjects. In his *Outline* the principle of the qualification of the predicate was explicitly stated for the first time.

See B. D. Jackson, *Life of George Bentham* (English Men of Science Series, 1906).

BENTHAM, JEREMY (1748–1832), English philosopher and jurist, was born on Feb. 15, 1748, in Red Lion street, Houndsditch, London, the son of an attorney. His father afterwards retired to a country house near Reading, where young Jeremy spent many happy days. At the age of three the child is said to have read eagerly such works as Rapin's *History* and to have begun the study of Latin. While at Westminster school he obtained a reputation for Greek and Latin verse writing, and he was only 13 when he matriculated at Queen's college, Oxford, where his most important acquisition seems to have been a thorough acquaintance with Sanderson's *Logic*. He took his degree in 1763, and in the same year entered Lincoln's Inn, and took his seat as a student in the Queen's Bench, where he listened with rapture to the judgments of Lord Mansfield. He managed also to hear Blackstone's lectures at Oxford, but says that he immediately detected the fallacies which underlay the rounded periods of the future judge. He spent his time in making chemical experiments and in speculating upon legal abuses rather than in reading Coke upon Littleton and the Reports. On being called to the bar he "found a cause or two at nurse for him, which

he did his best to put to death," to the bitter disappointment of his father, who had confidently looked forward to seeing him upon the Woolstack.

The first fruits of Bentham's studies, the *Fragment on Government*, appeared in 1776. The subtitle, "an examination of what is delivered on the subject of government in the Introduction to William Blackstone's Commentaries," indicates the nature of the work. Bentham found the "grand and fundamental" fault of the *Commentaries* to be Blackstone's "antipathy to reform." This book, written in a clear and concise style very different from that of Bentham's later works, may be said to mark the beginning of philosophic radicalism. This attack upon Blackstone's praises of the English Constitution was variously attributed to Lord Mansfield, Lord Camden and Lord Ashburton. Lord Shelburne (afterwards first marquess of Lansdowne) read the book, and called upon its author in 1781 in his chambers at Lincoln's Inn. Henceforth Bentham was a frequent guest at Bowood, where he met Miss Caroline Fox (daughter of the second Lord Holland), to whom he afterwards made a proposal of marriage. At this period Bentham's mind was much occupied with his *Rationale of Punishments and Rewards*, which was published in French by Etienne Dumont in 1811, but only appeared in English in 1825. In 1785 Bentham started, by way of Italy and Constantinople, on a visit to his brother, Samuel Bentham, a naval engineer, holding the rank of colonel in the Russian service; and it was in Russia that he wrote his *Defence of Usury* (pr. 1787). This, his first essay in economic science, cast in the form of a series of letters from Russia, shows him as a disciple of Adam Smith, but one who insisted on the extreme logical application of Smith's principles. He argued that every man was the best judge of his own interest, that it was desirable from the public point of view that he should seek it without hindrance, and that there was no reason for limiting the application of this doctrine in the matter of lending money at interest. His later works on political economy followed the *laissez-faire* principle, though with modifications. In the *Manual of Political Economy*, first partially printed by Dumont in the *Bibliothèque britannique* (Geneva 1798) he gives a list of the *agenda* and *non-agenda* for the State, the former being a very short and the latter an extended list. The book is a re-statement of Adam Smith's point of view from the philosophical and political standpoint.

Disappointed after his return to England in 1788 in the hope which he had entertained of making a career in political life, he settled down to discovering the principles of legislation. The great work, upon which he had been engaged for many years, the *Introduction to Principles of Morals and Legislation*, was published in 1789. In this book he defines the principle of utility, as "that property in any object whereby it tends to produce pleasure, good or happiness, or to prevent the happening of mischief, pain, evil or unhappiness to the party whose interest is considered." Mankind, he said, was governed by two sovereign motives—pain and pleasure, and the principle of utility recognized this subjection. The object of all legislation must be the "greatest happiness of the greatest number" (the phrase appears to have originated with Beccaria) and Bentham's insistence on this is not successfully reconciled with his individualist principle of utility; he did in fact advocate certain economic measures on succession and taxation which were in conflict with individualism. On the legal side he deduced from the principle of utility that since all punishment is itself evil it ought only to be admitted "so far as it promises to exclude some greater evil."

The fame of the *Principles* spread widely and rapidly. Bentham was made a French citizen in 1792; and his advice was respectfully received in most of the States of Europe and America, with many of the leading men of which he maintained an active correspondence; one of the most curious of these exchanges is with Mehemet Ali. In 1817 he became a bencher of Lincoln's Inn. His ambition was to be allowed to prepare a code of laws for his own or some foreign country. The codification of law was one of his chief preoccupations, but he seems to have underestimated its difficulties and to have overlooked the necessity of diversity of institutions adapted to the tradition and civilization of different

countries. In his conception of the treatment of criminals Bentham was far in advance of his age, and must be reckoned among the pioneers of prison reform. It is true that the particular scheme he worked out was bizarre, and spoiled by the elaborate detail which Bentham loved. Under his scheme he believed "morals would be reformed, health preserved, industry invigorated, instruction diffused. . . ." During nearly a quarter of a century he was engaged in negotiations with the Government for the erection of a "Panopticon," for the central inspection of convicts: these were eventually abandoned, and Bentham received in 1813, in pursuance of an act of parliament, £23,000 by way of compensation. In 1797-98 he studied the poor law question, and put forward suggestions which were not dissimilar from those actually adopted in 1834. It was at a later period of his life that he propounded schemes for cutting canals through the isthmus of Suez and the isthmus of Panama.

In 1823 he established the *Westminster Review*, to spread the principles of philosophic radicalism. Bentham had been brought up a Tory, but he had changed his political ideas and had come to believe that his ideal of general happiness could only be accomplished under democratic institutions. As far back as 1809 he had written a tract, *A Catechism of Parliamentary Reform*, which advocated annual elections, equal electoral districts, a wide suffrage and the secret ballot, but it was not published till 1817. He drafted a series of resolutions on reform based on this tract which were moved in the House of Commons in 1818. Bentham died in Queen's Square place on June 6, 1832, in his 85th year. In accordance with his directions, his body was dissected in the presence of his friends, and the skeleton is still preserved in University college, London. At the time of his death he was working on his Constitutional Code, the first volume of which had appeared in 1827.

Bentham's life was a happy one for its kind. He gathered around him a group of congenial friends and pupils, such as the Mills, the Austins and Bowring, with whom he could discuss the problems upon which he was engaged, and by whom several of his books were practically rewritten from the mass of rough though orderly memoranda which the master had himself prepared. Thus, for instance, the *Rationale of Judicial Evidence* was written out by J. S. Mill, and the *Book of Fallacies* by Bingham. The services which Etienne Dumont rendered in recasting as well as translating the works of Bentham were still more important. It is often difficult to distinguish what part of the work is Bentham's and what is due to his assistants.

A graphic account is given by the American minister, Richard Rush (in *Residence at the Court of London*), of an evening spent at his London house in the summer of the year 1818. "If Mr. Bentham's character is peculiar," he says, "so is his place of residence. It was a kind of blind alley, the end of which widened into a small, neat courtyard. There by itself stands Mr. Bentham's house. Shrubbery graced its area and flowers its window-sills. It was like an oasis in the desert. Its name is the Hermitage. Mr. Bentham received me with the simplicity of a philosopher. I should have taken him for seventy or upwards. . . . The company was small but choice—Mr. Brougham, Sir Samuel Romilly, Mr. Mill, author of a well-known work on India, M. Dumont, the learned Genevan, once the associate of Mirabeau, were all who sat down to table."

Whether or not he can be said to have founded a school, many of Bentham's doctrines have become so far part of the common thought of the time that there is hardly an educated man who does not accept as too clear for argument some truths which were invisible till Bentham pointed them out. His sensitively honourable nature was shocked by the enormous abuses which confronted him on commencing the study of the law. He rebelled at hearing the system under which they flourished described as the perfection of human reason. But he was no merely destructive critic. He was determined to find a solid foundation for both morality and law, and to raise upon it an edifice, no stone of which should be laid except in accordance with the deductions of the severest logic. Most of Bentham's conclusions result from the application of a rigorous common sense to the

facts of society. J. S. Mill said of his work: "There is hardly anything in Bentham's philosophy which is not true. The bad part of his writings is his resolute denial of all that he does not see; of all truths but those which he recognizes."

As a jurist he inquires of all institutions whether their utility justifies their existence. If not, he is prepared to suggest a new form of institution by which the needful service may be rendered. English institutions had never before been so comprehensively and dispassionately surveyed. His writings have been and remain a storehouse of instruction for statesmen, an armoury for legal reformers. "Pillé par tout le monde," as Talleyrand said of him, "il est toujours riche." To trace the results of his teaching in England alone would be to write a history of the legislation of half a century. Upon the whole administrative machinery of government, upon criminal law and upon procedure, both criminal and civil, his influence has been most salutary; and the great legal revolution which in 1873 purported to accomplish the fusion of law and equity is not obscurely traceable to the same source. Those of Bentham's suggestions which have hitherto been carried out have affected the matter or contents of the law. The hopes which have been from time to time entertained, that his suggestions for the improvement of its form and expression were about to receive the attention which they deserved, have hitherto been disappointed.

BIBLIOGRAPHY—Bentham's *Works*, together with an Introduction by J. Hill Burton, selections from his correspondence and a biography, were published by Dr. Bowring, in eleven closely printed volumes (1838-1843). This edition does not include the *Deontology*, which, much rewritten, had been published by Bowring in 1834. Translations of the *Works* or of separate treatises have appeared in most European languages. Large masses of Bentham's mss., mostly unpublished, are preserved at University college, London (see T. Whittaker's *Report*, 1892, on these mss., as newly catalogued and reclassified by him in 155 parcels), also in the British Museum (see E. Nys, *Études de droit international et de droit politique*, 1901, pp. 291-333). See farther on the life and writings of Bentham: L. Stephen, *The English Utilitarians* (1900), vol. I., C. M. Atkinson, *Jeremy Bentham* (1905); A. C. Doyle, *Jeremy Bentham, Selected Bibliography* (1899); O. Kraus, *Zur theorie des Werkes* (Berlin, 1901); C. M. Atkinson, *Jeremy Bentham* (1905); J. McCunn, *Six Radical Thinkers* (1910); W. R. Sorley, *Bentham and the Early Utilitarians* (1914); H. G. Lundin, "Influence of J. Bentham on English Democratic Development" (University of Iowa Studies, vol. vii., 1920); Graham Wallas, *Jeremy Bentham* (1922); C. Philipson, *Three Criminal Law Reformers* (1923).

BENTHAMISM means the views, especially the ethical views, of Jeremy Bentham (*q.v.*). It is sometimes used as synonymous with Utilitarianism (*q.v.*). (See also ETHICS, HISTORY OF.)

BENTHOS, the name used to denote collectively the sedentary bottom-living animal and plant life of the sea, in contradistinction to the drifting plankton (*q.v.*) and actively-swimming nekton (*q.v.*). See MARINE BIOLOGY.

BENTINCK, LORD WILLIAM (1774-1839), governor-general of India, second son of the 3rd duke of Portland, was born on Sept. 14, 1774. He entered the army, rose to the rank of lieutenant-colonel and was present at Marengo. In 1803 he was nominated governor of Madras, where he quarrelled with the chief justice, Sir Henry Gwillim, and several members of his council. The sepoy mutiny at Vellore in 1807 led to his recall. His name was considered at this time for the post of governor-general, but Lord Minto was selected instead. and it was not until twenty years later that he succeeded Lord Amherst in that office. His governor-generalship (1827-35) was notable for many reforms, chief among which were the suppression of the Thugs (*q.v.*), the abolition of suttee, and the making of the English language the basis of education in India. Lord William's administration was essentially peaceful, but progressive and successful. He died in Paris on June 17, 1839.

See Demetrius C. Boulger, *Lord William Bentinck*, in the "Rulers of India" series (1892).

BENTINCK, LORD WILLIAM GEORGE FREDERICK CAVENDISH, better known as LORD GEORGE BENTINCK (1802-1848), British politician, was the second surviving son of the fourth duke of Portland, by Henrietta, sister of Viscountess Canning, and was born on Feb. 27 1802. He served in the army for some years, and entered parliament in 1828 for King's Lynn,

which he represented for 20 years. Till within three years of his death he was little known out of the sporting world.

He belonged originally to the moderate Whig party, and voted in favour of Catholic emancipation, as also for the Reform bill, though he opposed some of its principal details. Soon after, however, he joined the ranks of the Opposition, with whom he sided up to 1846. When, in that year, Sir Robert Peel openly declared in favour of free trade, the advocates of the corn-laws, then without a leader, discovered that Lord George Bentinck was the only man of position and family around whom the several sections of the Opposition could be brought to rally. He soon gave convincing evidence of powers so formidable that the Protectionist party under his leadership was at once stiffened into real importance. Towards Peel, in particular, his hostility was uncompromising. Believing, as he himself expressed it, that that statesman and his colleagues had "hounded to the death his illustrious relative" Canning, he combined with his political opposition a degree of personal animosity that gave additional force to his invective.

He abandoned his connection with the turf, disposed of his magnificent stud and devoted his whole energies to the laborious duties of a parliamentary leader. Apart from the question of the corn-laws, however, his politics were decidedly independent. In opposition to the rest of his party, he supported the bill for removing the Jewish disabilities, and was favourable to the scheme for the payment of the Roman Catholic clergy in Ireland by the landowners. The result was that on Dec. 23 1847 he wrote a letter resigning the Protectionist leadership, though he still remained active in politics.

But his positive abilities as a constructive statesman were not to be tested, for he died suddenly at Welbeck Sept. 21 1848. It was to be left to Disraeli to bring the Conservative Party into power, with Protection outside its programme.

See B. Disraeli (Lord Beaconsfield), *Lord George Bentinck: a Political Biography* (1851).

BENTIVOGLIO, GIOVANNI (1443-1508), tyrant of Bologna, was born after the murder of his father, the chief magistrate of the commune. In 1462 Giovanni made himself master of the city, although it was nominally a fief of the Church under a papal legate. He ruled with a stern sway for nearly half a century, but the brilliance of his court, his encouragement of the fine arts and his decoration of the city with sumptuous edifices to some extent compensated the Bolognese for the loss of their liberty. Cesare Borgia (*q.v.*) contemplated the subjugation of Bologna in 1500, when he was crushing the various despots of Romagna, but Bentivoglio was saved by French intervention. In 1502 he took part in the conspiracy against Cesare, but, when the latter obtained French assistance, he abandoned his fellow-conspirators and helped Borgia to overcome them. During the brief pontificate of Pius III., who succeeded Alexander VI. in 1503, Bentivoglio enjoyed a respite, but the new pope, Julius II., was determined to reduce all the former papal states to obedience. Having won Louis XII. of France to his side, he led an army against Bologna, excommunicated Bentivoglio and forced him to abandon the city (Nov. 1506). The deposed tyrant took refuge with the French, whom he trusted more than the pope, and died at Milan in 1508.

BENTIVOGLIO, GUIDO (1570-1644), Italian cardinal, statesman and historian, was born at Ferrara in 1579. He was private chamberlain to Clement VIII.; and Paul V. created him archbishop of Rhodes (1607), and nuncio first to Flanders and then to France. He was created cardinal in 1621. A close friend of Pope Urban VIII., he was marked out as Urban's successor, but on Sept. 7 1644, he died suddenly at the opening of the conclave. Bentivoglio's principal works are: *Della Guerra di Flandria* (best edition, Cologne, 1633-39), translated into English by Henry, earl of Monmouth (London, 1654); *Lettere diplomatiche di Guido Bentivoglio* (Brussels, 1631, frequently reprinted, best edition by L. Scarabelli, 2 vols., Turin, 1852). The complete edition of his works was published at Venice in 1668 in quarto.

BENTLEY, JOHN FRANCIS (1839–1902), English architect, was born at Doncaster, Jan. 30, 1839, and died at Clapham, London, March 2, 1902. He began as an engineer, passing after a short time into a builder's office and then went as pupil to Henry Clutton, an architect whose practice was largely ecclesiastical and influenced by the French Gothic school. Bentley refused the partnership offered by Clutton and went into practice on his own account in 1862. His earliest important undertaking was the enlargement and decorative treatment of St. Francis church, Notting Hill, London, followed by other ecclesiastical work in London and the country, in which he showed an increasing tendency towards a more English form of Gothic design. The seminary of St. Thomas, at Hammersmith, London (now the Sacred Heart convent), is noteworthy for the beauty of its treatment and carefully conceived plan, and was followed by St. John's school at Beaumont, one of the best examples of his work based on English Renaissance of the 17th century. Holy Rood church, at Watford, built in 1892, is an excellent example of Bentley's skill in adapting mediaeval ideals to the circumstances of our times.

In his 56th year Bentley was appointed by Cardinal Vaughan as the architect of the proposed Roman Catholic cathedral in Westminster, London. The Byzantine style was chosen, Bentley equipped himself for dealing with the problem by studying his subject in Italy and Constantinople, and spent several months in Rome and northern Italy in 1894. From a series of sketch plans, prepared on his return, was evolved that for the cathedral as now built. In the beginning it was intended that the whole of the inside surface should be clothed with marble and mosaic. There was, however, much difficulty in arriving at a comprehensive pictorial scheme for the treatment of the vast building. Bentley himself prepared a very thoughtful and complete proposal, of which only a small part is embodied in the mosaics already executed.

In May, 1898, he visited the United States to prepare plans for the proposed cathedral at Brooklyn; the designs, in which he reverted to Gothic, were left incomplete at his death, which took place on the eve of his being presented with the gold medal of the Royal Institute of British Architects. Besides his architectural works, Bentley's talent in designing for the subsidiary arts found scope in numerous commissions for stained glass, furniture, metal work, embroidery and the like.

See W. de l'Hôpital, *Westminster Cathedral and its Architect* (1920); T. J. Willson, "Memoir" *Journal of Royal Institute of British Architects* (III Series, vol. ix).

BENTLEY, RICHARD (1662–1742), English scholar and critic, was born at Oulton near Wakefield, Yorkshire, and educated at St. John's college, Cambridge. In 1683 he became tutor to the son of Dean Stillingfleet, a position which gave him access to the best private library in England, and brought him into contact with many of the learned men of the day. In 1689 he accompanied his pupil to Oxford where he soon became intimate with many distinguished scholars. Dr. John Mill, who was producing from a Bodleian ms. the *editio princeps* of John Malalas, requested Bentley to look through the sheet and make remarks on the text. This gave rise to Bentley's *Epistola ad Millium* (1691), a short tractate which at once made it clear to students that there had arisen in England a critic fit to be ranked with the great Grecians of a former age. Unfortunately the work had a tone of presumptuous confidence which tended to rouse enmity.

In 1690 Bentley had taken deacon's orders; in 1692 he was appointed first Boyle lecturer, a nomination which was repeated in 1694. In the first series of lectures ("A Confutation of Atheism") he tried to frame the Newtonian physics, in opposition to Hobbes, into a proof of the existence of an intelligent Creator. In 1693 he became keeper of the Royal library, and in 1695 a fellow of the Royal Society. During these years he had produced casual literary work for other scholars, and in 1697 Wotton, who was preparing a second edition of his *Ancient and Modern Learning*, asked Bentley to write a paper exposing the spuriousness of the *Epistles of Phalaris*. The Christ Church editor of *Phalaris*, Charles Boyle, afterwards earl of Orrery, wrote a witty and superficial reply which was hailed by the public as crushing Bentley

therefore rejoined (1699) with the *Dissertation on the Epistles of Phalaris* (see PHALARIS).

In the year 1700 Bentley was chosen master of Trinity college, Cambridge, which had fallen from its high estate, and become the haunt of indolent clerics, who cared not at all for learning but much for good living. Bentley, obnoxious as a St. John's man and an intruder, unwelcome as a man of learning whose interests lay outside the walls of the college, proceeded to ride roughshod over their little arrangements. He inaugurated many reforms in usages and discipline, executed extensive improvements in the buildings, and promoted learning both in the college and in the university. But his domineering temper, his contempt for their feelings and rights, drove the fellows in 1710, after ineffectual resistance within the college, to appeal to the bishop of Ely. Only the bishop's death in 1714 prevented Bentley's ejection from the mastership. In 1733 he was again brought to trial before the bishop of Ely (Dr. Greene) by the fellows of Trinity and was sentenced to deprivation, but the college statutes required the sentence to be exercised by the vice-master, who refused to act. Though the feud was kept up till 1738 or 1740 (about 30 years in all) Bentley remained undisturbed.

During these years he published a critical appendix to John Davies's edition of Cicero's *Tusculan Disputations* (1709); emendations on the *Plutus* and *Nubes* of Aristophanes, and on the fragments of Menander and Philemon (1710); *Remarks on a late Discourse of Freethinking* (1712). His *Horace*, written in very great haste at a critical period of the Trinity quarrel, appeared in 1711. Some of its 700 or 800 emendations have been accepted, but the majority of them are now rejected, despite the learning and ingenuity shown in their support. In 1720 appeared his *Proposals for a New Edition of the Greek Testament* in which he proposed, by comparing the text of the Vulgate with that of the oldest Greek mss., to restore the Greek text as received by the Church at the time of the Council of Nice, but the work was never completed. His *Terence* (1726) deals chiefly with the bearing of metrical questions upon emendation, and it is upon this, next to the *Phalaris*, that his reputation mainly rests. To the same year belong the *Fables of Phaedrus* and the *Sententiae* of Publius Syrus. The *Paradise Lost* (1732), is generally regarded as his most unsatisfactory work. It is marred by the same rashness in emendation and lack of poetical feeling as his *Horace*. He put forward the idea that Milton employed both an amanuensis and an editor, who were to be held responsible for the clerical errors, alterations and interpolations which Bentley professed to detect. Among his minor works may be mentioned the *Astronomica* of Manilius (1739); a letter on the Sigeian inscription on a marble slab found in the Troad, now in the British Museum; notes on the *Theriaca* of Nicander and on Lucan; emendations of Plautus (in his copies of the editions by Pareus, Camerarius and Gronovius, edited by Schröder, 1880, and Sonnenschein, 1883). *Bentleyi Critica Sacra* (1862), edited by A. A. Ellis, contains the epistle to the Galatians (and excerpts), printed from an interleaved folio copy of the Greek and Latin Vulgate in Trinity college. A collection of his *Opuscula Philologica* was published at Leipzig in 1781. The edition of his works by Dyce (1836–38) is incomplete.

He had married in 1701 Joanna, daughter of Sir John Bernard of Brampton in Huntingdonshire. She died in 1740, leaving a son, Richard, and two daughters, and Bentley himself died of pleurisy two years later. A few Greek mss., brought from Mount Athos, he left to the college library.

Bentley was the first, perhaps the only, Englishman who can be ranked with the great heroes of classical learning. Self-taught, he created his own science; and it was his misfortune that there was no contemporary guild of learning in England by which his power could be measured. The English school of Hellenists, by which the 18th century was distinguished, and which contains the names of R. Dawes, J. Markland, J. Taylor, J. Toup, T. Tyrwhitt, Richard Porson, P. P. Dobree, Thomas Kidd and J. H. Monk, was the creation of Bentley. Even the Dutch school of the same period, though the outcome of a native tradition, was stimulated and directed by the example of Bentley, whose letters to the young Hemsterhuis on his edition of Julius Pollux made him one of

Bentley's most devoted admirers; and the German school of the 19th century did ungrudging homage to his genius as "the founder of historical philology."

Poetry, XV., 1924).

BENTLEY, RICHARD (1794-1871), British publisher, was born in London. His father owned the *General Evening Post* in conjunction with John Nichols. With his brother Samuel (1785-1868), an antiquarian of some repute, he set up a printing establishment, but in 1829 he began business as a publisher in partnership with Henry Colburn in New Burlington street. Colburn retired in 1832 and Bentley continued business on his own account. In 1837 he began *Bentley's Miscellany*, edited for the first three years of its existence by Charles Dickens, whose *Oliver Twist*, with Cruikshank's illustrations, appeared in its pages. Bentley and his son George (1828-95), as Richard Bentley & Son, published works by R. H. Barham, Theodore Hook, Isaac D'Israeli, Judge Haliburton, and others; also the "Library of Standard Novels" and the "Favourite Novel Library." In 1866 the firm took over the publication of *Temple Bar*, with which *Bentley's Miscellany* was afterwards incorporated. After Richard Bentley's death his son, George Bentley, and his grandson, Richard Bentley, junior, continued the business until it was absorbed (1898) by Macmillan & Co.

See *R. Bentley & Son* (Edinburgh, 1886), a history of the firm reprinted from *Le Livre* (Oct. 1885).

BENTON, THOMAS HART (1782-1858), American statesman, was born at Hillsborough, Orange county, North Carolina, on March 14, 1782. His father, an Englishman of refinement and scholarship, died in 1790, leaving the boy under the influence of a very superior mother, from whom he received lessons in book learning, piety and temperance, quite unusual in the frontier country. His home studies, facilitated by his father's fine library, were supplemented by a brief stay at the university of North Carolina (Chapel Hill) in 1799. The family removed, probably in this year, to a large tract of land which had been acquired by the father on the outskirts of the Indian country (at Benton Town, now Leipers Fork) near Franklin, Tenn. The following years, during which Benton was at various times school teacher, farmer, lawyer and politician, were the distinctively formative period of his life. His intense democracy and many features of his boldly cast personality were perfectly representative of the border people among whom he lived; although his education, social standing and force of character placed him above his fellows. In 1809 he served a term as State senator. Between 1815 and 1817 he transferred his interests to St. Louis, Mo., and in 1820 was elected U.S. senator from the new State. His senatorial career of 30 years (1821-51) was one of extreme prominence. A friendship early formed in Tennessee for Andrew Jackson was broken in 1813 by an armed fracas between the principals and their friends, but after the presidential election of 1824 Benton became a Jacksonian Democrat and Jackson's close friend, and as such was long the Democratic leader in the Senate, his power being greatest during Jackson's second term. He continued to be the administration's right-hand man under Van Buren, but gradually lost influence under Polk, with whom he finally broke both personally and politically.

The events of Benton's political life are associated primarily with three things: the second U. S. Bank, westward expansion and slavery. In the long struggles over the bank, the deposits and the "expunging resolution" (i.e., the resolution to expunge from the records of the Senate the vote of censure of President Jackson for his removal of the Government deposits from the bank), Benton led the Jackson Democrats. His opposition to a national bank and insistence on the peculiar virtues of "hard money," whence his sobriquet of "Old Bullion," went back to his Tennessee

days. In all that concerned the expansion of the country and the fortunes of the West, no public man was more consistent or more influential than Benton, and none so clear of vision. Reared on the border, and representing a State long the farthestmost outpost across the Mississippi in the Indian country, he held the ultra-American views of his section as regarding foreign relations generally, and the "manifest destiny" of expansion westward especially. It was quite natural that he should advocate the removal westward of the Indian tribes, should urge the encouragement of trade with Santa Fe, N.M., and should oppose the abandonment in the Spanish treaty of 1819 of American claims to Texas. He once thought the Rocky mountains the proper western limit of the United States (1824), but this view he soon outgrew. He was the originator of the policy of homestead laws by which the public lands were used to promote the settlement of the West by home-seekers. No other man was so early and so long active for transcontinental railways. But Benton was not a land-grabber, whether in the interest of slavery or of mere jingoism. In the case of Oregon, for instance, he was firmly against joint occupation with Great Britain, but he was always for the boundary of 49° and never joined in the jingo campaign cry of "Fifty-four Forty or Fight." It was he who chiefly aided Polk in withdrawing from that untenable position. He despised pretexts and intrigues. Both in the case of Oregon and in that of Texas, though one of the earliest and most insistent of those who favoured their acquisition, yet in the face of southern and western sentiment he denounced the sordid and devious intrigues and politics connected with their acquisition, and kept clear of these. For the same reason he opposed the Mexican War, though not its prosecution, once begun. In the Texas question slavery was prominent. Toward slavery Benton held a peculiarly creditable attitude. A southerner, he was a slaveholder; but he seems to have gradually learned that slavery was a curse to the South, for in 1844 he declared that he would not introduce it into Texas lands "where it was never known," and in 1849 proclaimed that his personal sentiments were "against the institution of slavery." In the long struggle over slavery in the territories, following 1845, he was for the extreme demands of neither section; not because he was timorous or a compromiser—no man was less of either—but because he stood unwaveringly for justice to both sections, never adopting exaggerated views that must or even could be compromised. The truth is that he was always a westerner before he was a southerner and a Union man before all things else; he was no whit less national than Webster. Hence his distrust and finally hatred of Calhoun, dating from the nullification episode of 1832-33. As the South under Calhoun's lead became increasingly sectional and aggressive, Benton increasingly lost sympathy with her. Though he despised political-inaction Abolitionists, and hated their propaganda as inimical to the Union, he would not therefore close the national mails to Abolition literature, nor abridge the right of petition. No statesman was more prescient of the disunion tendencies of Calhoun's policies, and as early as 1844 he prophetically denounced the treason to the Union toward which the South was drifting. He would not drift with her for the sake of slavery, and this was his political undoing. In 1851 Missouri rejected him in his sixth candidacy for the Senate, after he had been an autocrat in her politics for 30 years. In 1852 he was elected to the House of Representatives, but his opposition to the repeal of the Missouri Compromise caused his defeat in 1854. An unsuccessful campaign for the governorship of Missouri in 1856 ended his political career. He died at Washington on April 10, 1858.

Benton's entire career was eminently creditable, and he is, besides, one of the most picturesque figures in American political history. His political principles—whether as regarded lobbying, congressional jobbing, civil service or great issues of legislation and foreign affairs—were of the highest. He was so independent that he had great dislike for caucuses, and despised party platforms—although he never voted other than the Democratic ticket, even when his son-in-law, J. C. Frémont, was the Republican presidential candidate in 1856; nor would he accept instructions from the Missouri legislature. His career shows no truckling to

self-interest, and on large issues he outgrew partisanship. Although palpably inferior to each of his great senatorial colleagues, Webster, Clay and Calhoun, in some gifts, yet if character, qualities and career be taken in the whole, his were possibly the most creditable of all. Benton was austere, aggressive and vain; besides, he had a fatal deficiency of humour. Nevertheless, he had great influence, which was a deserved tribute to his ability and high character. An indefatigable student, he treated all subjects capably, and especially in questions of his country's history and the exploration of the West had few equals—in the latter none. He acted always with uncalculating boldness, and defended his acts with extraordinary courage and persistence. Benton wrote a *Thirty Years' View . . . of the American Government* (2 vols., 1854–56), characteristic of the author's personality; it is of great value for the history of his time. He also compiled an *Abridgment of the Debates of Congress, 1789–1850* (16 vols., 1857–61), likewise of great usefulness; and published a bitter review of the Dred Scott decision full of extremely valuable historical details—*Historical and Legal Examination of . . . the Dred Scott Case* (1857). All were written in the last eight years of his life and mostly in the last three.

The best biography is that by W. M. Meigs, *Life of Thomas Hart Benton* (1904). See also Theodore Roosevelt's *Thomas Hart Benton* (1887), in the "American Statesmen" series, which admirably brings out Benton's significance as a western man; and Joseph M. Rogers's *Thomas Hart Benton* (1905) in the "American Crisis" series.

BENTON, a city of Illinois, U.S.A., 80m. S.E. of St. Louis, the county seat of Franklin county, the leading coal-producing county of the State. It is served by the Chicago and Eastern Illinois, the Illinois Central and the Missouri Pacific railways. The population was 7,201 in 1920 and was estimated locally at over 10,000 in 1928. Grain, livestock and fruits are the leading agricultural products. The manufactures include window display fixtures, harness and saddlery and enamelled stoves.

BENTON HARBOR, a city of Berrien county, Michigan, U.S.A., on the St. Joseph river, about 1m. from Lake Michigan, with which it is connected by a ship-canal, and 1m. north-east of St. Joseph. It is served by the Michigan Central, the Pere Marquette, and the Big Four railways, and by steamboat lines. The population in 1920 was 12,123. Benton Harbor and St. Joseph are joined by a wide street, parallel to the canal, lined with docks, factories, and business houses. Their combined population in 1928 was estimated locally at over 30,000, and this is doubled in summer by visitors in search of health and recreation at the mineral springs and pleasure resorts.

Benton Harbor has a large trade in peaches, grapes, pears, cherries, berries and apples. The leading industries are fruit-canning and the manufacture of special machinery and all kinds of castings. The output of its 64 diversified establishments in 1925 was valued at \$11,124,200. Benton Harbor was called Bronson Harbor until 1865. It was incorporated as a village in 1869, as a city in 1891.

BENUE, a river of the Cameroons and Northern Province of Nigeria in West Africa and the largest and most important affluent of the Niger (*q.v.*), which it joins after a course of over 800m. in a general east to west direction from its source in the mountains of Adamawa. Through the Tuburi marshes there is a water connection between the Benue (Niger) and Shari (Lake Chad) systems.

BEN VENUE, a mountain in south-west Perthshire, Scotland. Principal peaks are 2,393 and 2,386ft. (See PERTSHIRE.)

BENZ, KARL (1844–), German engineer, was born at Karlsruhe Nov. 26 1844. In 1879 he constructed a two-stroke engine model of his own, and founded an engine factory. As, however, the group financing him would only deal with fixed engines, he left it. He founded the firm Benz and Co., Rheinische Gasmotorenfabrik, and began to construct fixed engines; then developed a light high-speed four-stroke engine (300 revolutions, $\frac{3}{4}$ H.P.). He discovered the differential, special electrical battery ignition with spark induction, surface carburettor. He completed his first car in 1885, speed 10–16km. per hour, and took out the patent in 1886 (D.R.P. 37435). He sold the first car to the Frenchman, Roger, and then joined the firm of Panhard

and Levassor. In England he encountered difficulties owing to the Locomotives Act (not abolished till 1896); and in 1893 he took out a patent for steering gear with triple axle and steering rods tangential to the wheels. Later, he took up his residence in Mannheim.

BENZALDEHYDE (oil of bitter almonds) was first isolated in 1803 and was the subject of an important investigation by J. v. Liebig in 1837. It occurs naturally in the form of the glucoside amygdalin ($C_{20}H_{27}NO_{11}$) (*q.v.*) which is present in bitter almonds, cherries, peaches and the leaves of the cherry laurel; and is obtained from this substance by hydrolysis with dilute acids. (See GLUCOSIDES, NATURAL.) It occurs free in bitter almonds, being formed by an enzyme decomposition of amygdalin. It may also be prepared by oxidizing benzyl alcohol (*q.v.*) with concentrated nitric acid; by distilling a mixture of calcium benzoate and calcium formate; by the two Gattermann syntheses (see ALDEHYDES), and by the action of chromium oxychloride on toluene dissolved in carbon bisulphide (A. Étard, 1884). It is the simplest of the aromatic aldehydes, having the formula C_6H_5CHO .

Technically it is prepared from toluene, by converting it into benzyl chloride, which is then heated with lead nitrate. $C_6H_5CH_2Cl + Pb(NO_3)_2 = 2NO_2 + PbCl_2 + C_6H_5CHO$, or, by converting it into benzylidene chloride (benzal chloride), which is heated with milk of lime under pressure.

The direct oxidation of toluene with various metallic oxides (manganese dioxide, ceric oxide, peroxides of nickel and cobalt) in presence of acid leads to benzaldehyde free from chlorinated derivatives. Benzaldehyde, a colourless liquid smelling of bitter almonds, boils at $179.1^\circ C$, is only slightly soluble in water, but is readily volatile in steam. It possesses all the characteristic properties of an aldehyde; being readily oxidized to benzoic acid; reducing solutions of silver salts; forming addition products with hydrogen, hydrocyanic acid and sodium bisulphite; and giving an oxime and a hydrazone. On the other hand, it differs from the aliphatic aldehydes in many respects; it does not form an addition product with ammonia but condenses to hydrobenzamide ($C_6H_5CH_2NH_2$); on shaking with alcoholic potash it undergoes simultaneous oxidation and reduction, giving benzoic acid and benzyl alcohol (S. Cannizzaro, 1831); and on warming with alcoholic potassium cyanide it condenses to benzoin (*q.v.*).

During the oxidation of benzaldehyde to benzoic acid when exposed to air it has been observed that as much oxygen is rendered "active" as is used up by the substance undergoing oxidation; thus if benzaldehyde is left for some time in contact with air, water and indigosulphonic acid, just as much oxygen is used up in oxidizing the indigo compound as in oxidizing the aldehyde. A. v. Baeyer and V. Villiger (1900) have shown that a per-acid (*q.v.*) $C_6H_5COO.OH$, formed as an intermediate product, oxidizes the indigo compound, being itself reduced to benzoic acid, they have also shown that this peroxide is soluble in benzaldehyde with production of benzoic acid, and it must be assumed that the oxidation of benzaldehyde proceeds as shown in the equations:

The oxime of benzaldehyde ($C_6H_5CH.NOH$), formed by the addition of hydroxylamine to the aldehyde, undergoes isomeric change when hydrogen chloride is passed into its ethereal solution, a second modification being produced. The former (known as the α - or *anti*-benzaloxime) melts at $34-35^\circ C$; the latter (β - or *syn*-benzaloxime) melts at $130^\circ C$. and is slowly transformed into the α -form. The difference between the two forms has been explained by A. Hantzsch and A. Werner (1890) on the assumption of a different spatial arrangement. (See STEREOCHEMISTRY) On account of the readiness with which it condenses with various compounds, benzaldehyde is an important synthetic reagent. With aniline it forms benzylideneaniline $C_6H_5CH.N.C_6H_5$, and with acetone, benzylideneacetone $C_6H_5CH.CO.CH_3$. Heated with anhydrous sodium acetate and acetic anhydride it gives cinnamic acid (*q.v.*); with dimethylaniline and anhydrous zinc chloride it forms leuco-malachite green $C_6H_5CH[C_6H_4N(CH_3)_2]_2$; and with

dimethylaniline and concentrated hydrochloric acid it gives dimethylaminobenzhydrol, $C_6H_5 \cdot CH(OH)C_6H_4N(CH_3)_2$. (See DYES, SYNTHETIC.) Its addition compound with hydrocyanic acid gives mandelic acid $C_6H_5 \cdot CH(OH) \cdot COOH$ on hydrolysis; when heated with sodium succinate and acetic anhydride, phenyl-*iso*-crotonic acid $C_6H_5 \cdot CH:CH \cdot CH_2 \cdot COOH$ is produced, which on boiling is converted into α -naphthol, $C_{10}H_7 \cdot OH$. On nitration it yields chiefly meta-nitrobenzaldehyde, crystallizing in needles which melt at $58^\circ C$. Ortho-nitrobenzaldehyde may be obtained by oxidizing ortho-nitrocinnamic acid with alkaline potassium permanganate in the presence of benzene; or from ortho-nitrobenzyl chloride by successively condensing it with aniline, oxidizing the product so obtained to ortho-nitrobenzylidene aniline, and then hydrolysing this compound with an acid. It crystallizes in yellowish needles, which melt at $46^\circ C$. It is used in the artificial production of indigo. (See DYES, SYNTHETIC.)

Para-nitrobenzaldehyde crystallizes in prisms melting at $107^\circ C$, and is prepared by the action of chromium oxychloride on para-nitrotoluene, or by oxidizing para-nitrocinnamic acid. By the reduction of ortho-nitrobenzaldehyde with ferrous sulphate and ammonia, ortho-aminobenzaldehyde is obtained. This compound condenses in alkaline solution with compounds containing the grouping, CH_2-CO , to form quinoline (*q.v.*) or its derivatives; thus, with acetaldehyde it forms quinoline, and with acetone, α -methylquinoline.

BENZENE, a hydrocarbon discovered in 1825 by Faraday in the liquid produced in the compression of the illuminating gas obtained by distilling certain oils and fats. Its formula is C_6H_6 . E. Mitscherlich prepared it in 1834 by distilling benzoic acid with lime; and in 1845 Hofmann discovered it in coal-tar. It was named "benzin" or "benzine" by Mitscherlich, but J. v. Liebig proposed "benzol" (the termination *ol* being suggested by the Lat *oleum*, oil); the form "benzene" was due to A. W. Hofmann. The word "benzine" is sometimes used in commerce for the coal-tar product, but also for the light petroleum better known as petroleum-benzine; a similar ambiguity is presented by the word "benzoline," which is applied to the same substances as the word "benzine." "Benzene" is the term used by English chemists, "benzol" is favoured in Germany, and "benzole" in France. There is increasing adoption in England of "benzole" for the name of the fraction in which the hydrocarbon benzene is the chief constituent.

Benzene is manufactured from the low-boiling fractions of the coal-tar distillate (see COAL-TAR). The first successful fractionations of coal-tar naphtha were devised by C. B. Mansfield (1849), who separated a benzol distilling below $100^\circ C$. from a less volatile naphtha by using simple dephlegmators. First, the oil was manufactured principally for combustion in the Read Holiday lamp and for dissolving rubber, but the development of the coal-tar colour industry occasioned a demand for benzols of definite purity. In the earlier stages 30%, 50% and 90% benzols were required, the 30% being mainly used for the manufacture of "aniline for red," and the 90% for "aniline for blue." (The term "30% benzol" means that 30% by volume distils below 100° .) A purer benzol was subsequently required for the manufacture of aniline black and other dye-stuffs. The process originally suggested by Mansfield is generally followed, the success of the operation being principally conditioned by the efficiency of the dephlegmator, in which various improvements have been made. The light oil fraction of the coal-tar distillate, which comes over below 140° and consists chiefly of benzene, toluene and the xylenes (*q.v.*) yields on fractionation (1) various volatile impurities such as carbon disulphide, (2) the benzene fraction boiling at about $80^\circ C$., (3) the toluene fraction boiling at 100° , (4) the xylene fraction boiling at 140° . The fractions are agitated with strong sulphuric acid to separate bases and thiophenes, and then washed with caustic soda solution to remove phenolic substances. The washed products are then refractionated.

Benzene is a colourless, limpid, highly refracting liquid, having a pleasing and characteristic odour. It may be solidified to rhombic crystals which melt at $5.4^\circ C$. Mansfield obtained perfectly pure benzene by freezing a carefully fractionated sample.

It boils at 80.4° , and the vapour is highly inflammable, the flame being extremely smoky. Its specific gravity is 0.899 at $0^\circ C$. It is very slightly soluble in water, more soluble in alcohol and completely miscible with ether, acetic acid and carbon disulphide. It is an excellent solvent for gums, resins, fats and many other organic materials; sulphur, phosphorus and iodine also dissolve in it. It sometimes separates with crystals of a solute as "benzene of crystallization," as for example with triphenylmethane, thio-p-tolyl urea, tropine, etc.

Benzene is of exceptional importance commercially on account of the many compounds derivable from it, which are exceedingly valuable in the arts. Chemically it is one of the most interesting substances known, since it is the parent of the enormous number of substances belonging to the "aromatic" or "benzenoid" series. The constitution of the benzene ring, the isomerism of its derivatives, and their syntheses from aliphatic or open-chain compounds, are treated in the article CHEMISTRY: Organic, HOMOCYCLIC. A summary of its chemical transformations may be given here, but reference should be made to the articles on the separate compounds for further details.

Passed through a red-hot tube, benzene vapour yields hydrogen, diphenyl, diphenylbenzenes and acetylene; the formation of the last compound is an instance of a reversible reaction, since Berthelot found that acetylene passed through a red-hot tube gave some benzene. Benzene unites with ozone to form the triozone, which is decomposed by water with the production of glyoxal and hydrogen peroxide. When its vapour mixed with air is passed over vanadium pentoxide benzene is oxidized to 1% benzoquinone and maleic anhydride. Hexamethylene (cyclo-hexane or hexahydrobenzene) is produced on passing hydrogen and benzene vapours over reduced nickel at 180° . The reverse change to benzene and hydrogen occurs when hexamethylene is passed over nickel at 280° . Chlorine and bromine form additional products with moist benzene in sunlight. Substitution products are formed with the halogens, but only slowly unless a catalyst, such as iodine, molybdenum chloride or ferric chloride for chlorine, and aluminium bromide for bromine, be present. Benzene is readily nitrated to nitro-benzene, two and even three nitro groups being introduced if some dehydrator such as concentrated sulphuric acid be present. Sulphuric acid gives with benzene mono-, di- and even tri-sulphonic acids.

BENZIDINE is $NH_2 \cdot C_6H_4 \cdot C_6H_4 \cdot NH_2$, an important chemical base of the aromatic or coal-tar group crystallizing in colourless plates that melt at $127^\circ-128^\circ C$; it owes its origin to a noteworthy series of chemical changes arising from the reduction of nitrobenzene in alkaline media. Removal of oxygen from two molecular proportions of nitrobenzene leads to red azobenzene (see AZO-COMPOUNDS), $2C_6H_5 \cdot NO_2 \rightarrow C_6H_5 \cdot N:N \cdot C_6H_5$, and addition of hydrogen to azobenzene gives rise to colourless hydrazobenzene, a product which undergoes a singular molecular rearrangement on treatment with mineral acids, and has by analogy the constitution $NH_2 \cdot C_6H_4 \cdot C_6H_4 \cdot NH_2$, being, in fact, di-para-diamino-diphenyl.

The Benzidine Conversion or Rearrangement.—In this conversion the nitrogen atoms part company and the phenyl residues swing round, to join together again mainly, in dipara-positions with respect to the resulting amino-groups thus giving benzidine, and, to a less extent, to bring the para-position of one phenyl group into the ortho-position on the other so as to form a small proportion of diphenylene.

Diphenylene is technically unimportant, but benzidine is employed on a considerable scale in the manufacture of azo-colours having the valuable property of dyeing directly on cotton without the intervention of a mordant (see DYES, SYNTHETIC).

Benzidine is manufactured by heating together a mixture of

nitrobenzene (produced by nitrating benzene, *q.v.*), zinc dust and aqueous caustic soda, preferably with addition of alcohol. The colourless stage of the reduction being reached, the alcohol is distilled off, the hydrazobenzene is separated mechanically from zinc and zinc compounds, and dissolved in cold hydrochloric acid. Addition of sodium sulphate to this acid solution precipitates sparingly soluble benzidine sulphate. This salt is suspended in water and decomposed with soda ash, the free benzidine being collected, dried and purified by distillation under reduced pressure.

When cheap electrical energy is available, benzidine is manufactured electrolytically. Nitrobenzene is floated on a strong solution of caustic soda in a one-compartment electrolytic cell and reduced by the nascent hydrogen generated at the cathode; the oxygen simultaneously evolved at the anode is collected and utilized. In order to maintain the hydrazobenzene in the liquid phase a suitable solvent such as *o*-dichlorobenzene is added. On treating this solution of hydrazobenzene with cold hydrochloric acid, the benzidine conversion takes place and the base is isolated as in the foregoing chemical reduction.

The electrolytic process is also effective in the case of *tolidine* or 2:2'-dimethylbenzidine (1), a base which is also used extensively in colour manufacture.

Another valuable diamine of this series is *dianisidine* or 2:2'-dimethoxybenzidine (2), which gives rise to direct-cotton colours having special tinctorial properties. This technical use of benzidine and its allies is based on their diazotization to bisdiazonium salts, $\text{ClN}_2\text{---C}_6\text{H}_4\text{C}_6\text{H}_4\text{---N}_2\text{Cl}$ (see DIAZO-COMPOUNDS), which are then combined with various naphthylaminesulphonic acids and naphtholsulphonic acids giving rise to bisazo dyes which are substantive on unmordanted cotton.

BENZOIC ACID occurs naturally in some resins, especially in gum benzoin (from *Styrax benzoin*), in dragon's blood, and as a benzyl ester in Peru and Tolu balsams. It crystallizes from water in glistening leaflets which melt at 121.4° C and boil at 249.2° C. Its specific heat is 0.1946. It sublimes readily and is volatile in steam. It is readily soluble in hot water and the ordinary organic solvents. Benzoic acid is the simplest representative of the organic acids in the aromatic series (see CHEMISTRY, Organic). It may be regarded as derived from the hydrocarbon benzene, C_6H_6 , through the replacement of one hydrogen atom by the acidic (carboxyl) group, ---COOH ; its formula is thus $\text{C}_6\text{H}_5\text{COOH}$. When heated with lime, it is decomposed, benzene being formed; if its vapours are passed over heated zinc dust, it is converted into benzaldehyde (A. Baeyer, 1806). Distillation of its calcium salt gives benzophenone (*q.v.*) with small quantities of other substances, but if the calcium salt be mixed with calcium formate and the mixture distilled, benzaldehyde is produced. By the action of sodium amalgam on an aqueous solution of the acid, benzyl alcohol, tetrahydrobenzoic acid and hexahydrobenzoic acid are formed. The salts of benzoic acid, known as benzoates, are mostly soluble in water. They are decomposed by mineral acids with the production of benzoic acid, and on addition of ferric chloride to their neutral solutions give a reddish-brown precipitate of ferric benzoate. Benzoic acid is usually prepared from toluene, this hydrocarbon being chlorinated to benzotrichloride, $\text{C}_6\text{H}_5\text{CCl}_3$; this is heated with water or aqueous alkali, milk of lime being employed commercially, and the resulting calcium benzoate is then decomposed by mineral acid to yield free benzoic acid. It is also obtained by oxidizing benzaldehyde (*q.v.*), benzyl alcohol, or cinnamic acid. It also arises in many reactions of aromatic substances, as for instance by hydrolysis of benzonitrile; by the action of carbon dioxide on benzene in the presence of aluminium chloride (C. Friedel and J. M. Crafts, 1888); by the action of carbon dioxide on monobromobenzene in the presence of sodium; by passing carbon dioxide into an ethereal solution of phenyl magnesium bromide (see GRIGNARD REAGENTS); by condensing benzene and carbonyl chloride in presence of aluminium

chloride, the benzoyl chloride formed being subsequently hydrolyzed; and similarly from benzene and chloroformamide with subsequent hydrolysis (*q.v.*) of benzamide. It may also be prepared by boiling benzyl chloride with dilute nitric acid (G. Lunge, 1877), or by fusing sodium benzene sulphonate with sodium formate. Benzoic acid can be extracted from the hippuric acid found in the urine of the herbivora. This urine is concentrated and the hippuric acid, precipitated by the addition of hydrochloric acid, is then boiled with concentrated hydrochloric acid until hydrolyzed into benzoic and aminoacetic acids.

Benzoic anhydride ($\text{C}_6\text{H}_5\text{CO}$)₂O, prepared by the action of benzoyl chloride on sodium benzoate, or by heating benzoyl chloride with anhydrous oxalic acid (R. Anschütz, 1884), crystallizes in needles, melting at 42° C, and boiling at 360° C. It is insoluble in water but readily soluble in alcohol and ether.

Benzoyl chloride, $\text{C}_6\text{H}_5\text{COCl}$, a typical acid chloride, is formed by distilling a mixture of phosphorus pentachloride and benzoic acid; by the action of chlorine on benzaldehyde, or by passing a stream of hydrogen chloride over a mixture of benzoic acid and phosphoric oxide heated to 200° C. (C. Friedel, 1869.) It is a colourless liquid of very unpleasant smell, which boils at 198° C., and solidifies in a freezing mixture, the crystals obtained melting at -1° C. When triturated with powdered silver nitrate, benzoyl chloride is converted into benzoyl nitrate $\text{C}_6\text{H}_5\text{CO.ONO}_2$ (F. Francis, 1900). This nitrate explodes on heating, but in non-hydroxylic media it serves as a nitrating agent for aromatic substances; it slowly changes into its isomeride meta-nitrobenzoic acid, $\text{NO}_2\text{---C}_6\text{H}_4\text{CO}_2\text{H}$.

Ethyl benzoate, $\text{C}_6\text{H}_5\text{CO.OC}_2\text{H}_5$, prepared by boiling benzoic acid and alcohol with a small quantity of sulphuric acid for some hours (E. Fischer and A. Speier, 1896), is a colourless liquid of boiling point 213° C.

Benzamide, $\text{C}_6\text{H}_5\text{CO.NH}_2$, prepared by the action of benzoyl chloride on ammonia or ammonium carbonate, or from ethyl benzoate and ammonia, crystallizes from water in glistening leaflets which melt at 130° C and boil at 288° C. (See ACID-AMIDES.)

Chlor-, brom-, iodo- and fluor-benzoic acids are obtained by oxidizing the corresponding halogenated toluenes, or from the amino acids, or by substitution. Nitration of benzoic acid gives chiefly *meta*-nitrobenzoic acid. The ortho- and para-nitrobenzoic acids are obtained by oxidizing ortho- and para-nitro-cinnamic acids. Ortho-amino-benzoic acid (anthranilic acid):

$\text{NH}_2\text{---C}_6\text{H}_4\text{CO}_2\text{H}$ is closely related to indigo (*q.v.*).

Gum benzoin, which contains from 12 to 20% of benzoic acid, is used in medicine as the essential constituent of benzoated lard, *Adeps benzoatus*, which owes its antiseptic properties to benzoic acid; and in friar's balsam, *Tinctura benzoini composita*, which is an ancient and valuable medicament, still largely used for inhalation in cases of laryngitis, bronchitis and other inflammatory or actually septic conditions of the respiratory tract. It owes its value to the benzoic acid which it contains. A fluid drachm of friar's balsam may be added to a pint of water at a temperature of about 140°, and the resultant vapour may be inhaled from the spout of a kettle or from a special inhaler. Benzoic acid itself, ammonium benzoate and sodium benzoate are all administered internally in doses of from five to 30 grains. The ammonium salt is most often employed, owing to the stimulant character of the ammonium base. The acid itself is a powerful antiseptic. When administered internally, it causes the appearance of hippuric acid in the urine. This is due to its combination in the body (kidney) with glycine. The hippuric acid in the urine acts as a stimulant and disinfectant to the urinary mucous membrane. Benzoic acid is also excreted by the bronchi and tends to disinfect and stimulate the bronchial mucous membrane. Hence the value of friar's balsam. The acid and its salts are antipyretic and were used in Germany instead of salicylates in rheumatic fever. But the most important fact is that ammonium benzoate is largely used—often in combination with urinary anodynes such as tincture of hyoscyamus—as a urinary antiseptic in cases of cystitis (inflammation of the bladder) and pyelitis (inflammation of the pelvis of the kidney).

BENZON or **GUM BENJAMIN**, a balsamic resin obtained from *Styrax Benzoïn*, a tree of considerable size, native to Sumatra and Java, and from other species of *Styrax*. It is obtained by making incisions in the bark of the trees, and appears to be formed as the result of the wound, not to be secreted normally. There are several varieties of benzoïn in commerce: (1) Siam benzoïn, which apparently comes from *S. tonkinense* is the finest and most aromatic. The odour of Siam benzoïn is partly due to the presence of vanillin, and it contains as much as 38% of benzoic acid but probably no cinnamic acid. (2) Sumatra benzoïn occurs only in masses formed of dull red resin enclosing small white masses. It contains about 20% of cinnamic acid in addition to 18 or even more of benzoic. (3) Palembang benzoïn, an inferior variety, said to be obtained from *Styrax Benzoïn* in Sumatra, consists of greyish translucent resinous masses, containing small white opaque masses. It does not appear to contain cinnamic acid. Large quantities of benzoïn are used as incense. Its medicinal uses depend on the contained benzoic acid (*q.v.*). Compound tincture of benzoïn is used in treatment of respiratory diseases, etc.

Benzoïn, in chemistry, is a colourless, crystalline solid, readily soluble in alcohol and ether, melting at 137° C. and boiling at 343–344° C. It owes its name to the circumstance that it is a polymeride of benzaldehyde, $C_6H_5 \cdot COH$, which in turn derives its name from benzoic acid (*q.v.*). This acid was first discovered in *Gum benzoïn* (1608) from which material the acid may be obtained by sublimation (*acidum benzoicum ex resina*). It partakes of the structure and properties both of a ketone and an alcohol (*qq.v.*), having the structural formula $C_6H_5 \cdot CH(OH) \cdot CO \cdot C_6H_5$. It may be prepared by boiling an alcoholic solution of benzaldehyde with potassium cyanide; by reducing benzil ($CH_3 \cdot CO \cdot CO \cdot C_6H_5$) with zinc and acetic acid; or by the oxidation of hydrobenzoïn

Owing to the readiness with which it is oxidized, it acts as a reducing agent, giving a red precipitate of cuprous oxide with Fehling's solution in the cold. Chlorine and nitric acid oxidize it to benzil; chromic acid mixture and potassium permanganate, to benzoic acid and benzaldehyde. On heating with zinc dust, desoxybenzoïn ($C_6H_5 \cdot CO \cdot CH_2 \cdot C_6H_5$) is obtained; sodium amalgam converts it into hydrobenzoïn; and fuming hydriodic acid at 130° C. gives dibenzil ($C_6H_5 \cdot CH_2 \cdot CH_2 \cdot C_6H_5$).

BENZOPHENONE is the simplest ketone (*q.v.*) in the aromatic series (see *CHEMISTRY: Organic*). It is structurally a diphenyl ketone, having the formula $C_6H_5 \cdot CO \cdot C_6H_5$. It is a dimorphous substance, existing in two enantiotropic forms, one melting at 26° C and the other at 48° C (Th. Zincke, 1871). It boils at 306.1° C. It may be prepared by distilling calcium benzoate; by condensing benzene with benzoyl chloride in the presence of anhydrous aluminium chloride; by the action of mercury diphenyl on benzoyl chloride, or by oxidizing diphenylmethane with chromic acid. It is reduced by sodium amalgam to *benzhydrol* or *diphenylcarbinol* $C_6H_5 \cdot CH(OH) \cdot C_6H_5$; a stronger reducing agent, such as hydriodic acid in the presence of amorphous phosphorus converts it into *diphenylmethane* (C_6H_5)₂CH₂. Potash fusion converts it into benzene and benzoic acid. With phenylhydrazine it forms a hydrazone, and with hydroxylamine an oxime, which exists in one form only; if, however, one of the phenyl groups in the oxime be substituted in any way then two stereoisomeric oximes are produced (cf. *STEREOCHEMISTRY*) *Tetramethyl-diamino-benzophenone* or *Michler's ketone*, $CO[C_6H_4N \cdot (CH_3)_2]_2$, melting at 178°, is of technical importance in the manufacture of synthetic dyes. It is prepared by the action of carbonyl chloride on dimethylaniline in the presence of aluminium chloride:

(See *DYES, SYNTHETIC*.)

BENZYL ALCOHOL (*PHENYL CARBINOL*) occurs combined with benzoic acid in Peru balsam, with cinnamic acid in Tolu balsam, with acetic acid in essential oil of jasmine, and also in storax. It is a colourless liquid, with a faint aromatic smell, boiling at 206° C and having the composition $C_6H_5 \cdot CH_2OH$. It may be synthetically prepared by the reduction of benzoyl chloride; by the action of nitrous acid on benzylamine; by boiling benzyl chloride with an aqueous solution of potassium carbonate,

or by the so-called "Cannizzaro" reaction (1881) in which benzaldehyde is shaken up with caustic potash, one half of the aldehyde being oxidized to benzoic acid, and the other half reduced to the alcohol: $2C_6H_5CHO + KOH = C_6H_5COOK + C_6H_5CH_2OH$. On oxidation with nitric acid it is converted into benzaldehyde whilst chromic acid oxidizes it to benzoic acid. If reduced by hydriodic acid and phosphorus at 140° C it gives rise to toluene; toluene and benzoic acid result from its distillation with alcoholic potash.

BEOTHUK, an American tribe of hunters and collectors, resident chiefly upon the coast of Newfoundland where salmon and shell-fish could be obtained to eke out the supply of deer. Their skill as canoemen was commented upon by several early writers, but they were equally at home in the woods. The scanty material culture was characterized by the use of wood for household utensils; stone implements were well made; snow-shoes were of a peculiar type, and red ochre was extensively employed for painting the body, a habit which probably gave rise to the term "Red" Indian. Political organization was relatively slight, though concentrated action, implying recognized authority, was shown in communal deer drives. The Beothuk were gradually forced into the interior of the island by European fishermen and settlers; reduced in numbers, their doom was sealed when, in the eighteenth century, Micmac hunters, equipped with fire-arms, began to swarm over from the mainland. A few survivors may have escaped to Labrador, but the last known Beothuk died in 1829.

See J. P. Hawley, *The Beothuks or Red Indians* (1915).

BEOWULF. The epic of Beowulf, the most precious relic of Old English, and, indeed, of all early Germanic literature, has come down to us in a single ms., written about A.D. 1000, in the Cottonian collection now at the British Museum. The subject of the poem is the exploits of Beowulf, son of Egtheow and nephew of Hygelac, king of the "Gēatas," i.e., the people, called in Scandinavian records Gautar, from whom a part of southern Sweden has received its present name Götland.

The following is a brief outline of the story, which divides itself naturally into five parts.

1. Beowulf, with 14 companions, sails to Denmark, to offer his help to Hrothgar, king of the Danes, whose hall (called "Heorot") has for 12 years been rendered uninhabitable by the ravages of a devouring monster (in human shape) called Grendel, a dweller in the waste, who used nightly to force an entrance and slaughter some of the inmates. Beowulf and his friends are feasted in the long-deserted Heorot. At night the Danes withdraw, leaving the strangers alone. When all but Beowulf are asleep, Grendel enters. One of Beowulf's friends is killed; but Beowulf, unarmed, wrestles with the monster, and tears his arm from the shoulder. Grendel, mortally wounded, escapes from the hall. On the morrow, his bloodstained track is followed until it ends in a distant mere.

2. The Danish king and his followers pass the night in Heorot, Beowulf and his comrades being lodged elsewhere. The hall is invaded by Grendel's mother, who kills and carries off one of the Danish nobles. Beowulf proceeds to the mere, and, armed with sword and corslet, plunges into the water. In a vaulted chamber under the waves, he fights with Grendel's mother, and kills her. In the vault he finds the corpse of Grendel; he cuts off the head, and brings it back in triumph.

3. Richly rewarded by Hrothgar, Beowulf returns to his native land and relates to Hygelac the story of his adventures. The king bestows on him lands and honours, and during the reigns of Hygelac and his son Heardred he is the greatest man in the kingdom. When Heardred is killed in battle with the Swedes, Beowulf becomes king.

4. After Beowulf has reigned prosperously for 50 years, his country is ravaged by a fiery dragon, which inhabits an ancient burial-mound, full of treasure. The royal hall itself is burned to the ground. The aged king, accompanied by 11 chosen warriors, journeys to the barrow. Bidding his companions retire, he takes up his position near the entrance to the mound. The dragon rushes forth, breathing flames. Beowulf is all but overpowered, and the sight is so terrible that his men, all but Wiglaf, son of Weohstan, seek safety in flight. With Wiglaf's aid, Beowulf slays the dragon, but receives his own death-wound. Wiglaf enters the

barrow, and returns to show the dying king the treasures that he has found there. Beowulf names Wiglaf his successor, and ordains that his ashes shall be enshrined in a great mound, placed on a lofty cliff, to be a mark for sailors far out at sea.

5. Amid great lamentation, the hero's body is laid on the funeral pile. The treasures of the dragon's hoard are buried with his ashes; and when the great mound is finished, 12 of Beowulf's most famous warriors ride around it, celebrating the praises of the bravest, gentlest and most generous of kings.

Form of the Poem.—Those portions of the poem that relate the career of the hero in progressive order contain a lucid and well-constructed story, yet the general impression produced by it is that of a bewildering chaos. This effect is due to the multitude and the character of the episodes. A very great part of what the poem tells about Beowulf himself is not presented in regular sequence, but by way of retrospective mention.

Many episodes that have nothing to do with Beowulf himself have been inserted with the seeming intention of making the poem into a sort of cyclopaedia of Germanic tradition. They include many particulars of what purports to be the history of the royal houses, not only of the Gautar and the Danes, but also of the Swedes, the continental Angles, the Ostrogoths, the Frisians and the Heathobards, besides references to matters of unlocalized heroic story such as the exploits of Sigismund. The Saxons are not named, and the Franks appear only as a dreaded hostile power. Of Britain there is no mention; and though there are some distinctly Christian passages, they are so incongruous in tone with the rest of the poem that they must be regarded as interpolations. There is a curiously irrelevant prologue, telling the story of Scyld, the founder of the "Scylding" dynasty of Denmark, and the virtues of his son Beowulf. If this Danish Beowulf had been the hero of the poem, the opening would have been appropriate; but it seems strangely out of place as an introduction to the story of his namesake. If the mass of traditions which it purports to contain be genuine, the poem is of unique importance as a source of knowledge respecting the early history of the peoples of northern Germany and Scandinavia.

The starting-point of all *Beowulf* criticism is the fact (discovered by N. F. S. Grundtvig in 1815) that one of the episodes of the poem belongs to authentic history. Gregory of Tours, who died in 594, relates that in the reign of Theodoric of Metz (511–534) the Danes invaded the kingdom, and carried off many captives and much plunder to their ships. Their king, Chlochilaicus, was attacked and killed by the Franks, who then defeated the Danes in a naval battle, and recovered the booty. The date of these events is ascertained to have been between 512 and 520. An anonymous history written early in the 8th century (*Liber Hist. Francorum*, cap. 19) gives the name of the Danish king as Chochilaicus, and says that he was killed in the land of the Attoarii. Now it is related in *Beowulf* that Hygelac met his death in fighting against the Franks and the Hetware (the Old English form of Attoarii). The primitive Germanic form of the Danish king's name would be *Hugilaikaz*, which by regular phonetic change became in Old English *Hygelac*, and in Old Norse *Hugleikr*. It is true that the invading king is said in the histories to have been a Dane, whereas the Hygelac of *Beowulf* belonged to the "Gēatas" or Gautar. But a work called *Liber Monstrorum*, preserved in two mss. of the 10th century, cites as an example of extraordinary stature a certain "Huiglaucus, king of the Getae," who was killed by the Franks, and whose bones were preserved on an island at the mouth of the Rhine. It is therefore evident that Hygelac, and his expedition belong to the region of historic fact. This suggests the possibility that the persons mentioned as belonging to the royal houses of the Danes and Swedes had a real existence. Other points of contact between *Beowulf* and the Scandinavian records confirm the conclusion that the Old English poem contains much of the historical tradition of the Gautar, the Danes and the Swedes.

Of the hero of the poem no mention has been found elsewhere. But the name (the Icelandic form of which is Bjólfr) is genuinely Scandinavian. It was borne by one of the early settlers in Iceland, and a monk named Biulf is commemorated in the *Liber Vitae*

of the church of Durham. As the historical character of Hygelac has been proved, it is not unreasonable to believe that his nephew Beowulf succeeded Heardred on the throne of the Gautar, and interfered in the dynastic quarrels of the Swedes.

On the other hand the combats with Grendel and his mother and with the fiery dragon belong to the domain of pure mythology. That they have been attributed to Beowulf may not be due solely to the general tendency to connect mythical achievements with the name of any famous hero. The Danish king "Scyld Scēfing," whose story is told in the opening lines of the poem, and his son Beowulf, are plainly identical with Sceldwea, son of Scaef, and his son Beaw, who appear among the ancestors of Woden in the genealogy of the kings of Wessex given in the *Anglo-Saxon Chronicle*. It is a reasonable conjecture that the tales of victories over Grendel and the fiery dragon belong properly to the myth of Beaw. If Beowulf, the champion of the Gautar, had already become a theme of epic song, the resemblance of name might easily suggest the idea of enriching his story by adding to it the achievements of Beaw.

As the name of Beaw appears in the genealogies of English kings, the traditions of his exploits may have been brought over by the Angles, and there is evidence that the Grendel legend was popularly current in this country. In the schedules of boundaries appended to two Old English charters there occurs mention of pools called "Grendel's mere," one in Wiltshire and the other in Staffordshire. The Wiltshire charter that speaks also of a place called *Bēowan hām* ("Beowa's home"), and another Wiltshire charter has a "Scyld's tree" among the landmarks enumerated. The notion that ancient burial mounds were liable to be inhabited by dragons was common in the Germanic world: there is perhaps a trace of it in the Derbyshire place-name Drakelow, which means "dragon's barrow."

The blending of the stories of the mythic Beaw and the historical Beowulf may have been the work of Scandinavian and not of English poets: Prof. G. Sarrazin has pointed out the striking resemblances between the Scandinavian legend of Bodvarr Biarki and that of the Beowulf of the poem. The English epic, which unquestionably derived its historical elements from Scandinavian song, may be indebted to the same source for its general plan, including the blending of history and myth. But considering the late date of the authority for the Scandinavian traditions, the latter may owe some of their material to English minstrels.

Date and Origin.—The forms under which Scandinavian names appear in the poem show that these names must have entered English tradition not later than the beginning of the 7th century. It does not indeed follow that the extant poem is of so early a date; but its syntax is remarkably archaic in comparison with that of the Old English poetry of the 8th century. Although the existing ms. is written in West-Saxon dialect, the phenomena of the language indicate transcription from an Anglian (i.e., a Northumbrian or Mercian) original; and this conclusion is supported by the fact that while the poem contains one important episode relating to the Angles, the name of the Saxons does not occur in it at all. The intercourse of the Angles with Scandinavia, which enabled their poets to obtain new knowledge of the legends of Danes, Gautar and Swedes, may not have ceased until their conversion to Christianity in the 7th century. And even after this event it is probable that down to the end of the 7th century, if not still later, the court poets of Northumbria and Mercia continued to celebrate the deeds of Beowulf and of many another hero of ancient days.

Although the heathen Angles had their own runic alphabet, it is unlikely that any poetry was written down until a generation had grown up trained in the use of the Latin letters learned from Christian missionaries. We cannot determine the date at which some book-learned man, interested in poetry, took down from the lips of a minstrel one of the stories that he had been accustomed to sing. It may have been before 700, much later it can hardly have been, for the old heathen poetry was still in vigorous life. The epic of Beowulf was not the only one that was reduced to writing: a fragment of the song about Finn, king of the Frisians, still survives, and several other heroic poems were possibly writ-

ten down about the same time. As originally dictated, *Beowulf* probably contained the story outlined at the beginning of this article, with the addition of one or two of the episodes relating to the hero himself—among them the legend of the swimming-match. The other episodes were introduced by some later writer, who had heard old heathen songs, the substance of which he preserved by weaving it in an abridged form into the texture of the one great poem which he was transcribing. The Christian passages, which are poetically of no value, may be of any date down to that of the extant ms.

An interesting light on the history of the written text seems to be afforded by the phenomena of the existing ms. The poem is divided into numbered sections, the length of which was probably determined by the size of the pieces of parchment of which an earlier exemplar consisted. Now the first 52 lines, which are concerned with Scyld and his son Beowulf, stand outside this numbering. It may reasonably be inferred that there once existed a written text of the poem that did not include these lines. Their substance, however, is clearly ancient. Many difficulties will be obviated if we may suppose that this passage is the beginning of a different poem, the hero of which was not Beowulf the son of Egtheow, but his Danish namesake. It is true that Beowulf the Scylding is mentioned at the beginning of the first numbered section; but probably the opening lines of this section have undergone alteration in order to bring them into connection with the prefixed matter.

BIBLIOGRAPHY.—The volume containing the *Beowulf* ms. (Vitellius A. xv.) was first described by Humphrey Wanley in 1705, in his catalogue of mss., published as vol. iii. of G. Hickes's *Theaurus Veterum Linguarum Septentrionalium*. The first edition showing competent knowledge of the language was produced in 1833 by J. M. Kemble. Since then editions have been very numerous. The text of the poem was edited by C. W. M. Grein in his *Bibliothek der angelsächsischen Poesie* (1857), and again separately in 1867. Autotypes of the ms., with transliteration by Julius Zupitza, were issued by the Early English Text Society in 1882. The new edition of Grein's *Bibliothek*, by R. P. Wulker, vol. i. (1883), contains a revised text with critical notes. The most serviceable separate editions are those of M. Heyne (7th ed., revised by A. Socin, 1903), A. J. Wyatt (with English notes and glossary, 1898), and F. Holthausen (vol. i., 1905).

Many English translations of the poem have been published (see C. B. Tinker, *The Translations of Beowulf*, 1903). Among these may be mentioned those of J. M. Garnett (6th ed., 1900), a literal rendering in a metre imitating that of the original, J. Earle (1892) in prose; W. Morris (1895) in imitative metre, and almost unintelligibly archaic in diction; C. B. Tinker (1902) in prose; and Sir Archibald Strong (1925) and C. K. Scott-Moncrieff (1926) in verse.

For the bibliography of the earlier literature on *Beowulf*, and a detailed exposition of the theories therein advocated, see R. P. Wulker, *Grundriss der angelsächsischen Literatur* (1882). The views of Karl Müllenhoff may be best studied in his *Beowulf, Untersuchungen über das angelsächsische Epos* (1889). Much valuable matter may be found in B. ten Brink, *Beowulf, Untersuchungen* (1888). The work of G. Sarrazin, *Beowulf-studien* (1888), contains, amid much that is fanciful, not a little that deserves careful consideration. The many articles by E. Sievers and S. Bugge, in *Beiträge zur Geschichte der deutschen Sprache und Literatur* and other periodicals, are of the utmost importance for the textual criticism and interpretation of the poem. See also R. W. Chambers, *Beowulf, an Introduction to the Poem* (1921). (H. Br.; X.)

BEQUEST, the disposition of property by will. Strictly, "bequest" is used of personal, and "devise" of real property. (See LEGACY; WILL OR TESTAMENT)

BÉRANGER, JEAN (1637–1711), known as "the elder," French draughtsman and designer, painter and engraver of ornament, was born on Oct. 28 1637, at Saint Mihiel (Meuse) and died in Paris on Jan. 24 1711. In 1674 he was appointed *dessinateur de la chambre et du cabinet du Roi*, in succession to Gissey, whose pupil he is believed to have been. After the death of Le Brun he was commissioned to compose and supervise the whole of the exterior decoration of the king's ships. His numerous designs were for the most part engraved under his own superintendence, and a collection of them was published in Paris in 1711 by his son-in-law, Thuret, clockmaker to the king, in three books, *Oeuvre de J. Bérain, Ornaments inventés par J. Bérain and Oeuvres de J. Bérain contenant des ornements d'architecture*. M. Guilmard in *Les Maîtres ornemanistes*, gives a list of his published works.

His son JEAN BÉRAIN, "the younger" (1678–1726), was his father's pupil, and exercised the same official functions after his death. CLAUDE BÉRAIN, brother of the elder Jean, was still living in 1726. He was engraver to the king, and executed a good number of plates of ornament and arabesque of various kinds.

BÉRANGER, PIERRE JEAN DE (1780–1857), French song-writer, was born in Paris on Aug. 19, 1780. He received very little formal instruction in his childhood in Paris, where as a schoolboy he witnessed the fall of the Bastille. Later he lived at Péronne with an aunt, who taught him to be a stout republican; and from the doorstep of her inn, on quiet evenings, he would listen to the thunder of the guns before Valenciennes, and fortify himself in his passionate love of France and distaste for all things foreign. In 1802, in consequence of a distressing quarrel, he left his father and began life for himself in the garret of his ever memorable song. For two years he did literary hackwork, when he could get it, and wrote pastorals, epics and all manner of ambitious failures. At the end of that period (1804) he wrote to Lucien Bonaparte, enclosing some of these attempts. He was then in bad health, and in the last state of poverty, mitigated only by the friendship of Judith Frère, with whom he had been already more or less acquainted since 1796, and who continued to be his faithful companion until her death, three months before his own, in 1857. She must not be confounded with the Lisette of the songs; the pieces addressed to her (*La Bonne Vieille*, *Maudit printemps*, etc.) are in a very different vein. Lucien Bonaparte interested himself in the young poet, and transferred to him his own pension of 1,000 francs from the Institute; five years later, through the same patronage, although indirectly, Béranger became a clerk in the university at a salary of another thousand. Meanwhile he had written many songs for convivial occasions, and "to console himself under all misfortunes" in 1812, while he was watching by the sick-bed of a friend, it occurred to him to write down the best he could remember. Next year he was elected to the *Caveau Moderne*, and his reputation as a song-writer began to spread. Manuscript copies of *Les Gueux*, *Le Sénateur*, above all, of *Le Roi d'Yvetot*, a satire against Napoleon, whom he was to magnify so much in the sequel, passed from hand to hand with acclamation; one man sang them to another over all the land of France. He was the only poet of modern times who could altogether have dispensed with printing.

His first collection escaped censure. "We must pardon many things to the author of *Le Roi d'Yvetot*," said Louis XVIII. The second (1821) lost him his situation in the university, and subjected him to a trial, a fine of 500 francs and an imprisonment of three months. At Sainte Pélagie he occupied a room (it had just been quitted by Paul Louis Courier), warm, well furnished, and preferable in every way to his own poor lodging where the water froze on winter nights. A second imprisonment of nine months followed on the appearance of his fourth collection. The government proposed through Laffitte that, if he would submit to judgment without appearing or making defences, he should be condemned only in the smallest penalty. But his public spirit made him refuse the proposal; and he would not even ask permission to pass his term of imprisonment in a *maison de santé*, although his health was more than usually feeble at the time.

In the revolution of July copies of his song, *Le Vieux Drapeau*, were served out to the insurgent crowd. He had been for long the intimate friend and adviser of the leading men; and during the decisive week his counsels went a good way towards shaping the ultimate result. Béranger, however, refused to present himself at court, and used his favour only to ask a place for a friend, and a pension for Rouget de l'Isle, author of the famous *Marseillaise*. In 1848 he was elected to the Constituent Assembly, but soon obtained leave to resign. This was the last public event of Béranger's life. He continued to polish his songs in retirement, visited by nearly all the famous men of France. He numbered among his friends Chateaubriand, Thiers, Jacques Laffitte, Michelet, Lamennais, Mignet. His correspondence is full of wisdom and kindness, with a smack of Montaigne, and now and then a vein of pleasantry that will remind the English reader of Charles Lamb. He occupied some of his leisure in preparing his

own memoirs, and a treatise, which he never completed, on *Social and Political Morality*. He died on July 16, 1857. At his funeral the streets of Paris were lined with soldiers and full of townfolk, silent and uncovered. From time to time cries arose: "*Honneur, honneur à Béranger!*"

Béranger had little toleration for those erotic poets who are absorbed in singing their own loves and not the common sorrows of mankind, "who forget," to quote his own words, "forget beside their mistress those who labour before the Lord." Hence it is that so many of his pieces are political, and so many, in the later times at least, inspired with a socialistic spirit of indignation and revolt. It is by this socialism that he becomes truly modern and touches hands with Burns. (R. L. S.; X.)

Lecomte (1909); *Ma biographie* (his own memoirs) (1858); Paul Boiteau *Vie de Béranger* (1861); *Correspondence de Béranger* ed. by Paul Boiteau (1860); Napoléon Peyrat *Béranger et Lamennais* (1857); A. Arnould *Béranger, ses amis, ses ennemis et ses critiques* (1864); J. Janin *Béranger et son temps* (1866); also Sainte-Beuve's *Portraits contemporains* Vol. i.; J. Garson *Béranger et la légende napoléonienne* (1897); A. Bouille *Béranger* (1908). A bibliography of Béranger's works was published by Jules Brivois in 1876.

BERAR, a sub-province of India, formerly the Hyderabad Assigned Districts, and administered by the British under certain agreements with the Nizam of Hyderabad. From Oct. 1, 1903, the Nizam gave a perpetual lease of the tract to the British Government, and Berar has since then been administered as a division of the Central Provinces (*q.v.*).

BÉRARD, JOSEPH FRÉDÉRIC (1789–1828), French physician and philosopher, was born at Montpellier. His *Doctrines médicales de l'école de Montpellier* (1819) is indispensable to a proper understanding of the principles of the Vitalistic school. From 1823 to 1826 he was professor of medicine at Paris; he was then nominated professor of hygiene at Montpellier. His most important book is his *Doctrines des rapports du physique et du moral* (1823). Bérard held that self-consciousness reveals to us the existence of an immaterial, thinking, feeling and willing subject, the self or soul. Alongside of this there is the vital force, the nutritive power, which uses the physical frame as its organ.

To the *Esprit des doctrines médicales de Montpellier*, published posthumously (1830), the editor, H. Pétiot, prefixed an account of his life and works; see also Damiron, *Phil en France au XIX^e siècle* (1834); C. J. Tissot, *Anthropologie générale* (1843).

BERAT, a town of southern Albania on the Semen (or Osum) river, which is unfordable and crossed by a bridge and seven ferries. The river often overflows its banks, leaving stagnant pools which breed fever-bearing mosquitoes. Pop. (1924) 12,000, of whom nearly seven-eighths are Mohammedans, and the remainder Orthodox, with an Orthodox bishop. The town is on the Valona-Koritsa-Monastir route, and lies in a fertile valley producing maize, tobacco, fruit, vines and olives. The citadel is of no military value and is, moreover, waterless. The surrounding district is very barbarous. In the 13th century it fell under Sicily and then Naples, and was ruled in the 14th and 15th centuries by the Musaki family. Later it became Turkish. In the 18th century Ibrahim of Berat headed the league of Muslims which unsuccessfully revolted against Ali Pasha (1788–1822). Berat was occupied by the Austrians during the World War and by the Italians in 1918.

BERAUN: see **BEROUN**.

BERBER, a town and *mudiria* (province) of the Anglo-Egyptian Sudan. The town is on the right bank of the Nile, 1,140ft. above sea-level, in 18° 1' N., 33° 59' E., and 214m. by rail north-west of Khartoum. Berber was the starting-point of the caravan route, 242m. long, across the Nubian desert to the Red sea at Suakin, a distance covered in seven to twelve days. It was also one of the principal stopping-places between Cairo and Khartoum. The caravan route to the Red sea was superseded in 1906 by a railway, which leaves the Wadi Halfa-Khartoum line at the mouth of the Athara. Berber thus lost much of its importance, though it remains the centre of a considerable local trade. The town, now much diminished in population, is old.

Before its conquest by Egypt in 1820 its ruler owed allegiance to the kings of Sennar. The Mahdists took it on May 26, 1884, and the Anglo-Egyptian army retook it on Sept. 6, 1897.

The capital of the *mudiria* is now Ed Damer, a town near the confluence of the Nile and Athara. At the northern end of the *mudiria* is Abu Hamed, important as a railway junction for Dongola. The best-known of the tribes inhabiting the province are the Hassania, Jaalin, Bisharin and Kimilab. During the rule of the Mahdi most of these tribes suffered severely at the hands of the dervishes. The riverain crops are dhurra, barley, wheat and cotton.

BERBERA, chief town and port of the British Somaliland protectorate, North-East Africa, 155m. S. of Aden, in 10° 26' N., 45° 4' E. Berbera is at the head of a deep inlet, the only completely sheltered haven on the south side of the Gulf of Aden. The harbour is 11 to 13 fathoms deep at the entrance, decreasing to five fathoms near the shore. Ocean-going steamers find ample accommodation. The town is built in two divisions—the native town, to the east; the new town, laid out by the Egyptians (1875–77), to the west. The majority of the better-class houses are of rubble, one-storeyed and flat-roofed. The water-supply is brought to the town by an aqueduct from the hills some 8m. distant. The permanent population is under 10,000; but from October to April the population rises to 30,000 or more by the arrival of caravans from Ogaden and Dolbahanta. The traders bring with them tents on the backs of camels and these are pitched near the native town. Their merchandise consists of sheep and goats, gum and resin, skins and ostrich feathers. Imports are mostly cotton goods, dates, rice and sugar. Direct trade is almost entirely with Aden; its yearly value (1914–28) was about £500,000.

Berbera is said to have been founded by the Ptolemies among the *Barbari* of the adjacent coast lands. It fell subsequently into the possession of Arabs and was included in the Mohammedan state of Adel. At the time of the visit to the town of R. F. Burton and J. H. Speke (1854) it was governed by its own sheiks. In 1870 it was claimed by the khedive Ismail, but was not permanently occupied by Egypt until 1875. In 1884 it passed into the possession of Great Britain (See **SOMALILAND, History**).

BERBERINE, first isolated by Chevalier and Pelletan in 1826, obtained for the most part from either golden-seal (*Hydrastis*) or barberry (*Berberis*) roots. In the former it is accompanied by hydrastine and canadine (tetrahydroberberine) and in the latter by oxyacanthine and berbamine. Berberine, $C_{20}H_{19}O_5N$, is soluble in water, less so in alcohol, and sparingly soluble in ether or chloroform. It crystallizes from water in silky, reddish-yellow needles, or from chloroform in tablets; solvent is retained, so that the melting point varies from 144° C (from ether) to 179° C (from chloroform). A molecule of water is lost in the formation of salts, which are those of a monoacidic base. The hydrochloride, $C_{20}H_{17}O_5N \cdot HCl \cdot 2H_2O$, forms small yellow needles, and on the addition of nitric acid to a solution of a berberine salt, the nitrate is precipitated as greenish-yellow needles. On reduction berberine is converted into the colourless canadine (tetrahydroberberine). The papers on the constitution of berberine (W. H. Perkin, 1899 to 1925) afford excellent examples of the application of oxidation and "exhaustive methylation" methods. The supposed synthesis of berberine (Pictet and Gams, 1911) proved on further examination (Perkin, 1924) to be a synthesis of an isomeride, pseudoberberine and the alkaloid was synthesized for the first time by Perkin, Ray and Robinson in 1925. Berberine is of low toxicity; it formerly had some reputation as a remedy for malaria but it is now little used in medicine.

BERBERS, the name of the various branches of the indigenous "Libyan" race of north Africa. Since the dawn of history the Berbers have occupied the tract between the Mediterranean and the Sahara from Egypt to the Atlantic. The origin of the name is doubtful. Some derive it from the word *βάρβαροι* (barbarians), employed first by the Greeks and later by the Romans. Others attribute it to the Arab conquerors. Tribal titles, *Barabara* and *Berberata*, appear in Egyptian inscriptions of 1700 and 1300 B.C., and the Berbers were known to the Egyptians as "Lebu," "Mashu-

asha," "Tamahu," "Tehennu" and "Kabaka"; a long list of names is found in Herodotus; and the Romans called them Numidae, Gaetuli and Mauri, terms derived respectively from the Greek *νομάδες* (nomads), the name Gued'oula, of a great Berber tribe, and the Hebrew *mahur* (western). In regard to the ethnic relations of the Berbers, on the monuments of Egypt their ancestors are pictured with the comparatively blond features which many of them still display. Though considerable individual differences of type may be found in every village, the Berbers are distinctively a "white" race. Dark hair and brown or hazel eyes are the rule; blue-eyed blonds are found, but their frequency has been considerably overstated. The invaders who have most affected the Berber race are the Arabs, but the two races, with a common religion, often a common government, and the same tribal groupings, have failed to amalgamate to any great extent. The Berber is straightforward, honest, by no means averse to money-making, but not unscrupulous in the methods which he employs to this end, and trustworthy.

Government.—The Berber's village is his state, and the government is vested in an assembly, the *Jemda*, formed of all males old enough to observe the fast of Ramadan. By them are determined all matters of peace or war, legislation, taxation and justice. The executive officer is the *Amin*, a kind of mayor, elected from some influential family in which the dignity is often in practice hereditary. He owes his position to the good-will of his fellows, receives no remuneration, and resigns as soon as he loses the confidence of the people. By him are appointed certain *Temman* (sing. *Tamen*) who act as overseers, though without executive powers, in the various quarters of the village. The poorest Berber has as great a voice in affairs as the richest. The undue power of the *Jemda* is checked by vendetta and a sort of lynch law, and by the formation of parties (*sofs*), within or without the assembly, for trade, political and other purposes. The Berbers are a warlike people who have never been completely subjugated. Every boy on reaching 16 is brought into the *Jemda* and given weapons which he carries till he is sixty. Though each village is absolutely independent as far as its internal affairs are concerned, two or more are often connected by administrative ties to form an *Arsh* or tribe. A number of these tribes form a *Thakebilt* or loose confederation. The Taureg organization, owing to their peculiar circumstances of life, is monarchical. Wars are declared by special messengers; the exchange of sticks or guns renders an armistice inviolable. In some tribes a tablet, on which is inscribed the name of every man fit to bear arms, is placed in the mosque. The Berbers, though Mahomedans, do not observe the prescribed ablutions; they break their fast at Ramadan; and eat wild boar's flesh and drink fig brandy. Saints, both male and female, are paid more reverence by Berbers than by Arabs. Around their tombs their descendants settle, and thus sacred villages, often of considerable size, spring up. Almost every village, too, has its saint or prophet, and disputes as to their relative sanctity and powers cause fierce feuds. The hereditary caste known as Marabouts are frequently in open opposition to the absolute authority of the *Jemda*. They are possessed of certain privileges, such as exemption from the chief taxes and the duty of bearing arms. They often take a foremost part in tribal administration, and are frequently called upon to perform the office of arbitrators in questions of disputed policy, etc. In the *Jemda*, too, the Marabout at times takes the place of honour and keeps order. The Berbers are very superstitious. Their social tendencies are distinctly communistic; property is often owned by the family in common, and a man can call upon the services of his fellow villagers for certain purposes, as the building of a house. Provision for the poor is often made by the community.

Customs and Industries.—In some districts there are peculiar customs, such as the wearing of small silver nose-rings, seen in El-Jofra. The Berbers' weapons are those of the Arab: the long straight sword, the slightly curved and highly ornamented dagger and the long gun. Their villages, however, are often of substantial appearance: with houses of untrimmed stones, occasionally with two storeys, built on hills, and invariably defended by a bank, a stone wall or a hedge. Sometimes their homes are

mere huts of turf or of clay tiles, with mortar made from lime and clay or cow-dung. The sloping roof is covered with reeds, straw or stones. The living room is on the right, the cattle-stall on the left. The dwelling is surrounded by a garden or small field of grain. The second storey is not added till a son marries. In the villages of the western Atlas the greater part of the upper storey consists of a sort of rough verandah. In this district the natives spend the winter in vaults beneath the houses, and, for the sake of warmth, the tenements are built very close. Agriculture, which is carried on in the mountain districts by means of laboriously constructed terraces, is antiquated in its methods. The plough, often replaced on the steeper slopes by the hoe, is similar to that depicted in ancient Egyptian drawings, and hand irrigation is usual. A sickle, toothed like a saw, is used for reaping. Corn is trodden by oxen, and kept in osier baskets narrowing to the top, or clay granaries.

The Berbers have many industries. They mine and work iron, lead and copper. They have olive presses and flour mills and their own millstone quarries, and build mills for the Arabs. They make lime, tiles, woodwork for the houses, domestic utensils and agricultural implements. They weave and dye several kinds of cloth, tan and dress leather and manufacture oil and soap. Without the wheel the women produce a variety of pottery utensils, often of very graceful design and decorated with patterns in red and black. Whole tribes, such as the Beni-Sliman, are occupied in the iron trade; the Beni-Abbas made firearms before the French conquest, and even cannon are said to have been made by boring. Before it was proscribed by the French, the manufacture of gunpowder was general. The native jewellers make excellent ornaments in silver, coral and enamel. In some places wood-carving has been brought to considerable perfection; and native artists engrave on metal both by etching and the burin. The Berbers are keen traders and, after the harvest, hawk small goods, travelling great distances.

A Berber woman has in many ways a better position than her Arab sister. True, her birth is regarded as an event of no moment, while that of a boy is celebrated by great rejoicings, and his mother acquires the right to wear on her forehead the *tazint*, a mark which only the women who have borne an heir can assume. Her husband buys and can dismiss her at will. She has most of the hard work to do, and is little better than a servant. When she is old and past work, especially if she has not been the mother of a male child, she is often abandoned. But she has a voice in public affairs; she has laws to protect her, manages the household and goes unveiled; she has a right to the money she earns; she can inherit under wills, and bequeath property, though to avoid the alienation of real property, succession to it is denied her. But most characteristic is the Berber woman's right to enter into a sacred bond or agreement, represented by the giving of the *anaya*. This is some symbolic object, stick or what not, which passes between the parties to a contract, the obligations under which, if not fulfilled by the contracting parties during their lives, become hereditary. Female saints, too, are held in high honour; and the Berber is monogamous. Among many Berber tribes the eldest daughter's son succeeds. A religious corporation, the *Savia Kartas*, has been ruled over by a woman, the chief's wife. The Berbers consult their women in many matters. Only one woman is really held in low esteem, the *kuata* or "go-between," though her services are only employed in the respectable task of arranging marriages. Berber women are intelligent and hard-working, and, when young, very pretty and graceful. The Berbers do not admire fat women. Among the Kabyles the adulteress is put to death, as are those women who have illegitimate children, the latter suffering with their mothers.

Language.—The Berber language is still spoken by millions of people from Egypt to the Atlantic and from the Mediterranean to the Sudan, and place-names in the Canary Islands and other remains of the aboriginal language there prove it to have been the native tongue. The Berber tongue shows some affinity with Semitic in the construction both of its words and sentences but is quite distinct from the Semitic languages; and the dialects show but slight differences from the long-extinct Hamitic speech

from which all are derived. The Berber language is still essentially one. The Berbers have a writing of their own, peculiar and little used or known, the antiquity of which is proved by monuments and inscriptions ranging over the whole of north Africa. A collection of the various signs of the alphabet has shown thirty-two letters, four more than Arabic. Among the peculiar grammatical features of Berber may be mentioned two numbers (no dual), two genders and six cases, and verbs with one, two, three and four radicals and imperative and aorist tense only. The Berber tongue is most common in Morocco and the western Sahara.

BERBICE, one of the three "counties" of British Guiana (*qv*) associated with the river of the same name.

BERCEO, GONZALO DE (c. 1180-c. 1246), the earliest Castilian poet whose name is known to us, was born at Verceo, a village in the province of Logrono. In 1221 he became a deacon and was attached, as a secular priest, to the Benedictine monastery of San Millan de la Cogolla, in the diocese of Calahorra. He wrote upwards of 13,000 verses, all on devotional subjects. His best work is a life of St. Oria; others treat of the life of St. Millan, of St. Dominic of Silos, of the Sacrifice of the Mass, and the Miracles of Our Lady. Berceo uses the *cuaderna via* (single-rhymed quatrains, each verse being of 14 syllables); he lacks imagination and taste, but he combines directness of vision and a power of selection with a passionate devotion that gives him the supremacy over his French contemporary, Gautier de Coinci, from whom most of his legends of the Virgin are borrowed.

See Comte de Paymaigre, *Les vieux auteurs castillans* (1888), I. pp. 267-300; R. Becker, *Gonzalo de Berceos Milagros und ihre Grund lagen* (Strasbourg, 1910).

BERCEUSE, a cradle-song, the German *Wiegenlied*, a musical composition with a quiet rocking accompaniment. The word is derived from the French for a "lullaby," from *berceau*, a cradle.

BERCHEM or **BERGHEM, NICOLAES** (1620-1683), a Dutch painter, born at Haarlem, and died on Feb. 18, 1683, at Amsterdam. He received instruction from his father (Pieter Claesz van Haarlem) and from the painters Claes Moyaert, Jan Wils and Pieter de Grebber. He seems to have worked in Italy, and most of his numerous landscapes are southern landscapes in bright sunshine. They were in great demand, as were also his etchings and drawings. His finest pictures are at the Amsterdam Museum and at the Hermitage, Leningrad. There are examples in the National Gallery and the Wallace and Dulwich collections in London; in Vienna, Berlin and elsewhere.

BERCHTA, a fairy in South German mythology (English, Bertha), at first a benevolent spirit, later regarded as a witch. In Pagan times she ranked as a minor deity.

BERCHTESGADEN, a town in south-eastern Bavaria, Germany, beautifully situated at a height of 1,700ft., on the Untersberg, south-east Bavaria. Pop. (1925) 3,772. It is celebrated for its extensive mines of rock-salt, worked as early as 1174. The town contains an early Gothic abbey church with Romanesque cloister. The district was formerly an independent spiritual principality, founded in 1100 and secularized in 1803. Toy-making is an old-established local industry.

BERCHTOLD VON UND ZU UNGARSCHITZ, LEOPOLD, COUNT (1863-), Austro-Hungarian statesman, was born April 18 1863, and entered the Austro-Hungarian Foreign Office 1893. In 1903 he went as councillor of legation to St. Petersburg (now Leningrad) and in Dec. 1906 was appointed ambassador there. With the Russian court and the aristocratic society of St. Petersburg he maintained the best relations, but failed entirely in his efforts to accommodate the obviously increasing differences between Russian and Austro-Hungarian policy. He took a leading part in the negotiations preceding the crisis caused by the annexation of Bosnia-Herzegovina, which aimed at securing common action of the two Powers in the Balkan question. It was at his château of Buchlov, in Moravia, that the fateful conference took place between Izvolski and Aehrenthal (Sept. 15 1908). In March 1911 Count Berchtold was recalled from Russia, and on Feb. 17 1912, he was, against his own will, appointed Aehrenthal's successor as foreign minister in the Austro-Hungarian Government.

His efforts were directed toward securing the position of Austria-Hungary in the Balkan peninsula. At this time he considered possible a peaceful solution of the Balkan question by agreement with Russia and the Western Powers. But the obvious efforts of Russian statesmen to weaken the influence of Austria-Hungary in the Balkans, the aggressive activities of the Serbs and the ambiguous behaviour of Bulgaria forced him to change his attitude, especially as he failed to receive from the Western Powers the support which he had sought.

During the three Balkan wars, Oct. 1912 to Aug. 1913, Berchtold's attitude was characterized by weakness and indecision. He repeatedly took steps toward active intervention, but drew back when the Entente Powers used threats, and the other members of the Triple Alliance intervened with counsels of moderation in Vienna. His efforts at the close of the third Balkan War to secure a revision of the Treaty of Bucharest (Aug. 10 1913), which was unfavourable to Bulgaria, were as unsuccessful as his attempt to secure an accommodation between Bulgaria and her rivals by way of direct negotiation. The prestige of Austria-Hungary in the Balkans noticeably declined. Serbia's endeavours to extend her power to the Adriatic and to win recruits for the ideal of Great Serbia among the kindred Slav races of Austria-Hungary became more and more evident. For these reasons, at the conferences at the Ballplatz which followed the murder of the Archduke Francis Ferdinand, the heir to the throne, on June 28, 1914, Berchtold maintained the view that a definitive settlement with Serbia was essential, even at the risk of war with Russia and France.

After the outbreak of the World War he directed his efforts to inducing Italy and Rumania to carry out their obligations and to securing new allies for the Central Powers. These efforts were, for the most part, unsuccessful. Turkey alone joined the Central Powers. Rumania and Italy declared their neutrality; even Bulgaria dragged out the negotiations, though Berchtold offered great concessions in return for her active intervention on the side of Austria-Hungary and Germany. Italy's demands for compensation were acknowledged in principle by Berchtold, under pressure from Germany, but he embarked on the negotiations with hesitation, and to the day of his resignation (Jan. 13 1915) he refused to listen to any proposal for the cession of Austrian territory. In March 1916 Berchtold was appointed Obersthofmeister (lord high steward) to the heir to the throne, Charles Francis Joseph, whom he subsequently served as Oberst-

kämmerer (lord high chamberlain). After the fall of the dynasty he took no further part in politics.

See AUSTRIA.

(A. F. P.)

BERCK, bathing resort, north France, department of Pas-de-Calais, 25m. S. of Boulogne by rail. Pop. (1926) 10,220. It comprises two parts—Berck-Ville, the fishing village, 1½m. from the shore, and Berck-Plage, with a fine sandy beach. The latter is a favourite resort for children, and there are several sanatoria. Herrings form the staple of the active fishing trade. Boat-building and fish-curing are carried on.

BERDIANSK, a port on the Sea of Azov in the Mariupol district of the Ukrainian S.S.R. Lat. 46° 48' N., Long. 36° 44' E. Pop. (1926) 26,409. It has a breakwater extending 1,073 yards enclosing water 9½–15 ft. deep: a canal has been dredged from the harbour to the roads, and a mole was constructed (1863) as a protection against the heavy surf when the south wind blows. There are salt lagoons in the neighbourhood. Its exports are wheat, barley, linseed, hemp, wool and skins, and its imports hardware, fruit, oil and naphtha. It has manufactures of bricks and tiles, tallow and macaroni.

BERDICHEV, the chief town of the Berdichev district of the Ukrainian Socialist Soviet Republic. Lat. 49° 52' N., Long. 28° 30' E. Pop. (1926) 50,554. It is a railway junction, and centre for the exchange of skins, iron and wooden wares, salt fish, grain, cattle and horses. Small industries—tobacco, soap, leather and bricks—are carried on, and fairs are held. In the treaty of demarcation between the Poles and Lithuanians in 1546, Berdichev was assigned to Lithuania. After the capture of Bar, 1768, Pulaski, the leader of the Polish confederacy of Bar fled to Berdichev, which was captured by the Russians after a 25 days' siege. Later the town belonged to the Radziwill family. A fortified Carmelite monastery was founded here in 1627, was plundered by the Zaporogian Cossacks under Chmielnicki in 1647, and disestablished 1864. The Cathedral of the Assumption was completed in 1832.

BEREA, a town of Madison county, Kentucky, U.S.A., in the foot-hills of the Cumberland mountains, at the edge of the blue-grass region, 95m S.E. of Louisville, on the Louisville and Nashville railroad. The population in 1920 was 1,040. Three miles south is the gap through which Daniel Boone passed on his expedition from North Carolina into the Kentucky wilderness. The history of the town is bound up with that of Berea college, which was founded (1855) to promote "the spiritual and material welfare of the mountain region of the South." Instruction is provided (for students over fifteen years of age) through a full college course. Tuition is free, and expenses are kept at a minimum. The annual enrolment is about 2,500. The campus of 140ac. extends along a picturesque ridge, 1,070ft. above sea-level. The lands used for instruction include 50ac. of gardens, 404ac. in farms, and a forest reserve of 5,600 acres. All the work is done by the students, and is a part of the educational scheme. The college supplies water, electric light, ice, fire protection and other services to the village. Berea has been a pioneer in developing unconventional educational methods to meet the needs of its students, and its library serves isolated schools and families, teachers and clergymen, over a wide radius.

BEREKHIAH NAQDAN, Jewish fabulist, author of a Hebrew collection of *Fox Fables*. As his title implies (*Naqdan*, punctuator of the biblical text), Berekhiah was also a grammarian. Most authorities place him in the 13th century, but J. Jacobs has identified him with Benedictus le Puncteur, an English Jew of the 12th century.

BERENGARIUS (d. 1088), mediaeval theologian, born at Tours, was educated in the famous school of Fulbert of Chartres. Later, as director of the cathedral school of his native city, he taught with such success as to attract pupils from all parts of France, and powerfully contributed to diffuse an interest in the study of logic and metaphysics, and to introduce the dialectic development of theology. The earliest of his writings of which we have any record is an *Exhortatory Discourse* to the hermits of his district, written at their own request and for their spiritual edification. It shows a clear discernment of the dangers of the

ascetic life, and a deep insight into the significance of the Augustinian doctrine of grace. Sometime before 1040 Berengarius was made archdeacon of Angers. It was shortly after this that rumours began to spread of his heretical views regarding the sacrament of the Eucharist. Transubstantiation, he held, was contrary to reason, unwarranted by Scripture, and inconsistent with the teaching of men like Ambrose, Jerome and Augustine. He did not conceal this conviction from his scholars and friends, and through them the report spread widely that he denied the common doctrine respecting the Eucharist. His old school companion, Adelman, archdeacon of Liège, wrote to him letters of expostulation in 1046 and 1048; and Bishop Hugo of Langres, wrote (about 1049) a refutation of the views which Berengarius had expressed to him in conversation. Berengarius was not affected by their exhortations, and hearing that Lanfranc, the most celebrated theologian of his day, strongly approved the doctrine of Paschasius and condemned that of "Scotus Eriugena" (really Ratramnus), he wrote to him a letter expressing his surprise and urging him to reconsider the question. Lanfranc, who was then in Rome (1050), brought the letter to the notice of Leo IX. with the result that Berengarius was excommunicated and ordered to appear before the Council of Vercelli which was to be held later on in the year. Before it assembled he was cast into prison, and only when it was too late were the bishop of Angers and other powerful friends able to procure his release. At the council of Tours (1054) he found a protector in the papal legate, the famous Hildebrand, who, satisfied with the fact that Berengarius did not deny the real presence of Christ in the sacramental elements, succeeded in persuading the assembly to be content with a general confession from him that the bread and wine, after consecration, were truly the body and blood of the Lord, without requiring him to define how. At the 1059 council of Rome, Berengarius signed a formula of faith drawn up by Cardinal Humbert and defining the real presence in an extremely realistic manner; but on returning to France he continued to attack the doctrine of transubstantiation, apparently without objection from either his civil or ecclesiastical superiors. Finally, Hildebrand, now Pope Gregory VII., summoned him to Rome, and, in the council of 1078, tried once more to obtain a declaration of his orthodoxy by means of a confession of faith drawn up in general terms; but in the council of the following year Berengarius was forced to acknowledge a change of the bread into the body of Christ which was born of the Virgin Mary, and that the change was *non tantum per signum et virtutem sacramenti, sed in proprietate naturae et veritate substantiae* (not merely by sign and virtue of the sacrament but in the own nature and truth of substance). He was kindly dismissed by the pope not long after, with a letter recommending him to the protection of the bishops of Tours and Angers, and another pronouncing anathema on all who should do him any injury or call him a heretic. Berengarius again recalled his confession, but at the council of Bordeaux (1080), made a final retraction. He passed the rest of his life in retirement and prayer on the island of St. Côme, near Tours, where he died in 1088. He left behind him a number of followers.

The position of Berengarius in the Eucharist controversy rested on his theory that dialectic was *par excellence* the instrument for discovering truth, a theory which concerned the whole question of the relation between faith and reason and which meant that reason was to be the criterion in matters of faith. His objections to transubstantiation were chiefly metaphysical. Accidents, he argued, cannot exist without their substance, even by the power of God, and therefore, if the accidents of bread are present on the altar, their substance, and not that of the body of Christ, will be there. Besides, if Christ is present, and bread alone is seen, there is deception, for Christ, who is God, represents Himself other than He actually is. Again, if Christ is in heaven, as the Scriptures say, He cannot be on earth or on many altars, since nobody can be in different places at the same time. Moreover, we know that the body of Christ after the resurrection became incorruptible; therefore, it cannot be broken with the teeth or daily re-created. This reasoning Berengarius supports by the Bible and the Fathers.

He seems, however, to have admitted the real presence in the Eucharist, for he allowed that, after the consecration the elements undergo a *conversio*, not inasmuch as they lose the *esse* that they have, but in the sense of acquiring something else, that something being the real and invisible body of Christ which constitutes the *res sacramenti*.

The position of Berengarius was not entirely new, for in the 9th century, Ratramnus, a monk of Corbie, had rejected the substantial change in the elements and Eriugena had regarded the Eucharist as merely a memorial. As far as the Church was concerned, the debates with Berengarius led to a clearer exposition of the nature of the change in the sacrament, and an enrichment of the terminology applicable to Eucharistic dogma.

BIBLIOGRAPHY.—The *De sacr. coena adv. Lanfr. liber* of Berengarius was edited by A. F. and F. T. Vischer (1834). His letter to Adelmann is to be found in Martène—Durand: *Thes. nov. anecd.*, iv. 113 (1917). See also the collection of texts in Sudendorf: *Berengarius Turoniensis* (Hamburg, 1850) and the refutations of Berengarius in the works of Adelmann, Lanfranc and Guitmand in Migne's *Patrol. Lat.*; J. Schnitzer, *Berengar v. Tours, sein Leben und seine Lehre* (Munich, 1800); M. Grabmann, *Die Gesch. der Schol. Methode*, v. i (Freiburg, 1900); R. Heurtevent, *Durand de Troarn et les Origines de l'Hérésie bérengérienne* (1912); A. Harnack: *Hist. of Dogma*.

BÉRENGER, ALPHONSE MARIE (1785–1866), known as Bérenger de la Drôme, French lawyer and politician, was born at Valence and entered the magistracy. In 1818 he published *La Justice criminelle en France*, attacking the special courts which were the main instruments of the Reaction and demanding a return to the old customary law and the institution of trial by jury. In 1828 he was elected to the chamber. As president of the parliamentary commission for the trial of the ministers of Charles X. in 1830 he secured a sentence of imprisonment in place of the death penalty. He helped to frame the new criminal code, based on humanitarian principles, which was issued in 1835. He secured, in 1832, the right, so important in French procedure, of juries to find "extenuating circumstances." Under Louis Philippe, Bérenger received many honours (including a peerage, of which he was deprived in 1848). After the Revolution of 1848 his political career ended, but his legal activity continued, and he became president of one of the chambers of the court of cassation. In the interest of the reform of the criminal law and especially the reclamation of young criminals he visited England; publishing the result of his study as *La Répression pénale, comparaison du système pénitentiaire en France et en Angleterre* (1855). His son, René Bérenger (1830–1915), vice-president of the Senate from 1894 to 1897, was also interested in prison reform.

BERENICE or **BERNICE**, the Macedonian forms of the Greek Pherenice, the name of (A) five Egyptian and (B) two Jewish princesses.

(A) 1 **BERENICE**, daughter of Lagus, wife of an obscure Macedonian soldier and subsequently of Ptolemy Soter, with whose bride, Eurydice, she came to Egypt as a lady-in-waiting. Her son, Ptolemy Philadelphus, was recognized as heir over the heads of Eurydice's children. So great was her ability and her influence that Pyrrhus of Epirus gave the name Bereniceis to a new city. Her son Philadelphus decreed divine honours to her on her death. See Theocritus, *Idylls*, xv. and xvii.

2. **BERENICE**, daughter of Ptolemy Philadelphus, wife of Antiochus Theos of Syria, who, according to agreement with Ptolemy (240), had divorced his wife Laodice and transferred the succession to Berenice's children. On Ptolemy's death, Antiochus repudiated Berenice and took back Laodice, who, however, at once poisoned him and murdered Berenice and her son. The prophecy in Daniel xi. 6 seq. refers to these events.

3 **BERENICE**, the daughter of Magas, king of Cyrene, and the wife of Ptolemy III. Euergetes. During her husband's absence on an expedition to Syria she dedicated her hair to Venus for his safe return and placed it in the temple of the goddess at Zephyrium. The hair having by some unknown means disappeared, Conon of Samos, the mathematician and astronomer, explained the phenomenon in courtly phrase by saying that it had been carried to the heavens and placed among the stars. The name *Coma Berenices*, applied to a constellation, commemorates this incident. Callimachus celebrated the transformation in a poem,

of which only a few lines remain, but there is a fine translation of it by Catullus. Soon after her husband's death (221 B.C.) she was murdered at the instigation of her son Ptolemy IV.

4. **BERENICE**, also called **CLEOPATRA**, daughter of Ptolemy X., married as her second husband Alexander II., grandson of Ptolemy VII. He murdered her three weeks afterwards.

5. **BERENICE**, daughter of Ptolemy Auletes, eldest sister of the great Cleopatra. The Alexandrines placed her on the throne in succession to her father (58 B.C.). She married Seleucus Cybiosactes, but soon caused him to be slain and married Archelaus, who had been made king of Comana in Pontus (or in Cappadocia) by Pompey. Auletes was restored and put both Berenice and Archelaus to death in 55 B.C.

(B) 1. **BERENICE**, daughter of Salome, sister of Herod I., and wife of her cousin Aristobulus, who was assassinated in 6 B.C. She was accused of complicity in his murder. By Aristobulus, she was the mother of Herod Agrippa I. Her second husband, Theudion, uncle on the mother's side of Antipater, son of Herod I., having been put to death for conspiring against Herod, she married Archelaus. Subsequently she went to Rome and enjoyed the favour of the imperial household.

2. **BERENICE**, daughter of Agrippa I., king of Judaea, and born probably about A.D. 28. She was first married to Marcus, son of Alexander, head magistrate of the Jews in Alexandria. On his early death she was married to her father's brother, Herod of Chalcis, after whose death (A.D. 48) she lived for some years with her brother, Agrippa II. Her third husband was Polemon, king of Cilicia, but she soon deserted him and returned to Agrippa, with whom she was living in 60 when Paul appeared before him at Caesarea (Acts xxvi.). During the devastation of Judaea by the Romans she fascinated Titus whom, along with Agrippa, she followed to Rome as his promised wife (A.D. 75). When he became emperor (A.D. 79) he dismissed her to her own country. Her influence had been exercised vainly on behalf of the Jews in A.D. 66, but the burning of her palace alienated her sympathies. For her influence see Juvenal, *Satires*, vi., and Tacitus, *Hist.*, ii. 2.

BERENICE, an ancient seaport of Egypt, on the west coast of the Red sea, in 23° 56' N., 35° 34' E. Built at the head of a gulf, the *Sinus Immundus*, or Foul bay, of Strabo, it was sheltered on the north by Ras Benas. The port is now nearly filled up, has a sand-bar at its entrance and can be reached only by small craft. Remnants of a temple's sculptures and inscriptions preserve the name of Tiberius and figures of deities, including a goddess of the emerald mines. Berenice was founded by Ptolemy II. (285–247 B.C.), and named in honour of his mother. It probably replaced an older town, which had long served as the entrepôt of trade between India, Arabia and Upper Egypt. From it a road with watering stations leads north-west across the desert to the Nile at Coptos. In the neighbourhood of Berenice are the emerald mines of Mount Zabara and Sakel.

BERESFORD, CHARLES WILLIAM DE LA POER BERESFORD, 1ST BARON (1846–1919), British admiral, second son of the Rev. John de la Poer Beresford, later 4th marquis of Waterford, was born at Philipstown, King's County, on Feb. 10, 1846, and died on Sept. 6, 1919. He entered the "Britannia" as a naval cadet in 1859. He rose steadily in the navy and in May 1877 was appointed commander of the "Thunderer." From 1879–81 he was in command of the royal yacht "Osborne." He had served under Prince Alfred, duke of Edinburgh, in the "Galatea" in 1868, and in 1875 accompanied the prince of Wales (Edward VII.) on his tour to India. He entered Parliament in 1874 as member for Waterford, and held his seat until 1880; but he was principally known at this period as a sportsman and as a personal friend of the prince of Wales.

At the Egyptian crisis of 1882 he was in command of the gunboat "Condor" in the Mediterranean, and became a popular hero in England in connection with his share of the bombardment of Alexandria (July 11), when he took the leading part in engaging and silencing Fort Marabout in that operation. He was then sent ashore by Captain John (afterwards Lord) Fisher to restore order, which he did with complete efficiency. For this service he was promoted captain, and in Aug. 1884 he was sent to Egypt to

act on the staff of Lord Wolseley in the expedition for the relief of Khartum. He commanded the naval brigade at Abu Klea, Abu Kru, and Metemmeh, and with the naval steamer "Safieh" rescued Sir Charles Wilson and his party, who had been wrecked on returning from Khartum (Feb. 4 1885).

On his return home he became M.P. for East Marylebone, and was made 4th naval lord of the Admiralty under Lord George Hamilton in the Salisbury ministry of 1886, but resigned in Jan. 1888, on account of disagreement with the government's naval programme. Lord Charles was an advocate of the big navy programme, and his criticisms of the government had much to do with the passing of the Naval Defence Act, 1889. In that year he resumed active service afloat, becoming a rear-admiral in 1897. He sat in Parliament for York (1897-1900), and for Woolwich (1902-03). In 1903 he again returned to active service, commanding first the Mediterranean fleet, and then the Channel fleet, retiring in 1909. He became a full admiral in 1906.

During the tenure of the Admiralty by Sir John Fisher (Lord Fisher), he was often in disagreement with the Board, and as soon as he hauled down his flag in March 1909, he attacked the whole policy of the Board of Admiralty in a document addressed to the prime minister. This document was referred to a sub-committee of the Committee of Imperial Defence, which reported, in Aug. 1909 in a sense generally adverse to Lord Charles. He re-entered Parliament as member for Portsmouth in 1910, holding the seat until Jan. 1916, when he went to the House of Lords as Baron Beresford. He was placed on the retired list in 1911, and in 1912 published a book entitled *The Betrayal*, in which he expressed his views on the naval question. *Memories* (1914) is an entertaining book, in which very little is said of the long controversy between him and Lord Fisher. As a flag-officer Lord Charles was extremely popular in the fleet, and showed great energy and ability. Indeed, he was one of the most popular figures in public life. On his death on Sept. 16, 1919, the peerage conferred on him in 1916 became extinct.

BERESFORD, JOHN (1738-1805), Irish statesman, was born on March 14, 1738, a younger son of Sir Marcus Beresford who, having married Catherine, sole heiress of James Power, 3rd earl of Tyrone, was created earl of Tyrone in 1746. After the death of the earl in 1763, Beresford's mother successfully asserted her claim *suo jure* to the barony of La Poer. John Beresford was educated at Trinity college, Dublin, was called to the Irish bar, and entered the Irish parliament as member for Waterford in 1760. He was admitted of the privy council in 1768, and became one of the commissioners of revenue in 1770. In 1780 he became first commissioner of revenue, a position which gave him powerful influence in the Irish administration. He introduced some useful reforms in the machinery of taxation; and he was the author of many improvements in the architecture of the public buildings and streets of Dublin. He was first brought into conflict with Grattan and the popular party, in 1784, by his support of the proposal that the Irish parliament in return for the removal of restrictions on Irish trade should be bound to adopt the English navigation laws. In 1786 he was sworn a member of the English privy council, and the power which he wielded in Ireland through his numerous dependants and connections grew to be so extensive that a few years later he was spoken of as the "king of Ireland." He was a vehement opponent of the increasing demand for relief of the Roman Catholics; and opposed the nomination of Lord Fitzwilliam as lord lieutenant in 1795 for the purpose of carrying out a conciliatory policy. One of Fitzwilliam's first acts was to dismiss Beresford, who appealed to Pitt, and went in person to London to lay his complaint before the English ministers. There is little doubt that the recall of Lord Fitzwilliam (*q.v.*), which was followed by such momentous consequences in the history of Ireland, was, as the viceroy himself believed, mainly due to Beresford's dismissal. There had been a misunderstanding on the point between Pitt and Fitzwilliam. The latter, whose veracity was unimpeachable, asserted that previous to his coming to Ireland, he had informed the prime minister of his intention to dismiss Beresford, and that Pitt had raised no objection. In a letter to Lord Carlisle, justifying his action, Fitzwilliam mentioned that mal-

versation had been imputed to Beresford. Beresford sent a challenge to Fitzwilliam, but the combatants were interrupted on the field and Fitzwilliam then made an apology.

When Lord Camden replaced Fitzwilliam in the viceroyalty in March 1795 Beresford resumed his former position. On the eve of the rebellion in 1798 his letters to Lord Auckland gave an alarming description of the condition of Ireland and he counselled strong measures of repression. When first consulted by Pitt on the question of the union Beresford appears to have disliked the idea; but he soon became reconciled to the policy and warmly supported it. After the union Beresford continued to represent Waterford in the imperial parliament, and he remained in office till 1802, taking an active part in settling the financial relations between Ireland and Great Britain. He died near Londonderry on Nov. 5, 1805. His son, John Claudius, kept a riding school in Dublin, which acquired an evil reputation as the chief scene of the floggings by which evidence was extorted of the conspiracy which came to a head in 1798. He took a prominent part in the Irish House of Commons, where he unsuccessfully moved the reduction of the proposed Irish contribution to the imperial exchequer in the debates on the Act of Union, of which, unlike his father, he was to the last an ardent opponent.

See Edward Wakefield, *An Account of Ireland* (1812); *Correspondence of the Right Hon. John Beresford*, ed. W. Beresford (1854); Earl Stanhope, *Life of William Pitt* (1861); W. E. H. Lecky, *History of Ireland in the Eighteenth Century*, vols. iii., iv., v. (1892).

BERESFORD, WILLIAM CARR BERESFORD, Viscount (1768-1854), British general and Portuguese marshal, illegitimate son of the first marquis of Waterford, was born on Oct. 2 1768. He entered the British army in 1785, and while in Nova Scotia with his regiment in the following year lost the sight of one eye by a shooting accident. He first distinguished himself at Toulon in 1793, receiving two years later the command of the 88th regiment (Connaught Rangers). He made his reputation under Sir David Baird in Egypt (1799-1803) and South Africa (1805). From South Africa he was despatched to South America. He had little difficulty in capturing Buenos Aires with only a couple of regiments. But this force was wholly insufficient to hold the colony. Under the leadership of a French *émigré*, the chevalier de Tiniers, the colonists attacked Beresford, and at the end of three days' hard fighting he was compelled to capitulate. After six months' imprisonment he escaped, and reached England in 1807, and at the end of that year he was sent to Madeira, occupying the island in the name of the king of Portugal. After six months in Madeira as governor and commander-in-chief, he was ordered to join Sir Arthur Wellesley's army in Portugal. He was first employed as commandant in Lisbon, but accompanied Sir John Moore on the advance into Spain, and took a conspicuous part in the battle of Corunna (*see* PENINSULAR WAR). In Feb. 1809 Beresford was given the task of reorganizing the Portuguese army. In this task, by systematic weeding-out of inefficient officers and men, he succeeded beyond expectation. By the summer of 1810 he had so far improved the *morale* and discipline of the force that Wellington brigaded some of the Portuguese regiments with English ones, and at Busaco Portuguese and English fought side by side.

In the spring of 1811 Wellington was compelled to detach Beresford from the Portuguese service. The latter was next in seniority to Gen. (Lord) Hill, who had gone home on sick leave, and on him, therefore, the command of Hill's corps now devolved. Unfortunately Beresford never really gained the confidence of his new troops. At Campo Mayor his light cavalry brigade got out of hand, and a regiment of dragoons was practically annihilated. He invested Badajoz with insufficient forces, and on the advance of Soult he was compelled to raise the siege and offer battle at Albuera. His personal courage was even more than usually conspicuous, but to the initiative of a junior staff officer, Col. (afterwards Viscount) Hardinge, rather than to Beresford's own generalship, was the hardly won victory to be attributed. Beresford then went back to his work of reorganizing the Portuguese army. He was present at the siege of Badajoz and at the battle of Salamanca, where he was severely wounded (1812). In 1813 he was

present at the battle of Vitoria and at the battles of the Pyrenees, while at the battle of the Nivelle, the Nive and Orthez he commanded the British centre, and later he led a corps at the battle of Toulouse. At the close of the Peninsular War he was created Baron Beresford of Albuera and Cappoquin, with a pension of £2,000 a year, to be continued to his two successors.

In 1819 the revolution in Portugal led to the dismissal of the British officers in the Portuguese service. In 1823 Beresford's barony was made a viscounty, and when the duke of Wellington formed his first cabinet in 1828 he gave Beresford the office of master-general of the ordnance. In 1830 Beresford retired from politics, and for some time was occupied in a heated controversy with William Napier, the historian of the Peninsular War, who had severely criticized his tactics at Albuera. On this subject Wellington's opinion of Beresford is to the point. The duke had no illusions as to his being a great general, but he thought very highly of his powers of organization, and he went so far as to declare, during the Peninsular War, that, in the event of his own death, he would on this ground recommend Beresford to succeed him. The last years of Beresford's life were spent at Bedgebury, Kent. He died on Jan. 8 1854.

BEREZINA, a river in the White Russian S.S.R., a tributary of the Dnieper. It rises in the marshes of Borizov and flows south for 350m. (250m. navigable), for the most part through low-lying but well-wooded country. It is linked with the Black sea and the Baltic, and is important for commerce, but is subject to severe floods. It was just above Borizov that Napoleon's army forced the passage of the Berezina, with enormous losses, on Nov. 26–28, 1812, during the retreat from Moscow.

BEREZOV, a town in the Uralsk area of the Russian Socialist Federal Soviet Republic on the left bank of the Sosva river, 26m. above its junction with the Ob river. Lat. 63° 52' N, Long. 64° 54' E. Pop. (1926) 4,706. Alt. 100ft. Average rainfall per annum 18.4in. Av. temp. Jan. 10.7° F, July 61.3° F. As early as 1593 the Cossacks had established a trading post for furs (fox, ermine, squirrel, bear, reindeer, hares and sable) and this trade, except in sable, now goes on, together with dried and salted fish. It was burnt down in 1719 and 1808. It was a place to which political exiles were sent. among them were Prince Menshikov, the favourite of Peter the Great and Catherine I., who died here 1729, his enemy Prince Dolgoruki and his family, exiled 1730, and Mary Menshikov, once betrothed to Peter II.

BEREZOVSK, a mining centre in the Sverdlovsk district of the Uralsk area, Russian S.F.S.R., 8m. N.E. of Sverdlovsk (formerly Ekaterinburg). Pop. (1926) 8,032. The gold mines have been worked here since 1747. It has koustar (peasant) leather and wooden industries.

BERG (*Ducatus Montensis*), a former duchy of Germany, on the right bank of the Rhine, bounded on the north by the duchy of Cleves, on the east by the countship of La Marck and the duchy of Westphalia, and south and west by the bishopric of Cologne. Its area was about 1,120sq.m. The district was raised in 1108 to the rank of a countship, but did not become a duchy till 1380, after it had passed into the possession of the Julich family. In 1423 the duchy of Julich fell to Adolf of Berg, and in 1437 the countship of Ravensberg was united to the duchies. The male line of the dukes of Julich-Berg-Ravensberg became extinct in 1511, and the duchy passed by marriage to John III. (d. 1539), duke of Cleves and count of La Marck, whose male line became extinct with the death of John William, bishop of Munster, in 1609. The question of succession led to a prolonged contest, which was one of the causes of the Thirty Years' War. It was settled in 1614 by a partition.

Berg was bestowed by Napoleon on Joachim Murat, who bore the title of grand-duke of Berg. The Congress of Vienna awarded it to Prussia.

BIBLIOGRAPHY.—R. Gocke, *Das Grossherzogtum Berg unter Joachim Murat Napoleon I. und Louis Napoleon, 1806–13* (Cologne, 1877); Stokvis, *Manuel d'histoire, etc.*, vol. iii. (Leyden, 1890–93); B. Schöneschöfer, *Geschichte des Bergischen Landes* (Elberfeld, 1895).

BERGAMASK or **BERGOMASK** (from the town of Bergamo in North Italy), a clumsy rustic dance (cf. Shakespeare,

Midsummer Night's Dream, v. 360) copied from the natives of Bergamo, reputed to be very awkward in their manners. (See DANCE.)

BERGAMO, an episcopal see in Lombardy, Italy (ancient *Bergomum*), capital of the province of Bergamo, at the foot of the Alps, at the junction of the Brembo and the Serio, 33½m. N.E. of Milan by rail. Pop. (1921) town, 58,537; commune, 71,366. The older Città Alta, on a hill (1,200ft.), strongly fortified by the Venetians, is linked by funicular railway to the newer Città Bassa below. The fine Romanesque church of S. Maria Maggiore (1137–1355) has a baroque interior and interesting works of art. The Cappella Colleoni, has a richly sculptured polychrome façade, and fine tombs of Bartolommeo Colleoni and his daughter Medea, executed (1470–1476) by Giovanni Antonio Amadeo, who also worked at the Certosa di Pavia. The adjacent market-place (now Piazza Garibaldi) contains the Gothic Palazzo Vecchio or Broletto; close by is a small baptistery of 1340, rebuilt in 1898. The lower town contains an important picture-gallery of north Italian masters. The musician Gaetano Donizetti was born here. Bergamo and the surrounding district have numerous cotton, silk, linen, wool, blanket and button factories. Railways radiate to Lecco, Ponte della Selva, Usmate (for Monza or Seregno), Treviglio (on the main line from Milan to Verona and Venice), and (via Rovato) to Brescia, and steam tramways to Treviglio, Sarnico and Soncino. The ancient Bergomum was the tribal centre of the Orobii; it became a Roman municipality and after destruction by Attila, was the capital of a Lombard duchy. From 1264 to 1428 it was under Milan, but then became Venetian, and remained so until 1797. (See P. Pesenti, *Bergamo*, 1910.)

BERGAMOT, OIL OF, an essential oil obtained from the rind of the fruit of the *Citrus bergamia*. The bergamot tree is small, with leaves and flowers like those of the bitter orange, and a round fruit nearly 3in. in diameter, having a thin, lemon-yellow, smooth rind. The tree is cultivated in southern Calabria, whence the entire supply of bergamot oil is drawn. Machinery is mostly used to express the oil from the fruit, which is gathered in November and December. The oil, which on standing deposits a stearoptene, bergamot camphor or bergaptene, is a limpid greenish-yellow fluid of a specific gravity of 0.882 to 0.886, and its powerful but pleasant odour is mainly due to the presence of linalyl acetate, or *bergamiol*, which can be prepared artificially by heating linalol with acetic anhydride. The chief use of bergamot oil is in perfumery. The word apparently is derived from the Italian town Bergamo. The name Bergamot, for a variety of pear, is supposed to be a corruption of the Turkish *beg-armudi* (prince's pear).

BERGDAMA, a Negro people inhabiting the northern half of south-west Africa, calling themselves *ʔnukhoim* ("black people"). Their original language is unknown, for they all now speak the language of the Nama Hottentots, to whom they have long been subject. Some of them keep sheep and goats, and cultivate various crops, but the majority still lead a hunting and collecting life. They are divided into small patriarchal groups which are politically independent of one another. They worship a supreme being known as *||gamab*, and an important part is played in their domestic cult by the sacred fire.

See H. Vedder, *Die Bergdama* (1923).

BERGEDORF, a town of Germany, in the territory of Hamburg, on the river Bille, 10m. S.E. of Hamburg. Pop. (1925) 18,320. It produces vegetables and fruit for the Hamburg markets, and has manufactures of glass, asbestos and enamel. It received civic rights in 1275, belonged to Lübeck and Hamburg conjointly from 1420 to 1868, and in the latter year was purchased by Hamburg.

BERGEN, city and seaport, west Norway, in lat. 60° 23' N, forming a separate county (*amt*). Pop. (1920) 91,443. It is beautifully situated on the broad Byfjord, and partly on a promontory between the excellent harbour (Vaagen) and the Puddefjord. The two Lungegaard lakes isolate the site landwards, and are surrounded by parks which form the pleasure-ground of Bergen. From the fjord the city rises in an amphitheatre, with the houses, of wood or stucco, painted in reds and yellows. The settlement

(formerly Björgvin), founded by King Olaf in 1070-1075, grew rapidly and figured prominently in the subsequent civil wars. The Hansa merchants increased the prosperity of the town from 1445 to 1558. They maintained a position, indeed, until 1764, inhabiting the German quarter (Tydskenbryggen). Their carefully preserved store-house (*gaard*) is now occupied by the "Hanseatic Museum." The broad open spaces (*Almenninge*) so characteristic of Bergen and other Norwegian towns are intended as a safeguard against fire. Disastrous fires occurred in 1702, 1855 and 1916. Since 1916 the central part of the town has been replanned, and a new road built from the old German quay, where the ancient warehouses and dark courts are disappearing. A garden suburb has also been laid out at Finbergaasen.

The cathedral of Bergen was rebuilt in the 16th century. The Romanesque nave of *Mariae Kirke* is the most noteworthy example of early architecture; the prevailing poverty in this respect is to be ascribed to the general use of wood for building purposes. The Vestlandske fishery and industrial museum is of interest, while the Bergen museum has archaeological and natural history collections. The Art Gallery contains the Rasmus Meyer collection of Norwegian paintings and furniture. Among distinguished natives Ole Bull and Edvard Grieg should be mentioned. The port has extensive quays and several engineering works, with ship-building yards attached. There are six patent slips and three dry docks. The trade is second only to that of Oslo. Net tonnage (1925) 1,174,754. The staple export is fish and fish products; also butter, copper ore and hides. Principal imports: coal, machinery, grain and provisions. Industries include weaving and distilling, with manufactures of paper, pottery, tobacco and ropes. The fishing-smacks and timber-ships of the harbour give it a picturesque aspect; it is fronted by the *Torv* or market-place. The Bergenhus and Fredriksberg forts are placed at the north and south entries of the harbour respectively. The Sverresborg is another old fort. Bergen is an important centre of the extensive tourist traffic of Norway.

BERGEN-OP-ZOOM, a town in the province of North Brabant, Holland, on both sides of the small river Zoom, near its confluence with the east Scheldt, 38½ m. by rail E. by N. of Flushing. It communicates with Antwerp (20 m. S.) and with the islands of Tholen and Duiveland to the north-west. Pop. (1927) 20,930. It is an old town. It was taken by the Normans in 880. In the 13th century Count Gerhard of Wesemael surrounded it with walls and built a castle. In the 15th century it prospered greatly through its fisheries and its cloth-trade. In 1576 the town joined the United Netherlands, and was fortified. In 1588 it was successfully defended against the duke of Parma, and in 1605 was suddenly attacked by Du Terrail. In 1622 the Spaniards again failed to take the town. In the 17th century the fortifications were strengthened by Coehoorn, and in 1725 further extended. In 1747 the town was taken by the French, under Löwendahl. Restored at the end of the war, it was again taken by the French under Pichegru in 1795. The English failed to take it from the French, who surrendered the place later by the treaty of peace.

The lordship of Bergen-op-Zoom after the union of the Low Countries with the Empire in 924, was an hereditary fief of the Empire, and the succession of its lords may be traced from Henry (1098-1125), who also held Breda. In 1533 it was raised to a margraviate by Charles V., and was held by various families until in 1799 it passed to the royal house of Bavaria, by whom it was renounced in favour of the Batavian republic in 1801. Bergen-op-Zoom has a town hall and an academy of design and architecture. The remains of the castle of the margraves has been converted into barracks. A considerable trade is carried on in anchovies and oysters caught in the Scheldt as well as a large sugar-beet industry.

BERGERAC, town of France, capital of an arrondissement in the department of Dordogne, on the right bank of the river Dordogne 60 m. E. of Bordeaux on the railway to Cahors. Pop. (1926) 11,751. The site commands one of the important valleys opening out from the Plateau Central on to Bordeaux. The river is made navigable to this point by means of a large dam. On the edge of the difficult plateau country, Bergerac early

embraced Protestantism and suffered severely from religious wars, and from the revocation of the Edict of Nantes (1685). Wine of fine quality is grown in the district and is sent to Libourne and Bordeaux for export. There is trade in grain, brandy and salmon of the Dordogne; and chestnuts are largely exported to England. Bergerac is the seat of a sub-prefect and has tribunals of first instance and of commerce. Its fortifications were destroyed in 1621.

BERGHAUS, HEINRICH (1797-1884), German geographer, was born at Kleve on May 3, 1797, and joined the staff of the Prussian trigonometrical survey in 1816. He carried on a geographical school at Potsdam in company with Heinrich Lange, August Petermann, and others, and long held the professorship of applied mathematics at the Bauakademie. His greatest achievement was the *Physikalischer Atlas* (Gotha, 1838-48), in which work, as in others, his nephew HERMANN BERGHAUS (1828-90) was associated with him. He also had a share in the reissue of the great *Stieler Handatlas* (produced by Adolf Stieler in 1817-23), and in the production of other atlases. His written works included *Allgemeine Länder- und Völkerkunde* (Stuttgart, 1837-40), *Grundriss der Geographie in fünf Büchern* (1842), *Die Völker des Erdballs* (Leipzig, 1845-47), *Was man von der Erde weiss* (1856-60), and various large works on Germany. In 1863 he published *Briefwechsel mit Alexander von Humboldt* (Leipzig). He died at Stettin on Feb. 17, 1884.

BERGISCH GLADBACH, a town in Rhenish Prussia, 8 m. N.E. of Cologne. Pop. (1925), 18,140. It is finely situated and is a resort as well as a business centre. The manufactures include paper, wire-netting, fireclay and lime.

BERGIUS, FRIEDRICH (1884-), German chemist, was born Nov. 11, 1884, at Goldschmieden near Breslau. He studied at the universities of Breslau, Leipzig, and Berlin and at the technical schools in Karlsruhe and Hanover. Later he founded a private technical research laboratory in Hanover and devoted himself chiefly to the study of the influence of high pressure on chemical actions. This is described in his book *The Use of High Pressure in Chemical Actions* (1913). These studies led up to his work in connection with the conversion of coal into liquid products. Through the action of hydrogen under high pressure and at high temperature, he succeeded in converting a high percentage of coal-dust into oil direct, without first obtaining intermediate products. The oil is equivalent in value to crude mineral oil. An experiment plant was erected at Rheinau near Mannheim.

BERGK, THEODOR (1812-1881), German philologist, was born at Leipzig. After studying there under G. Hermann, and holding posts at Halle, Neustrelitz, Berlin and Cassel, he succeeded K. F. Hermann as professor of classical literature at Marburg (1842). In 1852 he went to Freiburg, and in 1857 returned to Halle. In 1868 he resigned his professorship, and settled down to study and literary work in Bonn. Bergk's literary activity was very great, but his reputation mainly rests upon his work in connection with Greek literature and the Greek lyric poets. His *Poetae Lyrici Graeci* (1843, 5th ed. 1900, etc.), and *Griechische Literaturgeschichte* (1872-87), completed by G. Hinrichs and R. Peppmüller are standard works. He also edited Anacreon (1834), the fragments of Aristophanes (1840), Aristophanes (3rd ed., 1872), Sophocles (2nd ed., 1868), a lyric anthology (4th ed. 1890, re-ed. E. Diehl 1923). Among his other works may be mentioned: *Augusti Rerum a se gestarum Index* (1873); *Inscriptionen römischer Schlendergeschosse* (1876); *Zur Geschichte und Topographie der Rheinlande in römischer Zeit* (1882); *Beiträge zur römischen Chronologie* (1884). His *Kleine philologische Schriften* have been edited by Peppmüller (1884-86), and contain, in addition to a complete list of his writings, a sketch of his life.

See Sandys, *Hist. of Class. Schol.* iii. 146 (1908).

BERGLER, STEPHAN (c. 1680-c. 1740), German classical scholar, was born at Kronstadt in Transylvania and died at Bucharest. After studying at Leipzig, he went to Amsterdam, where he edited Homer and produced indices to the *Onomasticon* of Julius Pollux for Wetzstein the publisher. Subsequently, at Hamburg, he assisted Fabricius (q.v.) in the production of his *Bibliotheca*

Graeca and his edition of Sextus Empiricus. He became secretary to the prince of Wallachia, in whose library he discovered the introduction and the first three chapters of Eusebius's *Demonstratio Evangelica*. In addition to writing numerous articles for the Leipzig *Acta Eruditorum*, Bergler edited the *editio princeps* of the Byzantine historiographer Genesis (1733); the letters of Alciphron (1715), including 75 hitherto unpublished, and Aristophanes (published by Burman 1760). He also translated Herodian into Latin (1759).

BERGMAN, TORBERN OLOF (1735–1784), Swedish chemist and naturalist, was born at Katrineberg, Vestergötland, Sweden, on March 20, 1735. He was educated at the University of Uppsala, and, after taking his degree, began to teach mathematics and physics at the university, publishing papers on the rainbow, the aurora, the pyroelectric phenomena of tourmaline, etc. In 1767 he became professor of chemistry and mineralogy. He died at Medevi on Lake Vetter on July 8, 1784. Bergman's most important chemical paper is his *Essay of Elective Attractions* (1775), a study of chemical affinity. In methods of chemical analysis, both by the blowpipe and in the wet way, he effected many improvements and made considerable contributions to mineralogical and geological chemistry, and to crystallography. He also made observations of the transit of Venus in 1761, and published a *Physical Description of the Earth* in 1766.

His works were collected and printed in 6 vols. as *Opuscula Physica et Chemica* in 1779–90, and were translated into French, German and English.

BERGMANN, ERNST VON (1836–1907), a German surgeon of Russian birth, was born at Riga on Dec. 16, 1836, and educated at Dorpat, where he was professor of surgery from 1871 to 1878. In 1878 he removed to the University of Würzburg, and in 1882 succeeded Langenbeck at Berlin. He had seen army service in the Prussian army in 1866 and 1870–71, and in the Russian army in 1877–78, and was one of the greatest surgeons of his time. In 1886 he introduced steam sterilization and in 1891 began to use aseptic methods. His principal contributions are in cranial surgery, on which his work *Die chirurgische Behandlung der Hirnkrankheiten* (1888; 3rd ed. 1899) is a classic.

See A. Buchholz, *Ernst von Bergmann* (Leipzig, 1911).

BERGSCHRUND, a gaping crack in the upper part of a snowfield or a glacier. It is near the rock wall and roughly parallel to the rock-face of the upper edge of the glacier basin. It usually extends downwards to the solid rock beneath the glacier, and at the bottom of the huge crevasse thus formed there are blocks of ice and large pieces of rock from the rock wall and from the floor. It is caused by the snow mass moving bodily away from the rock face either when being compacted by its own weight or when moving down hill as a glacier.

BERGSON, HENRI (1859–), French philosopher, was born Oct. 18 1859, in Paris, of Anglo-Jewish parents. After a brilliant career at the Lycée Condorcet, he hesitated for some time between literature and science. He became naturalized as a Frenchman, and entered the École Normale Supérieure, where he was the contemporary of Jaurès. He taught philosophy first at the Lycées of Angers and Clermont, and then in Paris at the Lycée Henri IV., the École Normale Supérieure and the Collège de France. In 1918 he succeeded Émile Ollivier at the Académie Française. From that time he gave up teaching and devoted himself to politics and to international affairs, as head of a mission to America, and after the World War as president of the committee of intellectual co-operation. In 1928, he was awarded the Nobel Prize for Literature for 1927.

Bergson's Philosophy.—An account of the appointments held by him is, however, of small importance as compared with the development of his mind, revealed in the books which have gained him a world reputation. He is one of the most highly esteemed of contemporary students of philosophy. Bergson the philosopher is not, like Hegel, Schopenhauer and Spencer, the creator of a great system, conceived as a whole in youth, and gradually expressed in later life. There is, nevertheless, in his philosophy one outstanding idea which is said to have come to him during a walk at Clermont-Ferrand, when he was 25 years

old. Since Plato, philosophy had consisted in eliminating duration, in regarding time as an illusion and finite being and eternity as one, and Bergson asked himself whether, on the contrary, the being, of which the philosopher took cognizance by reflection, might not be one which endured, might not be time itself. For the phrase of Descartes, "Je suis une chose qui pense," he substituted "Je suis une chose qui dure," and for the *sub specie aeternitatis* of Spinoza, a *sub specie durationis*. As he substituted durational for non-temporal values, so for static values he substituted values of motion and change. This was the true Bergsonian revolution, which may be related to the German and English historical and evolutionary philosophies characteristic of the 19th century.

All Bergson's work is thus concerned with duration and movement. He does not proceed by general speculation. Each of his books is a study of one particular question, and this illustrates his second characteristic, originality of method. In his opinion, philosophy, like science, can only progress by disregarding general theories and universal systems, and devoting attention to particular problems, each of which demands its own point of view. The solution of any one of these does not necessarily involve an analogous solution of the others. Bergsonism implies continued striving after a precise adaptation to reality. The aim of each of his works is the elucidation of a detailed problem, though each is also part of a general philosophy, the philosophy of duration and change. For him, the true nature of things is apprehended by intuition, but those who only recognize the scientific interpretation offered by the intelligence discover in Bergsonism an apotheosis of intuition and of mystical values and a depreciation of intelligence, mistaking the true substance of his theories.

The *Essai sur les données immédiates de la conscience* (1889), which was Bergson's thesis for the doctorate, is primarily an attempt to establish durational values, where the necessary illusions of the mind situate the appearances of space, and thence to proceed towards an original solution of the problem of free will which was at that time the principal occupation of French philosophers. *Matière et mémoire* (1896) contains a detailed consideration of the problem of aphasia leading to a profound study of the means, namely, the memory, by which existence is made continuous. In *L'évolution créatrice* (1907) he studies the whole problem of existence. Whilst Spencer merely supported evolution by evidence derived from fragments of the evolved, Bergson takes as his material the essential motion of the being changing, or rather of the being which is itself both change and movement. This is his most famous and influential work, and that which has most fully expressed his ideas as to the secret of the universe.

An important part of Bergson's philosophy is to be found in his minor works, such as the essay *Le rire* (1900), his lectures at Oxford entitled *La perception du changement* (1911) and the volume *Durée et simultanéité* (1922), in which he discusses Einstein's theories. Except for the articles which have been collected under the title *L'énergie spirituelle* (1919) he has published nothing of late years, though he has been engaged in the study of moral and religious problems.

His lectures at the Collège de France were models of clearness and grace of expression and enjoyed great popularity. It was, however, probably as a master at the Lycée Henri IV that his influence was most strongly felt. His style is modelled on that of the great philosophers, restrained and concise, like that of Condillac and at the same time full of colour and imagery, like that of Plato and Bacon. (See PHILOSOPHY) (A. T.)

BERGUES, town of France, department of Nord, at the junction of the Colme canal with those of Dunkirk and Furnes (in Belgium), 5m. S.S.E. of Dunkirk by rail. Pop (1926) 3,705. The town has a fine 16th century belfry restored in the 19th century. The church of St. Martin is a Gothic brick building of the 17th century with a modern façade. The town hall (19th century), contains a municipal library and an interesting collection of pictures.

BERHAMPORE, a town of British India, the headquarters of Murshidabad district, in Bengal, situated on the left bank of

the river Bhagirathi, 6m. below Murshidabad city. Pop. (1921) 26,670. Berhampore was fixed upon after the battle of Plassey as the site of the chief military station for Bengal; and a huge square of barracks was erected in 1767. Here was committed the first overt act of the mutiny of 1857. No troops are now stationed here, and the barracks have been utilized for civil purposes. The town contains a college. In the municipality of Berhampore is included the remnant of the once important, but now decayed, city of Cossimbazar (*q v.*).

BERHAMPUR, a town of British India, in the presidency of Madras. Pop. (1921) 32,731. It is the headquarters of Ganjam district, and is situated about 9m. from the sea. It is a station on the East Coast railway, which connects Calcutta with Madras. The military cantonment was transferred elsewhere in 1906. There is some weaving of silk cloth, rice mills and a tannery, and export trade in sugar. The town contains Kallikota college, an industrial school and the Jubilee hospital. The college, originally founded by the Government, is now maintained by the rajah of Kallikota.

BERI-BERI, so called from the Sinhalese word meaning weakness, is a disease that for a long time was a heavy handicap to tropic and semi-tropic enterprise. It was endemic in India, Malaya, China, Japan, the Philippines, and South America. Isolated cases occurred on the high seas and were known even in Dublin. Its symptoms are neuritic and polyneuritic: inanition, gastric irritation, emaciation, swelling of legs, chest, and face, burning pains, muscular wastage, paralysis, disturbance of the heart's action. It was at one time believed to be due to malarial poisoning or infection, but no bacillus could be discovered. In the year 1890, from careful observation of native habits and movements in Sarawak, Dr. Charles Hose became convinced that it had a connection with diet. Though every effort to locate some micro-organism failed, the more closely the problem was studied the more certain it appeared that this hypothesis was right. A new stage in the attempt to unravel the mystery was reached when it was found that men working many months in the forest or on plantations far away from home and eating imported polished rice went down with the disease, whilst their women folk and others at home, living on their own freshly-husked supplies, were immune. The idea that weevils or mould might be responsible naturally suggested itself. That, however, was difficult to reconcile with the fact that outbreaks were usually worse at the very season when importations were freshest. But the association was established by the recovery of the sufferers when their diet was changed from the imported to the home-grown newly-husked rice. Experiments on monkeys and fowls with imported polished rice resulted in all the symptoms of beri-beri and recovery when the native article was substituted. During the '90s, Capt. E. R. Rost of the Indian Medical Service, studying the problem in Burmah, suspected the existence of a germ which he said he found in rice and Jowari grain, and Mr. John Foreman, in his account of the Philippines then just taken over from Spain by the United States, noted that many deaths occurred from "acute indigestion due to eating too plentifully of new rice" and that many who recovered from cholera "became victims of a disease known as beri-beri." In various directions, therefore, the trouble was more or less directly traced to diet. When home on furlough in 1899 Dr. Hose submitted a paper to Mr. Strangeways, demonstrator of pathology at Cambridge—an abstract of which appeared in the *Medical Review*, June 1901—and in 1905 again in the laboratories at Cambridge, with the encouragement of Dr. Duckworth and others, he pursued researches which still seemed to point to the weevil or fermentation as the cause. These researches were laid before the British Medical Association meeting at Leicester in the latter year. Controversy as to the etiology of the disease grew in interest. It occupied the attention of the London and Liverpool schools of tropical medicine. In 1909 and 1911, however, Drs. Henry Fraser and A. T. Stanton in *Etiology of Beri-beri* (studies from the Institute of Medical Research, Federated Malay States) explained how investigations made by De Haan, Chamberlain, and Eijkmann had shown that a substance so minute that there are only ten grains in a ton of rice was absent

from the milled and polished article. That particle Dr. Casimir Funk, of the Lister Institute, isolated and called vitamin. So the food theory prevailed, and the conclusion was recorded in Manson's *Tropical Diseases*: "We now know that beri-beri is a sequel of a diet into which enters, as the principal element . . . rice from which the entire pericarp and germ have been removed, and that in this pericarp and germ there is a substance essential to the proper nutrition of the nervous system of man and of many other warm-blooded vertebrates."

But the last word has not yet been said on the subject, as may be gathered from (1) the experience of the Americans in the Philippines (from which in 1911 President Taft said the disease had been almost eliminated by the substitution of unpolished for polished rice), for a recent American visitor (Katherine Mayo: *The Isles of Fear; the Truth about the Philippines*, 1925) reports that it has again become a scourge as the result of the inefficient Filipino medical work, (2) the account of beri-beri outbreaks in Singapore given by Dr. G. E. Brooke so late as 1919 (*One Hundred Years of Singapore*), when he said that "the remarkable periodicity, with maxima about every four years, pointed more towards a bacterial origin than to a deficiency in vitamins," though he admitted that experience had proved that "ordinary polished rice has some connection (probably bacterial) with the disease," and (3) Dr. H. H. Woollard (*Journal of Anatomy*, April 1927, on *The Nature of the Structural Changes in Nerve Endings in Starvation and Beri-beri*) says there are several points relating to the pathology of the disease that have not been adequately decided. "Most authors who have considered the relation of beri-beri to inanition record their opinion that inanition alone does not produce beri-beri. In this inability to reproduce the disease by starvation alone those who see a close parallel between beri-beri and the various forms of toxic neuritis find their best ground for believing that beri-beri is a similar disease." From an examination of the literature of the subject he says: "It is obvious that the findings in the beri-beri animal present a close parallel with the changes that occur in an animal that is deprived of all food. . . . It is true that, save for Eijkmann, observers are accustomed to confirm the idea that the polyneuritis is peculiar to beri-beri. The experimental cases are not comparable to what occurs in the chronic cases in man, as presumably there the time allows of far-reaching degeneration of the nerves." This seems to show that, the origin of the disease having been settled, early treatment by restoration of the necessary vitamins to the food reduces the possibility of complication to a minimum. Is, then, the vitamin, if administered in time, an antitoxin or is it merely a stimulant?

BERING, VITUS JONASSEN (1681–1741) Danish navigator, was born at Horsens, Jutland, in 1681, and died on Bering island, Dec. 1741. Joining the Danish navy early, he went in 1703, on a voyage to the East Indies; the following year he entered the Russian navy, and served in the war against Sweden. In 1724 Peter the Great appointed Bering to conduct an expedition to north-eastern Siberia, with the object of discovering whether Asia and America were divided. This expedition set forth from St. Petersburg (Leningrad) on Feb. 5, 1725, after the death of Peter, and proceeding by land across Siberia to Kamchatka, built ships and sailed on July 14, 1728, from the mouth of the Kamchatka river along the north-eastern coast of Siberia as far as 67°N. Deciding that Asia and America were not connected and that it would be inadvisable to sail further north,

Bering turned back, and returning by the way he came, arrived in St. Petersburg again in March 1730. But the result of his journey was considered unsatisfactory, and he persuaded the Empress Catherine to send him on a second expedition in 1733. The members of this party arrived in detachments at Okhotsk, confusion and quarrels among the officers and obstructive policy of the local authorities in Siberia delayed matters, and it was not until 1740 that the two boats, the "St. Peter" and the "St. Paul" left Okhotsk, reaching Petropavlovsk on Oct. 6. From this harbour they sailed on June 4, 1741, Bering in the "St. Peter" and his lieutenant, Chirikov in the "St. Paul." The two ships soon separated, and Bering sailed south-east, in search of Gamaland, which he failed to find, and almost parallel to the Aleutian islands without knowing it. Soon after sighting the volcano of St. Elias in Alaska, he landed on an island afterwards named St. Elias, thus discovering America from the east. On the return voyage Bering was taken ill, the ship lost her bearings in a fog, and the expedition was obliged to spend six months on an uninhabited island, afterwards called Bering island, near Kamchatka, where Bering died in December, a month after they had landed.

See P. Lauridsen, *Russian Explorations, 1725-1743. Vitus Bering: the Discoverer of Bering Strait*, trans. by J. E. Olson (Chicago, 1889); F. A. Golder, *Bering's Voyages* (bib.) pub. by the Amer. Geog. Assoc. (1922, 1925).

BERING ISLAND, SEA AND STRAIT. These are named after the explorer Vitus Bering. The island (also called Avatcha), which was the scene of his death, lies in the southwestern part of the sea, off the coast of Kamchatka, being one of the Commander or Komandor group, belonging to Siberia. It is 69m. long and 28m. in extreme breadth, the area is 615 sq. miles. The extreme elevation is about 300 feet. The smaller Copper island lies near. The islands are treeless; the population is about 650. Bering sea continues the Pacific ocean northwards and is demarcated from it by the Aleutian islands. It is bounded on the east by Alaska, and on the west by the Siberian and Kamchatkan coast. Its area is about 886,000 sq. miles. In the north and east it has numerous islands (St. Lawrence, St. Matthew, Nuni-vak and the Pribiloff group) and is shallow; in the south-west it reaches depths of 2,150 fathoms at least. The seal-fisheries are important (see **BERING SEA ARBITRATION**). The sea connects with the Arctic Ocean by Bering strait, at the narrowest part of which East cape (Deshnev) in Asia approaches within about 56m. of Cape Prince of Wales on the American shore, and is here 24 fathoms deep. North and south of these points the coasts on both sides rapidly diverge. The strait contains two small islands known as the Diomedes islands. These granite domes, lacking a harbour, lie over a mile apart, and the boundary line between the possessions of Russia and the United States passes between them. They are occupied by about 80 Eskimos, who from early times have been middlemen between Asia and America. They call the western island Nunárbook and the eastern Ignálook.

The climate is severe. From November to May the temperature of the air is below 32° and in summer it hardly surpasses 46·5°; in winter indeed it is sometimes well below zero. The ice found in this sea is usually of local origin and not derived from the Polar basin; it develops mostly on the coasts and in shallow waters. The ice limit usually runs from the Eastern Aleutian Islands past St. Paul northward to latitude 60° N, thence following the coast of Kamchatka southward. As a result of this the areas of the greatest depths remain ice-free. In July, August and September the ice limit usually retreats north of the Bering Strait, because south winds drive a strong current with rather warmer water from the Pacific northwards. This current was much used by the whale fishers of the 19th century and is also taken advantage of by Polar expeditions, in order to reach the north coast of North America.

Isai Ignatiev went east from the Kolyma river in 1646, and Simon Dezhnev in 1648 followed his route and prolonged it, rounding the East or Dezhnev cape, and entering the strait. The post of Anadyrsk was founded on the river Anadyr, and an overland way gradually opened up. A Russian named Popov first learnt a rumour of the existence of islands east of Cape Dezhnev,

and of the proximity of America, and presently there followed the explorations of Vitus Bering. In 1731 the navigator Michael Gvosdev was driven by storm and followed the Alaskan coast for two days. Under Bering on his last voyage (1741) was Commander Chirikov of the "St. Paul" who explored the Alaskan coast. Lieutenant Waxel and William Steller, a naturalist, left at the head of Bering's party after his death, founded the important fur trade of these waters. Michael Novodiskov (1745) and his successors continued it. Captain James Cook, working from the south, explored the sea and strait in 1778.

BERING SEA ARBITRATION. The important seal fishery dispute between Great Britain and the United States, which was closed by this arbitration, arose in the following circumstances. In 1867 the U.S. Government had purchased from Russia all her territorial rights in Alaska and the adjacent islands. The boundary between the two powers, as laid down by the treaty for purchase, was a line drawn from the middle of Bering strait south-west to a point midway between the Aleutian and Komandorski islands dividing Bering sea into two parts, of which the larger was on the American side of this line. This portion included the Pribiloff islands, which are the principal breeding-grounds of the seals frequenting those seas. By certain acts of Congress, passed between 1868 and 1873, the killing of seals was prohibited upon the islands of the Pribiloff group and in "the waters adjacent thereto" except upon certain specified conditions. No definition of the meaning of the words "adjacent waters" was given in the act. As early as 1872 the operations of foreign sealers attracted the attention of the U.S. Government, but any precautions then taken seem to have been directed against the capture of seals on their way through the passages between the Aleutian islands, and no claim to jurisdiction beyond the three-mile limit appears to have been put forward. On March 12, 1881, however, the acting secretary of the United States treasury, in answer to a letter asking for an interpretation of the words "waters adjacent thereto" in the acts of 1868 and 1873, stated that all the waters east of the boundary line were considered to be within the waters of Alaska territory. In March 1886 this letter was communicated to the San Francisco customs by the secretary of the treasury, for publication. In the same summer three British sealers, the "Carolena," "Onward" and "Thornton," were captured by an American revenue cutter 60 m. from land. They were condemned by the district judge on the express ground that they had been sealing within the limits of Alaska territory. Diplomatic representations followed, and an order for release was issued, but in 1887 further captures were made and were judicially supported upon the same grounds.

The Conflicting Claims.—The respective positions taken up by the two Governments in the controversy which ensued may be thus indicated. The United States claimed as a matter of right an exclusive jurisdiction over the sealing industry in Bering sea; they also contended that the protection of the fur seal was, upon grounds both of morality and interest, an international duty, and should be secured by international arrangement. The British Government repudiated the claim of right, but were willing to negotiate upon the question of international regulation. Between 1887 and 1890 negotiations were carried on between Russia, Great Britain and the United States with a view to a joint convention. Unfortunately the parties were unable to agree as to the principles upon which regulation should be based. The negotiations were wrecked upon the question of pelagic sealing. Inasmuch as the seal nurseries were upon islands belonging either to the United States or Russia, the prohibition of pelagic sealing would have excluded Canada from the industry. The United States, nevertheless, insisted that such prohibition was indispensable on the grounds—(1) that pelagic sealing involved the destruction of females necessary for breeding stock; (2) that it was unnecessarily wasteful, inasmuch as a large proportion of the seals so killed were lost. On the other hand, it was contended by Great Britain

that in all known cases the extermination of seals had been the result of operations upon land, and had never been caused by sealing exclusively pelagic. The negotiations came to nothing, and the United States fell back upon their claim of right. In June 1890 it was reported that certain American revenue cutters had been ordered to proceed to Bering sea. Sir Julian Pauncefote, the British ambassador at Washington, having failed to obtain an assurance that British vessels would not be interfered with, laid a formal protest before the U.S. Government.

Thereupon followed a diplomatic controversy, in the course of which the United States developed the contentions which were afterwards laid before the tribunal of arbitration. The claim that Bering sea was *mare clausum* was abandoned, but it was asserted that Russia had formerly exercised therein rights of exclusive jurisdiction which had passed to the United States, and they relied *inter alia* upon the ukase of 1821, by which foreign vessels had been forbidden to approach within 100 Italian miles of the coasts of Russian America. It was pointed out by Great Britain that this ukase had been the subject of protest both by Great Britain and the United States, and that by treaties similar in their terms, made between Russia and each of the protesting powers, Russia had agreed that their subjects should not be troubled or molested in navigating or fishing in any part of the Pacific ocean. The American answer was that the Pacific ocean did not include Bering sea.

Treaty of Arbitration.—In Aug. 1890 Lord Salisbury proposed that the question at issue should be submitted to arbitration. This was ultimately assented to by the secretary of State, James G. Blaine, on the understanding that certain specific points, which he indicated, should be laid before the arbitrators. On Feb. 29, 1892, a definitive treaty was signed at Washington. Each power was to name two arbitrators, and the president of the French Republic, the king of Italy, the king of Norway and Sweden were each to name one. The points submitted were as follows:—(1) What exclusive jurisdiction in the sea now known as Bering sea, and what exclusive rights in the seal fisheries therein, did Russia assert and exercise prior to and up to the time of the cession of Alaska to the United States? (2) How far were her claims of jurisdiction as to the seal fisheries recognized and conceded by Great Britain? (3) Was the body of water now known as Bering sea included in the phrase "Pacific Ocean," as used in the treaty of 1825 between Great Britain and Russia, and what rights, if any, in Bering sea were held exclusively exercised by Russia after the said treaty? (4) Did not all the rights of Russia as to jurisdiction and as to the seal fisheries in Bering sea east of the water boundary, in the treaty between the United States and Russia of March 30, 1867, pass unimpaired to the United States under that treaty? (5) Had the United States any and what right of protection over, or property in, the fur seals frequenting the islands of Bering sea when such seals are found outside the three-mile limit? In the event of a determination in favour of Great Britain the arbitrators were to determine what concurrent regulations were necessary for the preservation of the seals, and a joint commission was to be appointed by the two powers to assist them in the investigation of the facts of seal life. The question of damages was reserved for further discussion, but either party was to be at liberty to submit any question of fact to the arbitrators, and to ask for a finding thereon. The tribunal was to sit at Paris. The treaty was approved by the Senate on March 29, 1892, and ratified by the President on April 22.

The Arbitration Tribunal.—The sittings of the tribunal began in February and ended in August 1893. The interest of the proceedings lies in the second of the two claims put forward on behalf of the United States. This claim cannot easily be stated in language of precision; it is indicated rather than formulated in the last of the five points specially submitted by the treaty. But its general character may be gathered from the arguments addressed to the tribunal. It was suggested that the seals had some of the characteristics of the domestic animals, and could therefore be the subject of something in the nature of a right of property. They were so far amenable to human control that it was possible to take their increase without destroying the stock. Sealing

upon land was legitimate sealing; the United States being the owners of the land, the industry was a trust vested in them for the benefit of mankind. On the other hand, pelagic sealing, being a method of promiscuous slaughter, was illegitimate; it was *contra bonos mores* and analogous to piracy. Consequently the United States claimed a right to restrain such practices, both as proprietors of the seals and as proprietors and trustees of the legitimate industry. It is obvious that such a right was a novelty hitherto unrecognized by any system of law. The American counsel argued that the determination of the tribunal must be grounded upon "the principles of right," that "by the rule or principle of right was meant a moral rule dictated by the general standard of justice upon which civilized nations are agreed, that this international standard of justice is but another name for international law, that the particular recognized rules were but cases of the application of a more general rule, and that where the particular rules were silent the general rule applied." The practical result of giving effect to this contention would be that an international tribunal could make new law and apply it retrospectively. The American contention was successfully combated by Sir Charles Russell, the leading counsel for Great Britain.

Decision of the Tribunal.—The award, which was signed and published on Aug. 15, 1893, was in favour of Great Britain on all points. The question of damages, which had been reserved, was ultimately settled by a mixed commission appointed by the two powers in Feb. 1896, the total amount awarded to the British sealers being \$473,151 26. Pelagic sealing continued until 1911, when the practice was abolished by a treaty signed by the United States, Great Britain, Russia and Japan.

BÉRIOT, CHARLES AUGUSTE DE (1802–1870), Belgian violinist and composer, was born at Louvain, Feb. 20, 1802, and died at Brussels, April 8, 1870. Although not definitely a pupil of Viotti or Baillot he was much influenced by both. He played in the principal musical centres of Europe, and held appointments at the courts of Belgium and France. From 1843 to 1852 he was violin professor at the Brussels conservatoire.

BERJA, a town of southern Spain, in the province of Almería. Pop. (1920), 10,699. Despite the lack of a railway Berja has a considerable trade. The lead of the Sierra de Gádor mines, which seem to be now exhausted, was until recently sent from here by road to Adra (10m.) for export, and the town is also a collecting centre for ore produce of the sheltered valleys of the Sierras.

BERKELEIANISM denotes the philosophical views of Bishop Berkeley (*q.v.*), and is commonly used as synonymous with subjective Idealism. (See also IDEALISM, and KNOWLEDGE, THEORY OF.)

BERKELEY, GEORGE (1685–1753), Irish bishop and philosopher, the eldest son of William Berkeley (an officer of customs), was born on March 12, 1685, in a cottage near Dysert Castle, Thomastown, Ireland. He passed from the school at Kilkenny to Trinity college, Dublin (1700). During his career at Dublin the works of Descartes and Newton were superseding the older textbooks, and the doctrines of Locke's *Essay* were eagerly discussed. Thus he "entered on an atmosphere which was beginning to be charged with the elements of reaction against traditional scholasticism in physics and in metaphysics" (A. C. Fraser). He became a fellow in 1707. His interest in philosophy led him to take a prominent share in the foundation of a society for discussing the new doctrines, and is further shown by his *Common Place Book* (first discovered and published in 1871), which throws much light on the growth of his ideas and enables us to understand the significance of his early writings. We find here the consciousness of creative thought focused in a new principle which is to revolutionize speculative science. The new principle (nowhere in the *Common Place Book* explicitly stated) may be expressed in the proposition that no existence is conceivable (and therefore possible) which is not either conscious spirit or the ideas (*i.e.* objects) of which such spirit is conscious. In the language of a later period this principle may be expressed as the absolute synthesis of subject and object; no object exists apart from mind. Mind is, therefore, prior both in thought and

in existence, if for the moment we assume the popular distinction. Berkeley thus diverted philosophy from its beaten track of discussion as to the meaning of matter, substance, cause, and preferred to ask first whether these have any significance apart from the conscious spirit. In the pursuit of this enquiry he rashly invaded other departments of science, and much of the *Common Place Book* is occupied with a polemic, as vigorous as it is ignorant, against the fundamental conceptions of the infinitesimal calculus.

In 1707 Berkeley published two short mathematical tracts; in 1709, in his *Essay towards a New Theory of Vision*, he applied his new principle for the first time, and in the following year stated it fully in *A Treatise concerning the Principles of Human Knowledge*, Part 1. In these works he attacked the existing theories of externality which to the unphilosophical mind is proved by visual evidence maintaining that, on ultimate analysis, nature is conscious experience, and forms the sign or symbol of a divine, universal intelligence and will.

In 1711 Berkeley delivered his *Discourse on Passive Obedience* in which he deduces moral rules from the intention of God to promote the general happiness, thus working out a theological utilitarianism, which may be compared with the later expositions of Austin and J. S. Mill. From 1707 he had been engaged as college tutor; in 1712 he paid a short visit to England, and in April 1713 he was presented by Swift at court. His abilities, his courtesy and his upright character made him a universal favourite. While in London he published his *Three Dialogues between Hylas and Philonous* (1713), a more popular exposition of his new theory, for exquisite facility of style these are among the finest philosophical writings in the English language. In November he became chaplain to Lord Peterborough, whom he accompanied on the continent, returning in Aug. 1714. He travelled again in 1715-20 as tutor to the only son of Dr. St. George Ashe (?1658-1718, bishop successively of Cloyne, Clogher and Derry). In 1721, during the disturbed state of social relations consequent on the bursting of the South Sea bubble, he published anonymously an *Essay towards preventing the Ruin of Great Britain*, which shews the intense interest he took in practical affairs. In the same year he returned to Ireland as chaplain to the duke of Grafton, and was made divinity lecturer and university preacher. In 1722 he was appointed to the deanery of Dromore, a post which seems to have entailed no duties, as we find him holding the offices of Hebrew lecturer and senior proctor at the university. The following year Miss Vanhomrigh, Swift's Vanessa, left him half her property. It would appear that he had only met her once at dinner. In 1724 he was nominated to the rich deanery of Derry, and immediately began to devote himself to his scheme of founding a college in the Bermudas, and extending its benefits to the Americans. He obtained from government a promise of £20,000, and after four years of preparation sailed in Sept. 1728, accompanied by some friends and by his wife, daughter of Judge Forster, whom he had married in August. Three years of quiet retirement and study were spent in Rhode Island, but the promised grant was not forthcoming, and Berkeley was compelled to give up his cherished plan. Soon after his return he published the fruits of his studies in *Alciphron, or the Minute Philosopher* (1733), a finely written work in the form of dialogue, critically examining the various forms of freethinking in the age, and bringing forward in antithesis to them his own theory, which shews all nature to be the language of God. In 1734 he was raised to the bishopric of Cloyne. The same year, in his *Analyst*, he attacked the higher mathematics as leading to freethinking; this involved him in a hot controversy. The *Querist*, a work concerned with practical social reform, appeared in three parts, 1735, 1736, 1737. In 1744 was published the *Siris*, partly occasioned by the controversy as to the efficacy of tar-water in cases of small-pox, but rising far above the circumstances of its origin, to an exposition of the principles of Berkeleyian metaphysics. In 1751 his eldest son died, and in 1752 he removed with his family to Oxford for the sake of his son George, who was studying there. He died suddenly on Jan. 14, 1753, and was buried in Christ Church, Oxford.

Berkeley's theory, briefly stated, is this: External things are produced by the will of the divine intelligence; they are caused, and caused in a regular order; there exist in the divine mind archetypes, of which sense experience may be said to be the realization in our finite minds. Our belief in the permanence of something which corresponds to the association in our minds of actual and possible sensations means belief in the orderliness of nature; and that is merely assurance that the universe is pervaded and regulated by mind. Physical science is occupied in endeavouring to decipher the divine ideas which find realization in our limited experience, in trying to interpret the divine language of which natural things are the words and letters, and in striving to bring human conceptions into harmony with the divine thoughts. Instead, therefore, of fate or necessity, or matter, or the unknown, a living, active mind is looked upon as the centre and spring of the universe, and this is the essence of the Berkeleyian metaphysics.

BIBLIOGRAPHY.—The standard edition of Berkeley's works is that of A. Campbell Fraser in 4 vols. (i.-iii. *Works*; iv. *Life, Letters and Dissertation*) published by the Clarendon Press (1871); this edition, revised throughout and largely re-written, was re-published by the same author (1901). Another complete edition edited by G. Sampson, with a biographical sketch by A. J. Balfour, and a useful bibliographical summary, appeared in 1897-98. Prof. Fraser also published an excellent volume of selections (5th ed., 1899), and a short general account in a volume on Berkeley in the *Blackwood Philos. Class*. For Berkeley's theory of vision see manuals of psychology (e.g. G. F. Stout, Wm. James); for his ethical views, A. Bain, *Mental and Moral Science* (1872); H. Sidgwick, *Hist. of Ethics* (5th ed., 1902). See also J. McCosh, *Locke's Theory of Knowledge* (1884); John Watson, *Outline of Philos.* (New York, 1808), T. Lorenz, *Ein Beitrag zur Lebensgeschichte G. Berkeleys* (1900) and *Weitere Beiträge z. Leb. G. B.'s* (1901); Sir L. Stephen, *English Thought in the 18th Century* (3rd. ed., 1902); J. S. Mill's *Dissertations*, vols. ii. and iv.; T. Huxley, *Critiques and Addresses*, pp. 320 seq.; G. S. Fullerton, *System of Metaphysics* (New York, 1904); histories of modern philosophy generally. (R. A.; X.)

BERKELEY, the name of an ancient English family remarkable for its long tenure of the feudal castle built by the water of Severn upon the lands from which the family takes its name, and for the fact that a Berkeley fought the last private battle on English soil. It traces an undoubted descent from Robert (d. 1170) son of Harding. In the age of chivalry the lords of Berkeley were notable warriors. Thomas, the first hereditary baron, who succeeded to the Berkeley lands in the last quarter of the 13th century, had ridden on the barons' side at Evesham, followed the king's wars for half a century of his long life, flying his banner at Falkirk and at Bannockburn, in which fight he was taken by the Scots. His seal of arms is among those attached to the famous letter of remonstrance addressed by the barons of England to Pope Boniface VIII. Maurice, his son, joined the confederation against the two Despencers, and lay in prison at Wallingford until his death in 1326, the queen's party gaining the upper hand too late to release him. But as the queen passed by Berkeley on her way to seize Bristol she gave back the castle, which had been kept by the younger Despenser, to Thomas, the prisoner's heir, who, with Sir John Mautravers, soon received in his hold the deposed king, Edward II., brought thither secretly. The chroniclers agree that Thomas of Berkeley had no part in the murder of the king, whom he treated kindly. It was when Thomas was away from the castle that Mautravers and Gournay made an end of their charge. Thomas of Berkeley fought at Crécy and Calais, bringing six knights and 32 squires to the siege in his train, with 30 mounted archers and 200 men on foot.

Being by his mother a nephew of Roger Mortimer, earl of March, the paramour of Queen Isabel, Maurice Berkeley, who had been taken prisoner at Poitiers, married Elizabeth, daughter of Hugh Despenser, the younger of Edward II.'s favourites and the intruder in Berkeley Castle. With his son and heir Thomas of Berkeley, one of the commissioners of parliament for the deposing of Richard II. and a warden of the Welsh marches who harried Owen of Glendower, the direct male line of Robert fitz Harding failed. On this Thomas's death in 1417 Elizabeth, his daughter and heir, and her husband, Richard Beauchamp, earl of Warwick, the famous traveller, statesman and joustier, seized Berkeley Castle. Earl and countess only withdrew after James

Berkeley, the nephew and male heir, had livery of his lands by the purchased aid of Humphrey of Gloucester. But the Beauchamps returned more than once to vain attacks on the stout walls of Berkeley, and a quarrel of two generations ended with the pitched battle of Nibley Green. Fought between the retainers of William, Lord Berkeley, son of James, and those who followed Thomas Talbot, Viscount Lisle, grandson of the illustrious Talbot and great-grandson of the countess of Warwick, this was the last private battle on English ground between two feudal lords. Young Lisle was shot under the beaver by an arrow, and the feud ended with his death, all claims of his widow being settled with an annuity of £100.

See John Smyth, *Lives of the Berkeleys*, compiled c. 1618, edited by Sir John Maclean (1883-85); J. H. Round, Introduction to the Somerset Domesday, V.C.H. series; G. E. Clough, *Complete Peerage*; Jeayes's *Descriptive Catalogue of the Charters and Muniments at Berkeley Castle* (1892); *Dictionary of National Biography*; *The Red Book of the Exchequer*; Chronicles of Roger of Wendover, Matthew Paris, Adam of Murimuth, Robert of Gloucester, Henry of Huntingdon, etc. (Rolls Series); British Museum Charters, etc.

BERKELEY, MILES JOSEPH (1803-1889), English botanist; born at Biggin Hall, Northamptonshire; educated at Rugby and Christ's college, Cambridge. He became incumbent of Apethorpe in 1837 and vicar of Sibbertoft, near Market Harborough, in 1868. He soon was recognized as the leading British authority on fungi and plant pathology. Some 6,000 species of fungi were credited to him, but his *Introduction to Cryptogamic Botany*, published in 1857, and his papers on "Vegetable Pathology" in the *Gardener's Chronicle*, in 1854 and onwards, show that he had a very broad grasp of the whole domain of physiology and morphology as understood in those days. His pioneer investigations on the potato murrain, caused by *Phytophthora infestans*, on the grape mildew, to which he gave the name *Oidium Tuckeri*, and on the pathogenic fungi of wheat rust, hop mildew, and various diseases of cabbage, pears, coffee, onions, tomatoes, etc., were important in results bearing on the life-history of these pests. Berkeley was the founder of British mycology, and his most important work on that subject is contained in the account of native British fungi in Sir W. Hooker's *British Flora* (1836), in his *Introduction to Cryptogamic Botany* (1857), and in his *Outlines of British Fungology* (1860). His magnificent herbarium at Kew, which contains over 9,000 specimens, and is enriched by numerous notes and sketches, forms one of the most important type series in the world.

A list of his publications will be found in the *Catalogue of Scientific Papers* of the Royal Society, and sketches of his life in *Proc. Roy. Soc.*, 1800, 47, 9, by Sir Joseph Hooker, and *Annals of Botany*, 1897, 11, by Sir W. T. Thiselton-Dyer.

BERKELEY, SIR WILLIAM (c. 1608-1677), British colonial governor in America; was born in or near London, England, about 1608, the youngest son of Sir Maurice Berkeley, and brother of John, first Lord Berkeley of Stratton, one of the proprietors of the Carolinas. He graduated at Oxford in 1629, and in 1632 was appointed one of the royal commissioners for Canada, and on his return was appointed a gentleman of the privy chamber by Charles I. In 1638 he produced a tragi-comedy entitled *The Lost Lady*. In Aug. 1641 he was appointed governor of Virginia and took up his duties the following year. His first term as governor, during which he seems to have been extremely popular, was notable principally for his religious intolerance and his expulsion of the Puritans, who were in a great minority. During the Civil War in England he remained loyal to the king, and offered an asylum in Virginia to Charles II. and the loyalists. On the arrival of a parliamentary fleet in 1652, however, he retired from office and spent the following years quietly on his plantation. On the death, in 1660, of Samuel Matthews, the last parliamentary governor, he was chosen governor by the Virginia assembly, and was soon recommissioned by Charles II. The second period of his governorship was a stormy one. Serious frontier warfare with the Indians was followed (1676) by Bacon's Rebellion (see VIRGINIA), brought on by Berkeley's misrule. His cruelty and barbarity in punishing the rebels did not meet with the approval of Charles II. Berkeley was called to England in 1677 ostensibly to report on the

condition of affairs in the colony, and a lieutenant-governor (Herbert Jeffreys) was put in his place. Berkeley sailed in May, but died soon after his arrival, at Twickenham, and was buried there on July 13, 1677. In addition to the play mentioned he wrote *A Discourse and view of Virginia* (1662); reprinted, Norwalk, Conn. (1914).

BERKELEY, market town, Gloucestershire, England, near the river Severn at the commencement of its estuary, on the G.W. and L.M.S. Railways. Pop. (1921) 790. It lies on a slight rise in the rich pastoral vale to which it gives name, celebrated for its dairies and "double Gloucester" cheese. The manor of Berkeley, whence the family of Berkeley (q.v.) takes its name, is said to have been owned by a nunnery before the Conquest. Charters and fairs were granted to the Berkeley family in the 13th and 14th centuries, and there are references to the settlement as a borough. The corporation was dissolved in 1885.

The town has an Early English and Decorated church and a grammar school. It was the birthplace of Dr. Edward Jenner (1749), who is buried in the church. To the south-east is Berkeley castle, baronial fortress and seat. There is some trade in coal, timber, malt and cheese. The manufacture of cloth, for which Berkeley was formerly noted, had already declined by the 16th century. The Berkeley and Gloucester canal, navigable for vessels of 500 tons, connects Gloucester with the docks at Sharpness, avoiding the difficult navigation of the upper part of the Severn estuary.

BERKELEY, a city of California, U.S.A., on the east shore of San Francisco bay, in the northern part of Alameda county, directly opposite the Golden Gate and adjoining Oakland. It is served by the Southern Pacific and the Santa Fe railways, and a direct ferry service to San Francisco (7m.) was opened in 1927. The area is 8.6 square miles. The population was 56,036 in 1920, of which about a fifth were foreign born, and was estimated at 69,400 in 1927.

The city is built on the Berkeley hills, surrounding on three sides the 530-ac campus of the State university (see CALIFORNIA, UNIVERSITY OF). A major city plan, especially important because territorial expansion is limited, is in process of development. The assessed valuation of property in 1927 was \$88,449.225. While primarily a residential suburb and a cultural centre, the industrial zone along the water-front has about 150 factories, producing a variety of commodities, with an annual value of about \$50,000,000. Berkeley is the seat of the State institute for the deaf and blind, and of three theological seminaries: the Berkeley Baptist divinity school; the Pacific Unitarian school for the ministry; and the Pacific School of Religion (undenominational). Many artists, musicians and writers make Berkeley their home. There is a community playhouse and an amateur symphony orchestra.

Berkeley was named after George Berkeley, bishop of Cloyne (1685-1753), author of the poem "Destiny of America," which contains the line, "Westward the course of empire takes its way." Its site was part of the Spanish grant to the Peralta family, and later was held by American pioneers. Settlement as a town began when the university moved there in 1873. In 1890 it was still a quiet village with a population of 5,101, but this grew to 13,214 in 1900 and 40,434 in 1910. In 1909 a city charter was secured, providing for initiative, referendum and recall, and establishing a commission form of government, which was superseded in 1923 by the council-manager form.

BERKHAMPSTEAD (GREAT BERKHAMPSTEAD), urban district, Hertfordshire, England, on the main line of the L.M.S.R., 28m. N.W. of London. Pop. (1921) 7,292. It lies in the narrow valley of the Bulbourne and is close to the Grand Junction canal. The name "Great Berkhamstead" is given to distinguish it from Little Berkhamstead near Hatfield in the same county.

Berkhamstead (Beorhamstede, Berchehamstede) was undoubtedly of some importance in Saxon times since there were 52 burgesses there at the time of the Conquest. The town rose to importance with its castle, which is said to have been built by Robert, count of Mortain, and when the castle fell into ruin after 1496 the town also began to decay. In 1618, however, the bur-

gessees received an incorporation charter which was retained until the 18th century. Before the 13th century the burgesses held a weekly market on Sunday and a yearly fair on St. James's day, but in 1218 Henry III. altered the market day to Monday. Roofing tiles were manufactured as early as the 13th century, and in Elizabeth's reign the making of malt was the chief industry. The church of St. Peter is an early foundation built in mixed styles. The poet William Cowper was born in the rectory in 1731. The grammar school dates from 1541. Of the castle some earthworks and wall-fragments remain. Straw-plaiting is the chief and oldest industry, and there are chemical works and some manufacture of small wooden wares. It is to some extent a residential outpost of London.

BERKSHIRE (abbreviated Berks), a southern county of England, bounded on the north by Oxfordshire and Buckinghamshire, east by Surrey, south by Hampshire and west by Wiltshire. Its entire northern boundary is formed by the River Thames, in the basin of which practically the whole county is included. The key to the structure of the county is to be found in a consideration of the chalk which dominates south-east England. The chalk is folded along east-west lines, here represented by an anticline running through Kingsclere and Ham and along the Vale of Pewsey, where the anticline is orographically weak. The centre of the county is occupied by the broad-backed Berkshire or White Horse downs, which are related to the Marlborough downs on the west, and to the Chilterns beyond the Goring gap. These represent the worn edge of the chalk rising from the London basin and from its western extension, the Vale of Kennet. The Eocene clays of this structural basin occur in patches on the downs and once covered most of the chalk. Below 500ft. they help to form interfluvial plateaux, and become definitively continuous below the junction of the Lambourn and the Kennet east of Newbury. The Reading beds are exposed in and take their name from the brickfields about Reading. The London clay is found throughout the south of the county, while the Bagshot beds occur in the Kennet valley and in the extreme south-east. Among the more superficial deposits we note the clay-with-flints, typically developed on the summits and slopes of the Berkshire downs and making arable cultivation and settlement possible. Plateau and valley gravels are widely distributed, and a good deal of alluvium, including fairly thick beds of peat, occurs at intervals near the River Kennet between Hungerford and Reading. The scarped slopes to the south, the Sydmonton range, send few tributaries to the Kennet. These hills are mainly outside the county, but their highest point, Inkpen Beacon (nearly 1,000ft.), which is one of the highest portions of the chalk in England, falls in Berkshire. The River Enborne, rising there, and flowing east parallel to the Kennet until turning north to join it, is for a considerable distance the county boundary. The Kennet naturally receives more contributions from the dip-slope of the Berkshire downs, and of these tributaries the Lambourn is the chief, probably because it follows a slight syncline of the chalk. From Newbury to Lambourn the valley furnishes a line of approach into the heart of the downs. Towards the west the Kennet valley almost meets the Vale of Pewsey beyond the confines of the county near Savernake, and forms an east-west lowland route of great historic importance, composed of two entirely different structural portions.

Another important route is provided by the Goring gap, where the Thames breaks from the Oxford valley between the Ilsley downs and the Chilterns to join the Kennet, probably the main headwater of the original Thames, at Reading. The north and east of the county are entirely in the Thames valley. In the north face of the escarpment of the Berkshire downs we find the lower chalk with a hard bed, Totternhoe stone. At the foot of the chalk escarpment is the upper greensand with a narrow crop towards the west which is broken up into patches eastwards. Looking northward from the chalk hills, the low-lying ground is occupied successively by the gault clay, the Kimmeridge clay, and finally by the Oxford clay, which extends beyond the Thames into Oxfordshire. This low-lying tract is relieved by an elevated ridge of Corallian beds, between the Kimmeridge clay and the gault. It extends from near Faringdon past Abingdon to Cumnor

and Wytham hills. These hills fill a deep northward bend of the Thames and overlook the city of Oxford. Between this line of hills and the Berkshire downs is the famous Vale of White Horse (*q.v.*) traversed by the small River Ock. Between Reading and Windsor the Thames makes a large bend to the north, and is bordered by low hills. The only tributary of any size in this flat part of the county is the Loddon, south of Reading. In the extreme south-east, however, there is a sandy plateau forming part of Bagshot heath, over 400ft. in elevation and extending into Surrey.

The distribution of prehistoric remains in the area emphasizes the importance of the unit from which Berkshire was to evolve. The gravel beaches of the Thames have yielded palaeolithic flint tools of various types, but there is not much occupational evidence. From Neolithic times on, however, the Berkshire downs assume great importance. They lie on the north-east outskirts of Salisbury plain, an early focus, and have easy connections with the whole of the open chalk lands of the south. A distribution map of the remains of the Beaker folk and of the men of the full bronze age shows the outstanding position of the chalk and of the old Ridgeway running east from White Horse hill. The hill-top camps are also concentrated on the Berkshire downs (*e.g.*, Uffington castle, Membury and Alfred's castle) with Grimsbury (*e.g.*) farther south and Walbury near Inkpen Beacon. The slopes of the downs are dotted besides with short dykes and barrows of various kinds. The almost complete absence of prehistoric earthworks in the east and north of the county illustrates the avoidance of the damp forested lowlands. Belgic tribes occupied the region between the Thames and the south coast during the two centuries preceding the Christian era, and the Atrebatas settled in Berkshire with their capital at Silchester. The choice of this site in the iron age and by the Romans (*Calleva Atrebatum*) indicates the valley-ward spread of some elements of the upland population. The chief Roman roads within the county are portions of those from Caerleon via Cirencester and Bath to Silchester, crossing the Kennet at Newbury, and from Chichester via Silchester to London. Besides these, for which we have evidence in the Antonine Itinerary, there are several other roads claimed to be of Roman date. The Icknield Way followed the ancient Ridgeway from Goring to White Horse hill. The miscellaneous evidences of the Roman period are fairly evenly distributed over the county. Several villas have been found near the Thames from Abingdon to Maidenhead.

Of the Saxon invasion we know little, but there are graveyards at (*e.g.*) Reading, Frilford and Shefford. The earliest known settlements, "Hams," were near the rivers, but the essential base of operations in the "colonizing" of the area, which is supposed to have taken place from the central upland of Hants and Wilts, was the open land of the Berkshire downs, emergent from the forested lowlands. This chalk-land had been the centre of life for centuries, and formed the nucleus for the county of Berkshire. The origin of the county, thus explained, is comparable with that of most of the southern English counties, and contrasts with the origin of the Midland counties (*e.g.*, Bedfordshire, *q.v.*) round castles on the waterways. That the Thames forms the county boundary along the entire northern side is explicable when we realize this. Eastward the boundaries were pushed as far as Windsor forest, while in the south the Kennet valley was naturally occupied together with some of the downs bordering Hampshire on the north. Berkshire remained a part of Wessex, in spite of the encroachment of its northern neighbour, until 779, when Offa, ruler of Mercia, seems to have annexed the whole county to his kingdom. In 853, however, after the defeat of the Mercians by the Northmen on the lower Thames, it once more became part of Wessex.

At the time of the Norman invasion Berkshire formed part of the earldom of Harold, and supported him staunchly at the battle of Hastings. This loyalty was punished by very sweeping confiscations, and at the time of the Domesday survey no estates of any importance were in the hands of Englishmen. When Alfred divided the country into shires, this county received the name of Berrocscir, as Asser says, "from the wood of Berroc, where the box-

tree grows most plentifully." At the time of the survey it comprised 22 hundreds; at the present day there are only 20, of which 11 retain their ancient names. Many parishes have been transferred from one hundred to another, but the actual boundary of the county is practically unchanged. Parts of the parishes of Shilton and Langford formed detached portions of the shire, until included in Oxfordshire in the reign of William IV. Portions of Combe and Shalbourne parishes have also been restored to Hampshire and Wiltshire respectively, while the Wiltshire portion of Hungerford has been transferred to Berkshire. The county was originally included in the see of Winchester, but in A.D. 909 it was removed to the newly-formed see of "Wiltshire," afterwards united with Sherborne. In 1075 the seat of the bishopric was removed to Salisbury, and in 1836, by an order in council, Berkshire was transferred to the diocese of Oxford. The archdeaconry is of very early origin, and is co-extensive with the county. Formerly it comprised four rural deaneries, but the number has lately been increased to nine. Much of the early history of the county is recorded in the *Chronicles* of the abbey of Abingdon, which at the time of the survey was second only to the Crown in the extent and number of its possessions. It was perhaps largely due to the great influence of the abbey and the large amount of land it possessed, that few other religious foundations succeeded in establishing themselves in the neighbourhood. Another great Benedictine abbey, of which there are scanty remains, was that of Reading. About 1160 a priory for Austin Canons was founded at Ploughley.

The more settled conditions which followed Norman rule saw an increase of settlement and population throughout the county, though there were frequent interruptions, as during the disorders of Stephen's reign, when Wallingford was the scene of the final treaty in 1153. A serious blow to the agricultural life of the county, as to the rest of England, was inflicted by the Black Death in 1348. The rearing of sheep must always have been the chief occupation of the open down and heath lands, and even after the valley-ward movement of the population considerable numbers of people must have continued to lead a pastoral life on the high downs. An interesting point is that the population of the royal manor of Lambourn, only one of several of that name, was, in 1086, nearly double that of Newbury. The woollen industry, developing especially after the emancipation of labour consequent upon the Black Death and the Peasants' Revolt, had already been established at Reading in the time of Henry I., and at Newbury from the early 13th century. At first this trade was confined to the export of raw material, but the reign of Edward III. saw the introduction of the clothing industry, for which the county afterwards became famous. This began to decline in the 17th century, and in 1641 the Berkshire clothiers complained of the state of their trade.

The use of the Kennet-Pewsey valley-way goes back at least to the later middle ages, and there are many bits of evidence, especially referring to Hungerford, to show how important the route was in the 15th century and later. The road probably then ran south on the river from Hungerford to Newbury. This route, during the Civil War, was naturally a thoroughfare from the parliamentary centres to the west, battles being fought near Newbury in 1643 and 1644. The famous Bath road was not made until 1746. The road traffic between London and Bristol was then at its height, and it was later suggested that water transit, then so popular throughout the country, should be used. The Kennet and Avon canal, projected in 1794, was completed in 1810. For some time it served to carry goods along this east-west route, but in 1847 it was superseded by the railway from Reading to Hungerford, which was extended to Devizes the following year. About 1900 this line was developed as a main route between Westbury and Newbury. A main G.W. railway line crosses the county from east-west by Maidenhead, Reading, the Goring gap and Didcot to Swindon. North-south lines run from Oxford via Didcot to Newbury and Hampshire, and south from Reading; while the Lambourn Valley light railway runs north-west to Lambourn from Newbury. Wide water-communications are afforded by the Thames. The immense increase of motor traffic since the World

War has led to an improvement of main roads, and Berkshire, occupying the two main valley routes west from the metropolis, deals with a vast amount of road traffic. The metropolitan character of the county is further illustrated by the numerous public schools, e.g., Radley, Wellington, and Bradfield colleges, and the Sandhurst Royal Military college. Besides the royal castle of Windsor there are many large country residences. Reading has a university, chartered in 1926.

The county is mainly agricultural. About seven-ninths of the total area is under cultivation; a large proportion of this being in permanent pasture, as much attention is paid to dairy-farming. Butter and cheese are largely produced, and the making of condensed milk is a branch of the industry. Many sheep are pastured on the downs, important sheep-markets being held at the small town of East or Market Illey; and an excellent breed of pigs is named after the county. The parts about Faringdon are specially noted for them. Oats are the principal grain crop; although a considerable acreage is under wheat. Turnips and swedes are largely cultivated, and apples and cherries are grown. The Vale of White Horse is especially productive, and Camden speaks of the great crops of barley grown in the district. A modern tendency is towards the planting of conifers in place of the slower growing oak in the woodland and upon the heathland. The primitive oak woodland is developed equally well on clays, sands and plateau gravels, but there is surprisingly little primitive beech woodland on the chalk, though there are numerous plantations on the downs and occasional "hangers" on the scarp slopes.

The only manufacturing centre of first importance is Reading, which is principally famous for its biscuit factories. The manufacture of clothing and carpets is carried on at Abingdon; but the ancient woollen industry of the county is long extinct. Engineering works and paper mills are established at various places; and boat-building is carried on at Reading and other riverside stations. There are extensive seed warehouses and testing grounds near Reading; and the Kennet and Windsor ales are in high repute. Whiting is manufactured from chalk at Kintbury on the Kennet.

The area of the county, including the county borough of Reading, is 463,834 ac., with a population, in 1921, of 294,821. The population of the administrative county is 202,543.

There are 20 hundreds, and 202 ecclesiastical parishes or districts wholly or in part within the county. There are three county divisions, Abingdon, Newbury and Windsor, each returning one member, while the parliamentary borough of Reading returns one member. Berkshire is in the Oxford circuit, and assizes are held at Reading. It has one court of quarter sessions and is divided into 12 petty sessional divisions.

The municipal boroughs, with 1921 populations, are:—Abingdon (7,165), Maidenhead (16,730), Newbury (12,295), New Windsor (20,122), Reading, the county town and a county borough (92,278), Wallingford (2,726), and Wokingham (4,475). The only urban district is Wantage (3,886). Other towns are Faringdon, Hungerford, Lambourn and Sandhurst. The villages of Bray, Cookham and Tilehurst, like others on the banks of the Thames, have grown into residential towns.

BIBLIOGRAPHY.—Chief of the older works are: Elias Ashmole, *Antiquities of Berkshire* (1719, 2nd ed., London, 1723; 3rd ed., Reading, 1736); D. and S. Lysons, *Magna Britannia*, vol. I. King, *History of Berkshire* (1887); Lowsley, *Glossary of Berkshire Words* (1888); and *Index to Wills in the Court of the Archdeacon of Berkshire, 1508-1652* (1893); *Victoria County History, Berkshire*. See also the *Berks Archaeological Society's Quarterly Journal, Berkshire Notes and Queries*, and, for the Newbury region, report of Regional Survey Conference held at Newbury, 1917.

BERKSHIRE HILLS, the name applied to the highlands of western Massachusetts, are a part of the Appalachian system, and a continuation of the Green mountains of Vermont. The Berkshire country is among the most beautiful regions in the United States. It is a rolling highland dominated by long, wooded ridges, remarkably even-topped in general elevation (about 1,500 ft.), and intersected and broken by deep valleys. The chief streams are the Deerfield and Westfield in the east and the Hoosac and Housatonic in the west. About a score of the summits are over

2,000 ft. above sea-level, and of these the highest are Greylock, or Saddleback (3,505 ft.) and Mt. Williams (3,040 ft.), in the extreme north-west corner of the State. Because of its numerous charming lakes, the district is often called the Lake Region of America, partly from the comparableness of its scenic beauties with the English lake country. The Berkshires have been, for many years, a favourite holiday resort.

BÊRLAD, the capital of the department of Tutova, Rumania, on the River Bêrlad, which waters the high plains of eastern Moldavia, and on the Galatz-Jassy railway. Pop. (1924) 30,000, of whom about one-fourth were Jews. Bêrlad possesses a few good modern buildings, including a fine hospital administered by the St. Spiridion foundation of Jassy. There are manufactures of soap and candles and some trade in timber and farm produce; also a large annual horse-fair. Near by are traces of a Roman camp.

BERLAGE, HENDRIK PETRUS (1856—), Dutch architect, received his technical training at Amsterdam and Zürich and eventually settled at The Hague. As his career progressed he broke away from the Renaissance and Gothic styles which he had originally followed and finally succeeded in expressing the conception of beauty prevailing in his own time. Under the influence of these new ideas architecture in Holland reached an important stage of development. The chief characteristics of Berlage's style are simplicity of form, severity of line and a preference for brick as a material. In later years he was actively concerned with urban extension, and in this connection became architectural adviser to the cities of Amsterdam, The Hague and Rotterdam.

BERLICHINGEN, GOETZ or GOTTFRIED, VON (1480–1562), called "Goetz of the Iron Hand," German knight, was born at the castle of Jagsthausen now in Württemberg. In 1497 he entered the service of Frederick IV., margrave of Brandenburg-Ansbach, and in 1498 fought for the emperor Maximilian I., in Burgundy, Lorraine and Brabant, and next year in Switzerland. About 1500 he raised a company of freelances, and at their head took part in various private wars. In 1505, while assisting Albert IV., duke of Bavaria, at the siege of Landshut, his right hand was shot away, and an iron one was substituted which is still shown at Jagsthausen. In spite of this, "Goetz of the Iron Hand" continued his feuds, their motive being mainly booty and ransom. In 1512 an attack near Forchheim on merchants returning from Leipzig fair, caused him to be put under the ban of the empire by Maximilian, and he was only released from this in 1514 upon a promise to pay 14,000 gulden. In 1516 he raided Hesse and held to ransom Philip IV., count of Waldeck, and in 1518 was again placed under the ban. He fought for Ulrich I., duke of Württemberg, when he was attacked by the Swabian League in 1519. In violation of the terms of capitulation of Möckmühl, he was held prisoner and handed over to the citizens of Heilbronn, but owing to the efforts of Sickingen and Georg von Frundsberg, was released in 1522. When the Peasants' War broke out in 1525 Goetz was compelled by the rebels of the Odenwald district to act as their leader. For his part in the rebellion he was acquitted by the imperial chamber (Oct. 17 1526). But the Swabian League seized the opportunity of paying off old scores against him. Lured to Augsburg under promise of safe conduct, he was treacherously seized (Nov. 28 1528) and kept a close prisoner for two years. In 1530 he was liberated. He appears to have remained quietly at his castle of Hornberg on the Neckar until 1540. In 1542 he fought against the Turks in Hungary and in 1544 accompanied Charles V. when he invaded France. He returned to Hornberg where he died on July 23 1562. He was twice married and left three daughters and seven sons. The counts von Berlichingen-Rossach, of Helmstadt near Heidelberg, one of the two surviving branches of the family, are his descendants. The other branch, that of the Freiherrn von Berlichingen-Jagsthausen, is descended from Goetz's brother Hans. Goethe's play "Goetz von Berlichingen" marked an epoch in the history of German drama.

See R. Pallmann, *Der historische Goetz von Berlichingen* (1894); F. W. G. Graf von Berlichingen-Rossach, *Geschichte des Ritters Goetz*

von Berlichingen und seiner Familie (Leipzig, 1861). Goetz's *Autobiography*, valuable as a record of his times, was first published by Pistorius at Nuremberg (1731), and again at Halle (1886).

BERLIN, IRVING (1888—), adopted name of Israel Baline, American song writer, was born in Russia, May 11, 1888, and was brought to the United States in 1892. He left home at 14 to earn his living, finding employment as a singing waiter in various Chinatown and Bowery cabarets in New York. There he began to write song lyrics and compose melodies. The increasing popularity of his songs enabled him in 1919 to open a music publishing business. In 1920, in partnership with Sam Harris, he built the Music Box theatre in New York city, for which he wrote a number of highly successful revues. "Alexander's Ragtime Band" (1911), "Everybody's Doin' It" (1911) and several other compositions gave him international renown as the pioneer of ragtime music. Its subsequent evolution into jazz owes much to his later work, such as "Pack Up Your Sins" (1922) and "Everybody Step" (1921), characterized by complex work, rhythms and intricate melody. His songs "Always," "All Alone," "Remember," "What'll I Do?" (all 1925) and "Russian Lullaby," "What Does It Matter?" (both 1926) were universally popular.

See Alexander Woollcott's *The Story of Irving Berlin* (1925). A discussion of his work will be found in Gilbert Seldes' *The Seven Lively Arts* (1924).

BERLIN, ISAIAH (1725–99), an eminent rabbi of Breslau; author of notes on the Talmud stimulating critical study of that work.

BERLIN, capital and largest city of the German Reich, and also of the republic of Prussia. It is the seat of the parliament (*Reichstag*) and the Prussian diet (*Landtag*), and of the state offices of the German realm, except the supreme court of Justice (*Reichsgericht*), which is fixed at Leipzig. The city lies in a flat sandy plain, 110 ft. above sea-level, on both banks of the navigable Spree, which intersects it from south-east to north-west. The highest point in the immediate neighbourhood is the Kreuzberg (200 ft.), a hill in the southern suburb of Schöneberg, which commands a fine view of the city. In the middle ages, while Brandenburg was the capital of the Mark, Berlin was of very moderate importance at the junction of the Havel and Spree farther east, and by each river it was possible to approach the Oder and by the united one Brandenburg and the Elbe.

Growth of the City.—In 1646 the Great Elector (Frederick William) married a Dutch princess, and during his reign Brandenburg became a Protestant refuge and a field for Dutch energy. Important canal construction was undertaken and the name of the Friedrich Wilhelm canal from the Oder to the Spree commemorates an achievement of the Great Elector. These canal tracks were marked out by nature in the surface features of the country. The passing away of the great ice sheets has left on the northern plain of Europe long east to west lines of low hills formed of terminal moraines. The rivers follow the east to west troughs between moraines until they break through to the north at weak spots in the successive lines. (See Map.) These east and west courses were organized into the great canal communication system which emphasized the focal position of Berlin. Thenceforward Berlin gathered traffic to itself by an elaborate system of roads, canals and, later, railways, and thus became a new power, which, through the German empire, was to dominate the northern plain. In considering the focal position of Berlin it is important to emphasize also that it was situated not only on the east to west route but at the focus of the morainic lines of hills as well. (See Map.)

With the consolidation of the German empire, after the Franco-Prussian War of 1870–71, Berlin grew enormously. Housing, drainage and water supplies, which had previously been notoriously bad, were now greatly improved. Streets became well paved and lighting improved, while the Congress of Berlin in 1878 gave added status to the city. The great international railway lines, which developed after 1870, tended to focus here as well. By the beginning of the 20th century Berlin was a first rate modern city. Almost equidistant from the remotest frontiers of Prussia, from north to south and from east to west, its situation has been

the principal determining factor in its rapid rise to the position of the greatest industrial and commercial city on the Continent, and now the third largest city in the world. The oldest part of Berlin, the city and Alt-Köln, built along the arms of the Spree, is, together with that portion of the town lying immediately west, the centre of business activity. The west end and the south-west are the residential quarters; the north-west is largely occupied by

MAP SHOWING HOW BERLIN IS SITUATED AS REGARDS THE NATURAL CONFIGURATION OF THE SURROUNDING TERRAIN

It lies at the focal point of low hills which were once the terminal moraines of glaciers. The rivers Oder, Weser and Elbe run from east to west in the troughs between the hills, while troughs in other directions made the construction of a canal system a simple matter. To this work, begun in 1616, and to the facilities offered by the same natural features for road, and later, railway construction, Berlin largely owes its position to-day as the most important city in Northern Central Europe

academic, scientific and military institutions; the north is the seat of machinery works; the north-east of the woollen manufactures; the east and south-east of the dyeing, furniture and metal industries, and the south of railway works.

In 1870 Berlin was practically bounded on the south by the Landwehr canal, but it has since extended far beyond, and the Tempelhofer Feld, where military reviews were held, then practically in the country, is now surrounded by houses. The Landwehr canal, leaving the Spree near the Schlesische Tor (gate), and rejoining it at Charlottenburg, is flanked by fine boulevards and crossed by many bridges. The object of this canal was to relieve the congestion of the water traffic in the heart of Berlin. It was superseded in 1906 by the Teltow canal to the south, which leaves the Spree above Berlin at Köpenick, and, running south of Rixdorf, Sudende and Gross-Lichterfelde, enters the Havel at Teltow. In 1914 a ship canal to Stettin was begun, and in Sept. 1923 a new harbour, called the "West Harbour," was opened; here 68 large ships from the Elbe could be loaded simultaneously. The boundaries of the city remained the same from 1860 to 1920, although in 1912 an association of the city and its suburbs was formed and the whole was called "Greater Berlin." A law passed in 1920, however, made this whole area one municipality. Area 332 sq. miles. An idea of the rapid growth of the city may be gathered from the population statistics. It has been estimated that the figure in 1688 was only 8,000. In 1816 it was 197,712; in 1871, 826,341; in 1905, 2,033,900 and in 1925 it was 4,013,588; part of this phenomenal rise is due to extension of boundaries.

Streets and Public Buildings.—The social and official life of the capital centres round Unter den Linden, which runs from the former royal palace to the Brandenburger Tor. This street, one of the finest and most spacious in Europe, nearly a mile in length, its double avenue divided by a favourite promenade, planted with lime trees, presents Berlin life in all its aspects. South of Unter den Linden lies the Friedrichstadt, with its parallel lines of straight streets—the official quarter of the capital—which extends to the busy Leipzigerstrasse, running from the Potsdamer Platz to the Dönhofsplatz. This street and Unter den

Linden are crossed at right angles by the Friedrichstrasse, 2½ miles long, and form the chief shopping centres. In the city proper, the Königstrasse and the Kaiser Wilhelmstrasse, the latter a continuation of Unter den Linden, are the chief streets; while in the fashionable south-west quarter are Viktoriastrasse, Bellevuestrasse, Potsdamerstrasse, Kurfürstenstrasse and the Kurfürstendamm. Among the most important squares are the Opernplatz, the Gendarmenmarkt, the Schlossplatz, the Lustgarten, the Pariserplatz, at the Brandenburg Gate, the Königsplatz, the Wilhelmplatz, the circular Belle-Allianceplatz and, in the western district, the spacious Lützowplatz. The establishment of the imperial government in Berlin naturally brought with it the erection of a large number of public buildings, and the great prosperity of the country (1870–1914), as well as the enhanced national feeling, enabled them to be built on a fine scale. First in importance is the Reichstagsgebäude (see ARCHITECTURE), in which the federal council (*Bundesrat*) and the imperial parliament (*Reichstag*) hold their sittings. A special feature is the library, which is exceedingly rich in works on constitutional law. A house was also built for the Prussian parliament (*Landtag*) in the Albrechtstrasse. Other buildings included the patent office on the site of the old ministry of the interior, the ministry of posts (with post museum) at the corner of the Mauerstrasse and Leipzigerstrasse, the central criminal court in Moabit, the courts of first instance on the Alexanderplatz, the ministry of police and the *Reichsversicherungsamt*, the centre for the great system of state insurance. In addition to these, many buildings were restored and enlarged, chief among them being the armoury (*Zeughaus*), the war office and the ministry of public works, while the royal mews (*Marstall*) was entirely rebuilt. The new Berlin, the creation of 1870–1910, is dominated by the Unter den Linden about which stand evidences of the great central administrative power wielded by the city. Against this array of administrative buildings those giving expression to artistic, intellectual and religious life seem somewhat subordinate. At the Schloss end of Unter den Linden are the cathedral, a sumptuous, though somewhat clumsy, Renaissance building erected in 1893, and the museums, university, library, opera and the former palace of the Crown Prince, now a gallery of modern pictures. A new museum is being built for the Pergamon antiquities. The Kaiser Friedrich museum, standing between two arms of the Spree, is a building of the Italian baroque style, built in 1904. Here is the national gallery of pictures the statuary of the Christian epoch and the numismatic collection. The Kunstgewerbe museum, at the corner of the Königgrätzerstrasse and Albrechtstrasse, contains valuable specimens of applied art.

The former royal palace is a huge quadrangular building with four courts. The Weisse-Saal within was used for court pageants. In 1921 the Schloss museum of pottery, silver and furniture was opened in this palace. The Opernhaus and Schauspielhaus are state supported theatres of old standing. There are many private play-houses.

University and Schools.—The Friedrich Wilhelm university was founded in 1810, when Prussia had lost her celebrated University of Halle, which Napoleon had included in his newly created kingdom of Westphalia. It was as a weapon of war, as well as a nursery of learning, that Frederick William III. and those associated with its origin called it into existence. Wilhelm von Humboldt, Fichte, Neander, Savigny, Hegel, Niebuhr and others began to make its fame, and they were followed by many world-renowned successors, including Bopp, Schelling, Richter, the brothers Grimm. The great names of still later days are innumerable, but one may instance Virchow, du Bois Reymond, von Ranke, Curtius, Lipsius, Kiepert, Helmholz, van't Hoff, Koch, E. Fischer, Waldeyer, Mommsen, Harnack, Penck, de Vries. The university has long been housed in a palace of Prince Henry of Prussia and not until 1913–19 were any important additions made to the overcrowded buildings, when two north wings were added.

There are 29 Gymnasien (classical schools), 46 Realgymnasien (modern), 23 Oberrealschulen, 1 Progymnasium, Berlin Mariendorf, 2 Real progymnasien and 41 Realschulen (commercial) in Berlin; institutions of university rank include the technical high

school at Charlottenburg, highly equipped for all scientific work, the school of mines, the agricultural college, the veterinary college, the seminary for oriental languages and the high school for music. Leibnitz founded in 1700 the Royal Academy of Sciences, one of the most important of learned societies. Among the public monuments Rauch's statue of Frederick the Great, in Unter den Linden, is one of the most celebrated, while Begas' statue of William I. is enormous. A second group of monuments on the Wilhelmplatz commemorates the generals of the Seven Years' War; and a third in the neighbourhood of the opera-house the generals who fought against Napoleon I. On the Kreuzberg a Gothic monument in bronze was erected by Frederick William III. to commemorate the victories of 1813-15; and in the centre of the Königsplatz stands a lofty column in honour of the triumphs of 1864, 1866 and 1870-71. Literature, science and art are represented in different parts of the city by statues and busts of Rauch, Schinkel, Thäer, Beuth, Schadow, Winckelmann, Schiller, Hegel and Jahn. On the Königsplatz, between the column of Victory and the Reichstagsgebäude, is the bronze statue of Bismarck, unveiled in 1901. From the south side of the Königsplatz, crossing the Tiergarten and intersecting the avenue from the Brandenburg gate to Charlottenburg, runs the broad Siegesallee, adorned by thirty-two groups of marble statuary representing Hohenzollern rulers, the gift of the emperor William II. to the city. The Tiergarten park has statues of Queen Louisa, Goethe and Lessing.

Enviroms.—On the east, north and west the city was surrounded at a distance of some 5m. from its centre by a thick belt of pine woods, the Jungfernheide, the Spandauer Forest and the Grunewald, the last-named stretching away in a south-westerly direction as far as Potsdam and fringing the beautiful chain of Havel lakes. After the opening of the circular railway in 1871 these districts were developed and a "villa colony" was built at the edge of the Grunewald between the station West-end and the Spandauer Bock. From these beginnings, owing mainly to the expansion of the important suburb of Charlottenburg, has resulted a complete transformation of the eastern part of the Grunewald into a picturesque villa suburb, which is connected by the Kurfürstendamm with the city. The former fishing villages on the shores of the lakes, notably the Wannsee, are now an important residential area.

Administration.—The rapid growth of the suburbs, which were independent communities, necessitated the adoption of certain main lines of procedure, applicable both to them and to Berlin, in order to prevent conflicting action on the part of the authorities on one side and the other. This led, in 1911, to the creation of Greater Berlin, as, in the first instance, an association of the city with the more important outlying districts for special objects. It embraced the City of Berlin and the towns of Charlottenburg, Schöneberg, Neukölln, Wilmersdorf, Lichtenberg and the administrative circles of Teltow and Niederbarnim. Its objects were to institute a common control of streets, roadways and the elevated railway, also of building and street alignment plans, the uniform co-ordination of police regulations and the acquisition of large tracts of forest and of land for building. This special union came into force on April 1, 1912. It soon became manifest, however, that, beyond co-operation for special purposes, a further co-ordination of the administrations of these places was requisite. It was not until the year 1920 that it was possible, after long negotiations, to form a new municipality of Berlin, embracing all the suburbs under a single united administration. A law to this effect was carried through the Prussian Constituent Assembly on April 27, 1920, and was put into force on October 1 of the same year. This law effected the centralization of Berlin and all its suburbs into one uniform municipal region (*Stadtbezirk*), but, nevertheless, left large powers of local self-administration to the individual communes (*Gemeinden*). The water-supply is mainly derived from works on the Müggel and Tegeler lakes, the river water being carefully filtered. The city is divided into twelve radial systems, each with a pumping station, and the drainage is forced through mains to sewage farms. In 1915 the city purchased the Berlin electrical works.

The city is very richly endowed with charitable institutions for the relief of pauperism and distress. In addition to the municipal support of the poor-houses there are large funds derived from bequests for the relief of the poor. The hospital organization is also well appointed. State, municipal and private charity join hands in the relief of sickness. Of the municipal hospitals the largest is the Virchow hospital, situate in Moabit and opened in 1906; then comes that of Friedrichshain, while the state controls six (not including the prison infirmaries), of which the renowned Charité in the Luisenstrasse is the principal.

Industry, Trade and Commerce.—The old wool industry has become much extended and now embraces products such as shawls, carpets, hosiery, etc. Its silk manufactures, formerly so important, have, however, gradually gone back. It is particularly in the working of iron, steel and cloth and in the by-products of these that Berlin excels. The manufacture of machinery shows an enormous development. Among the chief articles of manufacture and production are railway plant, sewing machines, bicycles, steel pens, chronometers, electric and electric-telegraph plant, bronze, chemicals, soap, lamps, linoleum, china, pianofortes, furniture, gloves, buttons and artificial flowers. It has extensive breweries. Berlin is also the great centre and the chief market for speculation in corn and other cereals which reach it by water from Poland, Austria and Russia, while in commerce in spirits it rivals Hamburg. It is also a large publishing centre and has become a serious rival to Leipzig. Berlin has markets conveniently situated at various accessible places within the city, of which the central market near the Alexanderplatz is the most important. The central cattle market and slaughter-houses for the inspection and supply of the fresh meat consumed in the metropolis is in the north-east on the Ringbahn, upon which a station has been erected for the accommodation of meat trains and passengers attending the market.

Communications.—Berlin is the centre of the German network of railways. No fewer than twelve main lines concentrate upon it. Internal communication is provided for by the Ringbahn, or outer circle, which was opened in 1871, and by a well-devised system which connects the termini of the main lines. The through traffic coming from east and west is carried by the Stadtbahn, or city railway, which also connects with and forms an integral part of the outer circle. This line runs through the heart of the city. Originally a private enterprise, it has been owned by the State since 1878. Lying apart from the system are the Lehrter Bahnhof for Hamburg and Bremen, the Stettiner for Baltic ports, and the Görlitzer, Anhalter and Potsdamer termini for traffic to the south. The North and South Tube, begun before 1914, was opened in 1923. (X.)

HISTORY

Berlin is a comparatively young town. When the Saxon North Mark was founded in the 12th century by Albert the Bear, after successful wars against the indigenous Slavs, it comprised at first only a little land on the east bank of the Elbe. It was only gradually that Albert's successors penetrated farther into the districts of the upper Havel and the Spree, and only at the beginning of the 13th century that the first towns were founded in these districts. It can hardly be doubted that the choice of this particular site for the foundation of the two towns directly contiguous to one another was due to the wish to safeguard the important crossing of the Spree. Berlin grew up south of the Spree, Kölln north of it, on the island formed by the two arms of the river. The two towns must have been founded at about the same date. The first mention of Berlin in the records which have been preserved occurs in 1230; Kölln appears to be a little older. The charter and administration of the two towns was at first totally separate, even though they had a common civil government and common courts of justice from 1307 onwards. Only in 1709 were they completely amalgamated.

It was soon found that the situation of the two new towns was advantageous for commerce to the east and north-east, and they quickly became prosperous. Their military importance as bases for the German dominion became secondary when the fron-

tiers of the Mark were extended farther to the north and east. Their rapid commercial growth brought an increasing need to enter into closer and permanent relations with the commercial cities of northern Germany, which at this period were growing up rapidly. They joined the great Hanseatic League, which was formed in the latter half of the 13th century, and embraced all important towns in northern Germany. They were soon among the leading cities of the Mark of Brandenburg and were thus

GRAPH OF THE WEATHER OF BERLIN. THE THERMOMETER SHOWS THE MEAN ANNUAL TEMPERATURE, AND THE CURVE THE NORMAL MONTHLY TEMPERATURE. THE COLUMNS INDICATE THE NORMAL PRECIPITATION FOR EACH MONTH.

involved in the many internal struggles resultant on the change of dynasties and the antagonisms which arose between princes, nobles, and cities after the extinction of the Ascanian line in the 14th century. Neither the Wittelsbachs, to whom the Emperor Louis the Bavarian granted the province, nor the house of Luxemburg, their successors, were able to establish their authority securely in this district, and the cities of Berlin and Kölln thus long remained almost wholly independent, especially as their connection with the Hanseatic League (*q.v.*) put them in a strong position, even towards their own sovereign prince. In 1391 they received complete judicial authority within their walls.

Conditions changed only after 1415, when the Hohenzollerns had permanently established their rule in the Mark and set about subjecting to their own sway all independent powers still surviving. The Elector Frederick I. was still engaged principally with the recalcitrant local nobility, but his successor Frederick II. (1440-70) aimed at incorporating the large cities also more closely into his territory. He subdued Berlin and Kölln, although not without a sharp struggle, partly by exploiting the antagonisms existing within the cities themselves between the dominant families, the patricians, and the guilds of artisans. After his victory he deprived the cities of part of their old privileges, in particular of the right of concluding independent alliances with other towns. He built a fortress in Kölln on the site later occupied by the royal palace, and his successor made this spot his principal seat. From the end of the 15th century Berlin-Kölln was the permanent residence of the Hohenzollerns and the capital of the Electorate of Brandenburg.

In the 15th and 16th centuries the two towns were comparatively small in area and population. In 1654 their united population was only about 10,000. At that time also they played a comparatively subordinate part in the history of the Electorate and could not challenge any comparison with the wealth and repute of the great old commercial cities of Germany, such as Nuremberg, Augsburg, Strasburg, Frankfort or Cologne. They suffered severely, moreover, from sacks and forced levies during the Thirty Years' War.

It was only with the growing power of the Electors of Brandenburg from the 17th century onwards that the extent and importance of their place of residence began to grow likewise. The Great Elector, Frederick William (1640-88), laid out extensive fortifications, founded in the immediate neighbourhood

three more small towns, Friedrichswerder, Dorotheenstadt and Friedrichstadt, which soon amalgamated with the two older towns introducing good paving and lighting in the main streets. By settling here some of the Huguenots who had left France on account of the religious persecutions of Louis XIV. he brought into the population of the city important new elements, whose influence on commerce and industry was considerable. At the end of the 17th century there were over 5,000 French Huguenots in the area of the present Berlin, the total population being about 25,000. By completing the construction of the canal between the Spree and the Oder he opened up greater facilities for shipping and commerce.

His successor, Frederick I., the first king of Prussia, amalgamated the four towns into a single municipality, the city of Berlin, and, in the new palace built by Andreas Schlüter, gave it the first non-ecclesiastical building of any architectural importance. Almost adjoining this he built the Arsenal, laid out the plans on which this quarter of the modern town developed, and erected the beautiful monument to his father (by Schlüter) which is still one of the ornaments of Berlin. He encouraged education by founding the Academy of Science (*Akademie der Wissenschaften*). Under the two kings who succeeded him the city expanded in all directions. Frederick William I. had the old fortifications razed, thus making further expansion possible. Frederick the Great adorned the city with a number of new buildings, among which the Opera deserves chief mention. He also turned the Tiergarten into a large park. It was only under him that the transformation of Berlin into a modern great city began. The population, which had numbered about 70,000 at his accession, had risen by the end of the 18th century to 172,000. Even the temporary occupation of the town by the Austrians and the Russians during the Seven Years' War was unable to check its development.

Berlin passed through a difficult period at the beginning of the 19th century, when it was occupied by the French after the Battle of Jena and the King was obliged to transfer his seat temporarily to Königsberg, in Prussia. This was, however, only a short break, which was followed by a period of renewed and rapid prosperity after the fall of Napoleon and the restoration and enlargement of the state of Prussia. Berlin was now the capital of the second largest German state, the centre of a European world power, and as Prussia's influence over the development of Germany grew in the following decades, so did Berlin rise higher and higher above the other German towns. The foundation of the University in 1809 and the erection of the old Museum by Schinkel (1824-28) gave the town new centres for its intellectual life. By the middle of the 19th century the position of Berlin in Prussia was already such that, after the outbreak of the revolution of 1848, the course of the subsequent struggles were mainly determined by the sequence of events in Berlin.

Of decisive importance for the further development of Berlin was the construction of the German railway system, which began about the middle of the 19th century. As Berlin was the capital of Prussia, and after 1871 also of the German *Reich*, it was made the terminus or meeting point of the most important railway lines. The Borsig machinery factories which were established in the first half of the 19th century were the starting point of great industrial prosperity. The city expanded with incredible rapidity devouring one suburb after another. Including those suburbs which were either entirely incorporated or at least organically united with Berlin, topographically and economically, the population of the town was 198,000 in 1815, 330,000 in 1840, 548,000 in 1861 at William I.'s accession, 826,000 in 1871 at the foundation of the German Empire, 1,764,000 in 1890, 2,529,000 in 1900, 3,730,000 in 1910, 4,024,165 in 1926. In 1881 the local railway (*Stadtbahn*) was built, affording rapid connections from west to east. Splendid new buildings grew up, and gradually the centre of Berlin life was attracted more and more away from the old town, Unter den Linden, the Friedrichstrasse and the Leipzigerstrasse to the new western quarter, the streets round the Tauentzienstrasse and the Kurfürstendamm. At present Berlin ranks as the third city of the world.

BIBLIOGRAPHY.—There is no really good history of Berlin. O. Schwebel, *Geschichte der Stadt Berlin* (1888) is popular. See also F. Holtze, *Geschichte der Stadt Berlin* (1906) and *Geschichte der Stadt Berlin*, compiled by the "Verein für Geschichte Berlins" for the International Historical Congress, 1908 (bibl.). (E. BRA.)

BERLIN, a city of Coos county, New Hampshire, U.S.A., the metropolis of the northern part of the State, on the Androscoggin river, about 75m. N.W. of Portland. It is served by the Grand Trunk and the Boston and Maine railways. Its area is 57.8sq miles. The population was 8,886 in 1900; 16,104 in 1920, of whom over a third were foreign-born; and was estimated at 18,552 in 1925. It is in the heart of the White mountains, 16m. from the base of Mt. Washington. Immense water-power from the falls of the river and vast supplies of raw material in the forests of Quebec and northern New England have combined to favour the development of saw, pulp and paper-mills. The paper-mills, which make news-print, bond, and other varieties, are among the largest in the country. The output of the 17 manufacturing establishments in 1925 was valued at \$28,751,975. Berlin was settled in 1821, incorporated as a township in 1829, and chartered as a city in 1897.

BERLIN, a city of Green Lake county, Wisconsin, U.S.A.; on the Fox river, 84m. N.W. of Milwaukee; served by the Chicago, Milwaukee, St. Paul and Pacific railroad. The population in 1920 was 4,400. It is in an excellent dairy country and ships large quantities of milk. There are granite quarries near by. The city has a variety of manufactures, including gloves, shoes, leather products and fur coats.

BERLIN, a four-wheeled carriage with a separate hooded seat behind, detached from the body of the vehicle; so called from having been first used in Berlin. It was designed about 1670, by a Piedmontese architect in the service of the elector of Brandenburg. It was used as a travelling carriage, and Swift refers to it in his advice to authors "who scribble in a berlin". As an adjective, the word is used to indicate a special kind of goods, originally made in Berlin, of which the best known is Berlin wool. A Berlin warehouse is a shop for the sale of wools and fancy goods (*cf* Italian warehouse). The spelling "berlin" is also used by Sir Walter Scott for the "birlinn," a large Gaelic rowing-boat.

BERLIN, CONGRESS AND TREATY OF. The events that led up to the assembling of the Congress of Berlin, the outcome of which was the treaty of July 13, 1878, are described elsewhere (*see* EUROPE, *History*; TURKEY, *History*; RUSSO-TURKISH WAR). Here it must suffice to say that the object of the Congress was to revise the terms of the Treaty of San Stefano (March 3, 1878) by which the Russo-Turkish War had been ended and which seemed to make Russia permanently arbiter of the fate of the Balkan peninsula.

The Congress met, under the presidency of Prince Bismarck, at Berlin on June 13. The principal plenipotentiaries of the other Powers represented were Lord Beaconsfield and Lord Salisbury for Great Britain, Count Andrassy for Austria-Hungary, Prince Gorchakov for Russia, and Alexander Catheodory Pasha for Turkey. The basis of the conferences had, of course, been settled beforehand, and the final act of the Congress was signed on July 13.

The Treaty of Berlin consists in all of 65 articles, of which it will be sufficient to note those which have had a special bearing on subsequent international developments. So far as they affect the territorial boundaries fixed by the treaties of Paris and San Stefano it will be sufficient to refer to the sketch map in the article EUROPE: *History*. By Art. I Bulgaria was "constituted an autonomous and tributary principality under the suzerainty of H.I.M. the Sultan"; it was to have "a Christian government and a national militia." Art. II. fixed the boundaries of the new state. Arts. III to XII. provide for the election of a prince for Bulgaria, the machinery for settling the new constitution, the adjustment of the relations of the new Bulgarian Government to the Ottoman empire and its subjects (including the question of tribute). By Art. XIII. a province was formed south of the Balkans which was to take the name of "Eastern Rumelia," and was to remain "under the direct military and political control of H.I.M. the Sultan, under conditions of administrative autonomy." It was

to have a Christian governor-general. It is to be noted that the sultan retained the right of fortifying and occupying the Balkan passes (Art. XV.) and all his rights and obligations over the railways (Art. XXI.).

Art. XXV., which the events of 1908 brought into special prominence, runs as follows: "The provinces of Bosnia and Herzegovina shall be occupied and administered by Austria-Hungary. The government of Austria-Hungary, not desiring to undertake the administration of the sanjak of Novi-Bazar, . . . the Ottoman administration will continue to exercise its functions here. Nevertheless . . . Austria-Hungary reserves the right of keeping garrisons and having military and commercial roads in the whole of this part of the ancient vilayet of Bosnia."

By Art. XXVI. the independence of Montenegro was definitively recognized and by Art. XVIII. she received certain accessions of territory, including a strip of coast on the Adriatic, but under conditions which tended to place her under the tutelage of Austria-Hungary. By Art. XXXIV. the independence of Serbia was recognized, subject to conditions (as to religious liberty, etc.) set forth in Art. XXXV. Art. XXXVI. defined the new boundaries. By Art. XLIII. the independence of Rumania was recognized. Subsequent articles define the conditions and the boundaries. Arts. LII to LVII. deal with the question of the free navigation of the Danube. The Danube commission, on which Rumania was to be represented, was maintained in its functions (Art. LIII) and provision made for the further prolongation of its powers (Art. LIV).

Art. LVIII. ceded to Russia the territories of Ardahan, Kars and Batoum, in Asiatic Turkey. By Art. LIX "H.M. the emperor of Russia declares that it is his intention to constitute Batoum a free port, essentially commercial."

By Art. LXI "the Sublime Porte undertakes to carry out, without further delay, the improvements and reforms demanded by local requirements in the provinces inhabited by the Armenians, and to guarantee their security against the Circassians and Kurds." It was to keep the powers informed periodically of "the steps taken to this effect." Art. LXII made provision for securing religious liberty in the Ottoman dominions.

Finally, Art. LXIII declares that "the Treaty of Paris of March 30, 1856, as well as the Treaty of London of March 13, 1871, are maintained in all such of their provisions as are not abrogated or modified by the preceding stipulations."

For the full text of the treaty in the English translation see E. Hertslet, *Map of Europe by Treaty*, vol. iv. p. 2759 (No. 530); for the French original see *State Papers*, vol. lxxix. p. 749. (W. A. P.)

BERLIN DECREE, an order issued by Napoleon on Nov. 21, 1806, forbidding the importation of British goods, and even excluding from the harbours under his control any neutral vessel which had touched at a British port. (*See* CONTINENTAL SYSTEM.)

BERLIOZ, HECTOR (1803–1869), French musical composer, was born at Côte-Saint-André, near Grenoble, on Dec. 11, 1803. His father, a doctor in good practice, wished his son to follow the same profession, and Hector studied medicine for a time, though he disliked it intensely. He had no early formal musical education, though he studied harmony and counterpoint surreptitiously, but without much real profit until the hearing of a Haydn quartet gave him inspiration and understanding. He was sent to Paris in 1822 to complete his medical studies, and from there he announced his revolt to his father, who cut off supplies and left the young man to fend for himself. Meanwhile he had had some lessons in composition from Lesueur, then a professor at the Paris Conservatoire. He entered himself as a student in 1823, but found the teaching and the atmosphere alien to his rebellious genius. Lesueur seems to have been the only teacher for whom he felt genuine respect.

His life at this period was hard, and he had to support himself by singing in the chorus of the Théâtre Gymnase. He had composed a mass performed at the church of St. Roch, and now wrote other works including a cantata named *La Mort d'Orphée*, the ms. of which was only discovered in 1923; but none of them had any success. He left the Conservatoire in 1825, to devote himself to

a systematic study of the works of Beethoven, Gluck, Weber and other masters. Success came at last with his cantata, *La Mort de Sardanapale* (1830), for which he was awarded the *prix de Rome*. The terms of the prize provided for three years study abroad, the first two to be spent in Italy. There he wrote an overture to *King Lear*; *Le Retour à la vie*, a continuation of an earlier symphonic work, *Episode de la vie d'un artiste*, the lovely song, *La Captive* and other works. Before the two years were up he begged leave to return to Paris.

The reason was partly nostalgia for a city which he always dearly loved, though he found little appreciation there, and partly his passion for the famous Irish actress, Henrietta Smithson, who was then playing Shakespearian parts in Paris. The *Episode de la vie d'un artiste*, had been inspired by her, and the performance of this work, with its continuation, at the Paris Conservatoire in 1832 caused her to regard Berlioz more favourably than before. It also won the praise of Paganini, who said to the composer: "Vous commencez par où les autres ont fini." Berlioz married Henrietta in 1833. The union was by no means a happy one, and difficulties were aggravated by poverty. She was compelled by an accident to leave the stage, and no place as professor or conductor was available for Berlioz, in rebellion against the correctness of the French school and a pioneer of the romantic movement. He was obliged to support himself and his family by acting as musical critic, which left him little time for composition. Yet the period between his marriage with Henrietta and their stormy separation in 1840 was rich in production. To these seven years belong the dramatic symphonies, *Harold en Italie*, *Symphonie funèbre et triomphale*, and *Roméo et Juliette*; the opera *Benvenuto Cellini* (1837); and the *Requiem*, commissioned by the French Government for performance in memory of those who fell at Constantine, Algeria.

Berlioz was given the Legion of Honour, and began to write (1838) for the *Journal des Débats*, to which he contributed at intervals until 1863. There he conducted his polemic against the conservative critics of the day. But official musical Paris remained obdurate. He was invited to visit Germany, where Robert Schumann, who had analysed the *Episode* in the *Neue Zeitschrift für Musik*, had prepared the way for him. Henrietta declined to accompany him, and the miserable breach followed. Berlioz supported her until her death in 1854, but there was no renewal of affection. The visit to Germany was delayed until 1842, but was a triumphal success. In all the great musical centres Berlioz was received with enthusiasm. But in Paris he conducted the works of other composers. In 1846 his cantata, *La Damnation de Faust*, was played in Paris, but was coldly received. He paid visits to Austria (1845), Russia (1847), and England (four times between 1847-55), but recognition abroad did not compensate him for apathy at home. *Benvenuto Cellini* was played, at the invitation of Liszt, at Weimar in 1852, and in London in 1853; and the oratorio-trilogy, *L'Enfance du Christ* in Weimar in 1855. The *Hymne à la France* was written for an industrial exhibition in 1844; the *Damnation de Faust* in 1845; the *Te Deum* for the Paris Exhibition of 1855; the short opera, *Béatrice et Bénédict* was produced at Baden in 1862; and *Les Troyens à Carthage* had a short run at the Théâtre Lyrique in Paris in 1863.

After the death of his first wife in 1854, Berlioz married a mediocre singer, Martin Recio, who rather hindered than helped him, since she demanded leading parts in his productions. But he was inconsolable at her death in 1862. The failure of *Les Troyens* in 1863 was a further blow. He had a great reception in Vienna (1866) and St. Petersburg (1867), but his health was failing and he died in Paris in 1869. He had been admitted to the *Académie Française* in 1856, and in 1852 had received the one official post of his lifetime—the librarianship of the Conservatoire.

The human story of Berlioz places him among the great Romantics, and is interesting apart from his achievement of bringing romanticism into the domain of music. His *Mémoires* (begun in London in 1848 and finished in 1865) show him as a boy in despair over the despair of Dido, and his breath is taken away at Virgil's "Quaesivit coelo lucem ingemuitque reperta." At the age of 12 he is in love with "Estelle," whom he meets 50 years

afterwards. The scene is described by himself (1865) with minute fidelity—a scene which Flaubert must have known by heart when he wrote its parallel in the novel *L'Education sentimentale*. The man—old, isolated, unspeakably sad, with the halo of public fame burning round him—meets the woman—old also, a mother, a widow, whose beauty he had worshipped when she was 18. In a frame of chastened melancholy and joy at the sight of Estelle, Berlioz goes to dine with Patti and her family. Patti, on the threshold of her career, shows him unmistakable affection. What would he not have given for such a demonstration from Estelle! "I was enchanted," he writes, "but not moved. The fact is that the young, beautiful, dazzling, famous virtuoso who at the age of 22 has already seen musical Europe and America at her feet, does not win the power of love in me; and the aged woman, sad, obscure, ignorant of art, possesses my soul as she did in the days gone by, as she will do until my last day." The music of Berlioz disclosed something in addition to the pure romance of Schumann—something that places him nearer in kind to Wagner. The power of Beethoven's symphonies had made a deep impression on Berlioz in his youth, and the "poetical idea" in Beethoven's creations ran riot in his mind. He thus became one of the most ardent and enlightened pioneers of what is now known as "programme music." Technically he was a brilliant musical colourist, often extravagant, but with the extravagant emotionalism of genius. He was a master of the orchestra; indeed, his treatment of the orchestra and his invention of unprecedented effects of *timbre* give him a unique position in musical history; he had an extraordinary gift for the use of the various instruments, and himself propounded a new ideal for the force to be employed, on an enormous scale. The ideal orchestra sketched out in his *Traité d'Instrumentation* (1844) was of proportions which can only be described as gigantic. This work, hardly appreciated during his lifetime, has had great influence on the later composers of all schools; and sufficient testimony to its value is afforded by the fact that within recent years it has been translated into German and brought up to date by none other than Richard Strauss (Peters ed., 1906).

Among Berlioz's purely literary works may be mentioned especially the essays on Weber, Gluck and Beethoven in the *Voyage musical en Allemagne et en Italie* (1845), while others are *Soirées d'orchestre* (1853), *Les Grotesques de la musique* (1859) and *A travers chants* (1862).

The critical edition of the complete compositions of Berlioz (published by Breitkopf and Härtel) is in ten series. I. Symphonies. *Fantastique*, op. 14; *Funèbre et triomphale*, op. 15, for military band and chorus; *Harold en Italie*, op. 16, with viola solo; *Roméo et Juliette*, with chorus and soli. II. Overtures (ten, including the five belonging to larger works). III. Smaller instrumental works of which only the Funeral March for *Hamlet* is important. IV. Sacred music: the *Grande Messe des Morts*, op. 5; the *Te Deum*, op. 22; *L'Enfance du Christ*, op. 25, and four smaller pieces. V. Secular cantatas, including *Huit scènes de Faust*, op. 1; *Lélio, ou le retour à la vie*, op. 146 (sequel to *Symphonie fantastique*), and *La Damnation de Faust*, op. 24. VI. Songs and lyric choruses with orchestra, 2 vols. VII. Songs and lyric choruses with pianoforte, 2 vols., including arrangements of the orchestral songs. VIII. Operas: *Benvenuto Cellini*; *Les Troyens* (five acts in two parts, *La Prise de Troie* and *Les Troyens à Carthage*); Recitatives for the dialogue in Weber's *Freischütz*. IX. Arrangements, including the well-known orchestral version of Weber's *Invitation à la danse*. X. Fragments and new discoveries.

BIBLIOGRAPHY.—Adolphe Jullien's books on Berlioz, *Hector Berlioz, la vie et le combat* (1882) and *Hector Berlioz, sa vie et ses œuvres* (1888) first gave a careful account of the details of his life. Bosch, *Histoire d'un romantique: Berlioz* (3 vols., 1906-13); *Le Faust de Berlioz* (1910), and *Une Vie Romantique* (1920); R. Rolland, *Musiciens célèbres* (1909); W. H. Hadow, *Studies in Modern Music* (1st series, 1908); E. Newman, *Musical Studies* (1905); A. W. Locke, *Music and the Romantic Period in France* (1920).

BERM, edge, border of river, a narrow ledge of ground. In parts of Egypt the whole area reached by the Nile is included in the berm. In military phraseology the berm is the space between

the base of a rampart and the ditch, and was useful to prevent earth rolling into the ditch. As it formed a passage-way military engineers decided to discontinue its construction. A *Berm-bank* is the bank of a canal opposite the towing path.

BERMONDSEY, a metropolitan borough of London, England, bounded north and east by the Thames; south-east by Deptford, south-west by Camberwell, and west by Southwark. Pop. (1921) 119,452. The name appears in Domesday, the suffix designating the former insular, marshy character of the district, while the prefix is generally taken to indicate the name of a Saxon overlord, Beormund. Bermondsey was in favour with the Norman kings as a place of residence, and there was a palace here, perhaps from pre-Norman times. A Cluniac monastery was founded in 1082, and Bermondsey Cross became a favoured place of pilgrimage. The foundation was erected into an abbey in 1399, and Abbey Road recalls its site. It is a district of poor streets, inhabited by a labouring population employed in leather, textile, metal, chemical, electrical and other works, and in the docks and the wharves bordering the river. The parish of Rotherhithe or Redriff has long been associated with a seafaring population. A tunnel connecting it with the opposite shore of the river was opened in June 1908. The neighbouring Thames tunnel was opened in 1843, but, as the tolls were insufficient to maintain it, was sold to the East London Railway company in 1865. The Herold institute, a branch of the Borough polytechnic, Southwark, gives instruction in the leather trade. Southwark park, in the centre of the borough, is 63ac. in extent. The borough council consists of a mayor, nine aldermen and 54 councillors. Since 1918 Bermondsey sends two members to parliament, one for the Rotherhithe and the other for the West Bermondsey division. Area 1,500ac.

BERMUDA RIG, the lofty, triangular, or leg-of-mutton mainsail of modern racing yachts. The rig was used originally on the small craft of the Bermuda islands, where it had been brought to a high state of efficiency before it came into general use on yachts. In its original form it consisted of a tall mast, raking well aft, and a loose-footed sail with a sprit to hold it out instead of a boom. As developed for yacht use the mast was lengthened considerably, being well stayed, often with two sets of spreaders on the mast to obtain the desired strength, and the foot of the sail shortened. This was to give a long "leading edge" to the sail, the ratio of height (or hoist) to foot being sometimes as high as 2.5 to 1 on small yachts. On larger yachts the difficulty of properly staying extremely long masts has kept this ratio down, so that from 2 to 1 or 1.5 to 1 is more common in yachts over 50 ft long. The sail is very efficient on the wind, it being possible to get a more uniform surface than in a gaff sail, where the gaff and boom are at different angles due to the former swinging off more than the latter. Whether or not the rig is indigenous to Bermuda is not certain. It probably originated in Holland, whence England derived much of her sea lore. However, it has been used in Bermuda from the early days of that colony, and was also seen on Chesapeake bay, in the early days of the American Colonies. The sail, in its modified form, did not come into general use on yachts outside of Bermuda until after 1918. It is also sometimes called the marconi (*q v.*) or the jib-headed rig (H. L. St.)

BERMUDAS, a group of islands in the Atlantic ocean, forming a British colony, in 32°15' N. and 64°50' W., about 580m. E by S. from Cape Hatteras on the American coast. The group, consisting of small islands and reefs (which mark the extreme northern range of the coral-building polyps), is of oval form, measuring 22m. from N.E. to S.W.; the area about 20 square miles. The largest is Great Bermuda, or Main Island, 14m. long and about a mile in average width, enclosing on the east Harrington or Little sound, and on the west the Great sound, thickly studded with islets, and protected on the north by the islands of Watford, Boaz, Ireland and Somerset. The rest of the group, St. George, Paget, Smith, St. David, Cooper, Nonsuch, etc., lie north-east of Main Island and form a semicircle round Castle Harbour. The fringing cays which encircle the islands, especially on the north and west, leave a few fairly wide, deep passages.

Geology.—The Bermudas are composed of aeolian limestones (see **BAHAMAS**) forming irregular hills of some 200–250 feet. These limestones consist chiefly of blown shell-dust, very irregularly stratified, as is usually the case with such deposits. When freshly cut the rock is soft, but the action of the sea covers it with a hard crust and often destroys stratification. The surface is often irregularly honeycombed. The reefs are ridges of aeolian

The coinage consisted of silvered copper pieces, value 2d., 3d., 6d., and 1s., and was probably the first struck in North America

limestone plastered over with thin layers of corals and other calcareous organisms. The very remarkable "serpuline atolls" are encrusted with convoluted tubes of serpulæ and *Vermetus*, together with barnacles, mussels, nullipores, corallines and some true encrusting corals. They probably rest upon foundations of aeolian rock. The Bermudas were formerly much more extensive than now and they may possibly be upon the summit of a submerged volcano. There are evidences of small oscillations of levels, but none of great elevation or depression

Soil, Climate, etc.—The surface soil is a friable red earth, which is also found in ochreous strata throughout the limestone. It is generally mixed with vegetable matter and coral sand. There are no streams or wells of fresh water, which is supplied only by rain collected and stored in tanks. The climate is mild and healthy. The maximum temperature is about 87°, the minimum 49°, the mean annual 70°. The islands attract a large number of visitors annually from America. Vegetation is very rapid, and the soil is clad in a mantle of almost perpetual verdure. The commonest tree is the so-called "Bermuda-cedar," really a species of juniper, which furnishes timber for small vessels. The wood is strongly scented. The shores are fringed with mangrove; the prickly pear grows luxuriantly in the most barren districts; and sage bush springs up profusely. Citron, sour orange, lemon and lime grow wild; but apple and peach do not thrive. The loquat, introduced from China, grows well. The mild climate assists the growth of esculent plants and roots; and a considerable trade is carried on with New York, principally in onions, early potatoes, tomatoes and beetroot, together with lily bulbs and cut flowers. A fine quality of arrowroot is produced. The castor-oil plant and aloe, tobacco, coffee, indigo and cotton are also grown. Few

WARWICK FORT IN THE BERMUDAS, CONSTRUCTED IN 1614 BY RICHARD MORE, GOVERNOR OF THE ISLES AND COLONY IN 1612

sheep or oxen are reared in the colony; meat, as well as bread and most vegetables, comes from America. Indigenous mammals are very few, and the only reptiles are a small lizard and the green turtle. Birds, especially aquatic species, abound. Insects are comparatively few, but ants swarm destructively in the heat. Fish are plentiful and the whale-fishery was once an important industry, but fisheries as a whole are not developed

Towns and Administration.—St. George on St. George Island, founded 1794, incorporated 1797, was the capital till the senate and courts of justice were removed by Sir James Cockburn to the centrally-situated Hamilton. Hamilton, on the inner part of the Great sound, founded 1790, incorporated 1793, had a population of 3,000 in 1925. Ireland Island has the British Admiralty dockyard and naval establishment. The harbour of St. George can accommodate a vast fleet; but, till deepened by blasting, the entrance was too narrow. The Bermudas became an important naval and coaling station in 1869, when a large iron dry dock was towed across the Atlantic and placed in a secure position in St. George, while, owing to their important strategic

position in mid-Atlantic, the British Government maintains a strong garrison. The Bermudas are a Crown colony. The governor is assisted by an executive council of six crown nominees, a legislative council of nine similarly appointed, and a representative assembly of 36 members, of whom four are returned by each of nine parishes. The currency, formerly 12 shillings to the pound sterling, was assimilated to that of England in 1842. The English language is universal. The colony is in the bishopric of Newfoundland. In 1847 an educational board was established, and there are numerous schools; attendance is compulsory, but none of the schools are free. Government scholarships enable youths to be educated to compete for Rhodes scholarships at Oxford. The revenue has increased during the last ten years from about £100,000 to £248,500 in 1925. In that year imports were valued at £1,325,041 and exports at £166,020, the annual averages since 1916 being about £1,200,000 and £252,000 respectively. The local population was estimated at 27,741 in 1925, about half the number being white. The disparity between imports and exports may be explained by the expenditure of American tourists in the islands and by the reactions of Prohibition in the United States.

History.—The discovery of the Bermudas resulted from the shipwreck of Juan Bermudez, a Spaniard on a voyage from Spain to Cuba with a cargo of hogs, early in the 16th century. Henry May, an Englishman, was wrecked there in 1593, and Sir George Somers in 1609. Sir George, from whom the islands took the alternative name of Somers Islands, was the first to establish a

settlement. In 1612 the Bermudas were granted to an offshoot of the Virginia Company of 120 persons, 60 of whom, under Henry More, proceeded to the islands. The first staple export was tobacco, but the industry declined in the 18th century. In 1726 Bishop George Berkeley chose the Bermudas as the seat of his projected missionary establishment. The first newspaper, the *Bermuda Gazette*, was published in 1784.

BERNARD, SAINT (1090-1153), abbot of Clairvaux, was born at Fontaines, near Dijon, in France. His father, a knight named Tecelin, perished on crusade; and his mother Aleth, of the noble house of Mon-Bar, died while he was yet a boy. The lad's disposition directed him to the Church. His desire to enter a monastery was opposed by his relations, who sent him to study at Châlons in order to qualify for high ecclesiastical preferment. Bernard's resolution was not, however, shaken, and he joined the community which Robert of Molesmes had founded at Cîteaux in 1098, carrying with him his brothers and many of his relations

and friends. The little community, which had seemed on the point of extinction for lack of novices, thus gained a sudden new life, and grew so rapidly that it was soon able to send out offshoots. One of these daughter monasteries was Clairvaux, founded in 1115, and of this Bernard was appointed abbot.

Though nominally subject to Cîteaux, Clairvaux soon became the most important Cistercian house, owing to the fame and influence of Bernard. His saintly character and his power as a preacher soon drew crowds of pilgrims to Clairvaux. His miracles were noised abroad, and sick folk were brought to be healed by him. Before long the abbot was drawn into the affairs of the great world. When, in 1124, Honorius II. became pope, Bernard was already reckoned among the greatest of French churchmen; he now shared in important ecclesiastical discussions, and papal legates sought his counsel. Thus in 1128 he was invited by Cardinal Matthew of Albano to the synod of Troyes, where he obtained the recognition of the new order of Knights Templars, the rules of which he is said to have drawn up. The European importance of Bernard, however, began with the death of Pope Honorius II. (1130) and the disputed election that followed. In the synod convoked by Louis the Fat at Étampes in April 1130 Bernard successfully asserted the claims of Innocent II. against those of Anacletus II., and henceforth became the most influential supporter of his cause. While Rome itself was held by Anacletus, France, England, Spain and Germany declared for Innocent, who, though banished from Rome, was—in Bernard's phrase—"accepted by the world." The pope travelled from place to place, with the abbot of Clairvaux at his side; he stayed at Clairvaux itself, and he went with Bernard to parley with the emperor Lothair III at Liège.

In 1133, the year of the emperor's first expedition to Rome, Bernard was in Italy. He accompanied Innocent to Rome and successfully resisted the proposal to reopen negotiations with Anacletus, who, with the support of Roger of Sicily, was too strong to be coerced. Lothair, though crowned by Innocent in St. Peter's, could do nothing to establish him in the Holy See so long as his own power was sapped by his quarrel with the house of Hohenstaufen; so, in the spring of 1135, Bernard went to Bamberg and succeeded in persuading Frederick of Hohenstaufen to submit to the emperor. In June he was back in Italy, taking a leading part in the Council of Pisa, by which Anacletus was excommunicated. In northern Italy the effect of his preaching was immense; Milan itself surrendered to his eloquence, submitted to Lothair and to Innocent, and tried to force Bernard, against his will, into the vacant see of St. Ambrose. In 1137, the year of Lothair's last journey to Rome, Bernard was in Italy again, agitating with success against the antipope. Anacletus died on Jan. 25, 1138; on March 13 the cardinal Gregory was elected his successor, assuming the name of Victor. Bernard's crowning triumph was the abdication of the new antipope, the result of his personal influence, and he was now free to return to his monastery.

Clairvaux itself had meanwhile (1135-36) been transformed outwardly into a more suitable seat for an influence that overshadowed that of Rome. How great this influence was is shown by the outcome of Bernard's contest with Abélard (*q.v.*).

One result of Bernard's fame was the growth of the Cistercian order. Between 1130 and 1145, 93 monasteries in connection with Clairvaux were either founded or affiliated from other rules. In 1145 a former monk of Clairvaux—another Bernard, abbot of Acquae Silviae, near Rome, was elected pope as Eugenius III. This was a triumph for the order; to the world it was a triumph for Bernard, who complained that all who had suits to press at Rome applied to him, as though he himself had become pope. (*Ep.* 239.)

Having healed the schism within the Church, Bernard next attacked the enemy without. In Languedoc the preaching of Henry of Lausanne (*q.v.*) was drawing thousands from the faith. In June 1145 Bernard travelled in the south, and by his preaching did something to stem the flood of heresy. Far more important, however, was his activity in the following year, when, at the pope's command, he preached a crusade. The effect was extraor-

dinary. At the great meeting at Vézelay, on March 21, as the result of his sermon, King Louis VII. of France took the cross, together with a host of all classes. Bernard next travelled through northern France, Flanders and the Rhine provinces, everywhere rousing wild enthusiasm; at Spire, on Christmas day, he succeeded in persuading Conrad, king of the Romans, to join the crusade.

The lamentable outcome of the movement (*see* CRUSADES) was a hard blow to Bernard. The news of the disasters to the crusading host first reached him at Clairvaux, where Pope Eugenius, driven from Rome by the revolution associated with the name of Arnold of Brescia, was his guest. An effort was made to retrieve the disaster by organizing another expedition. At the invitation of Suger, abbot of St. Denis, Bernard attended the meeting at Chartres convened for this purpose, where he himself was elected to conduct the new crusade. He was saved from this task, for which he was wholly unfit, by the intervention of the Cistercian abbots, who forbade him to undertake it.

Bernard was now ageing, broken by his austerities and by ceaseless work, but his mental energy remained undimmed. He continued to take an active interest in ecclesiastical affairs, and his last work, the *De Consideratione*, shows no sign of failing power.

The age in which Bernard lived recognized in him the embodiment of its ideal, that of mediaeval monasticism. The world had no meaning for him save as a place of banishment and trial, in which men are but "strangers and pilgrims." (*Serm.* i., *Epiph.* n. 1; *Serm.* vii., *Lent.* n. 1); the way of salvation had been marked out once for all, and the function of theology was but to maintain the traditional landmarks. With the subtleties of the schools he had no sympathy, and the dialectics of the schoolmen quavered into silence before his terrible invective. Yet, within the limits of his mental horizon, his vision was clear. His life proves with what merciless logic he followed out the principles of the Christian faith, as he conceived it; and it is impossible to say that he conceived it amiss. For all his zeal he was by nature neither a bigot nor a persecutor. Even when preaching the crusade he interfered at Mainz to stop the persecution of the Jews. As for heretics, "the little foxes that spoil the vines," these "should be taken, not by force of arms, but by force of argument," though, if any heretic refused to be thus taken, he considered "that he should be driven away, or even a restraint put upon his liberty, rather than that he should be allowed to spoil the vines" (*Serm.* lxiv.). He was troubled by the mob violence which made the heretics "martyrs to their unbelief," but oblivious to the precedent of the Pharisees, he ascribed the steadfastness of these "dogs" in facing death to the power of the devil (*Serm.* lxvi. on Canticles ii. 15).

This is Bernard at his worst. At his best he displays a nobility of nature, a wise charity and a genuine humility, that make him one of the most complete exponents of the Christian life. Hence his enduring influence. The author of the *Imitatio* drew inspiration from him; the Reformers saw in him a mediaeval champion of their favourite doctrine of the supremacy of grace; his works have been reprinted in countless editions. This is perhaps due to the fact that the source of his own inspiration was the Bible. He was saturated in its language and in its spirit; and this saved him from the grosser aberrations of mediaeval Catholicism. He accepted the teaching of the Church as to the reverence due to Our Lady and the saints, but they were overshadowed in his mind by his idea of the grace of God and the moral splendour of Christ; "from Him do the Saints derive the odour of sanctity; from Him also do they shine as lights" (*Ep.* 464).

The cause of Bernard's popular success as a preacher can only imperfectly be judged by the sermons that survive. These were all delivered in Latin, evidently to congregations more or less on his own intellectual level. Like his letters, they are full of quotations from the Bible, and they have all the qualities likely to appeal to men of culture. "Bernard," wrote Erasmus in his *Art of Preaching*, "is an eloquent preacher, much more by nature than by art; he is full of charm and vivacity, and knows how to reach and move the affections." The same is even more true of the

letters. They are written on a large variety of subjects to people of the most diverse stations and types; and they help us to understand the adaptable nature of the man, which enabled him to appeal as successfully to the unlearned as to the learned.

Bernard's works fall into four categories.—(1) *Letters*, of great interest and value for the history of the period. (2) *Treatises*: (a) dogmatic and polemical, *De gratia et libero arbitrio*, (c. 1127) following the lines laid down by St. Augustine: *De baptismo aliisque quaestionibus ad mag. Hugonem de S. Victore: Contra quaedam capitala errorum Abaelardi ad Innocentem II.* (in justification of the action of the synod of Sens); (b) ascetic and mystical, *De gradibus humilitatis et superbiae*, his first work (c. 1121); *De diligendo Deo* (c. 1126); *De conversione ad clericos*, an address to candidates for the priesthood; *De Consideratione*, written c. 1148 at the pope's request for the edification and guidance of Eugenius III; (c) about monasticism, *Apologia ad Gulielmum*, written c. 1127 to William, abbot of St. Thierry; *De laude novae militiae ad milites templi* (c. 1132–36); *De precepto et dispensatione*, an answer to questions on monastic discipline addressed to him by the monks of St. Peter at Chartres (some time before 1143); (d) on ecclesiastical government, *De moribus et officio episcoporum*, written c. 1126 for Henry, bishop of Sens; the *De Consideratione* mentioned above; (e) a biography, *De vita et rebus gestis S. Malachiae, Hiberniae episcopi*, written at the request of the Irish abbot, Congan, with the aid of materials supplied by him, and important for the ecclesiastical history of Ireland in the 12th century. (3) *Sermons*. (4) *Hymns*. Many hymns ascribed to Bernard survive, e.g., *Jesu dulcis memoria*, *Jesus rex admirabilis*, *Jesu decus angelicum*, which are included in the Roman breviary. Many have been translated and are used in Protestant churches.

BIBLIOGRAPHY—St. Bernard's works were first published in anything like a complete edition at Paris in 1508, edited by André Bocard; the first critical and complete edition is that of J. Mabillon, *Sancti Bernardi opp.* etc. (1667, improved and enlarged in 1690, and again, by Massuet and Texier, in 1719), reprinted by J. P. Migne, *Patrolog. lat.* (1859). There is an English translation of Mabillon's edition, including, however, only the letters and the sermons on the Song of Songs, with the biographical and other prefaces, by S. J. Eales (London, 1889–95). See further Leopold Janaschek, *Bibliographia Bernardina* (Vienna, 1891).

The principal source for the life of St. Bernard is the *Vita Prima*, compiled by various contemporary writers. It is included in Migne, *Patrolog. lat.* cxxxv. pp. 225–416, which also contains the abridgments or amplifications, by later hands, of the *Vita Prima*, known as the *Vita Secunda*, *Tertia* and *Quarta*. For a critical study of these sources see G. Huffer, *Der heilige Bernhard von Clairvaux* (Münster, 1886), and E. Vacandard, *Vie de Saint Bernard* (1895).

Among modern works on St. Bernard are S. J. Eales, *St. Bernard, abbot of Clairvaux* (1890) ("Fathers for English Readers" series); R. S. Storrs, *Bernard of Clairvaux: the Times, the Man and His Work* (New York, 1893); Comte d'Haussonville, *Saint Bernard* (1906).

BERNARD, CHARLES DE, whose full name was **PIERRE MARIE CHARLES DE BERNARD DU GRAIL DE LA VILLETTE** (1804–1850), French writer, was born at Besançon. After studying for the law, and then taking to journalism, he was encouraged by Balzac (whose *La Peau de chagrin* he reviewed) to settle in Paris and write; and the result was a series of remarkable pictures of provincial society and the Parisian bourgeoisie. The best of these are *Le Noeud gordien* (1838), containing among other short stories *Une Aventure de magistrat*, from which Sardou drew his comedy of the *Pommes du voisin*; *Gerfaut* (1838), considered his masterpiece; *Les Ailes d'Icare* (1840); *La Peau du lion* (1841) and *Le Gentilhomme campagnard* (1847).

His *Oeuvres complètes* (1850) include also his poetry and two comedies written in collaboration with "Léonce" (C. H. L. Laurencot, 1805–62). In W. M. Thackeray's *Paris Sketch-book* ("On some fashionable French novels") there is an admirable criticism of Bernard. See also an essay by Henry James in *French Poets and Novelists* (1884).

BERNARD, CLAUDE (1813–1878), French physiologist, was born on July 12, 1813, in the village of Saint-Julien near Villefranche. He received his early education in the Jesuit school of that town, and then proceeded to the college at Lyons, which, however, he soon left to become assistant in a druggist's shop. His leisure hours were devoted to the composition of a vaudeville comedy *La Rose du Rhône*, and the success it achieved moved

him to attempt a prose drama in five acts, *Arthur de Bretagne*. At the age of 21 he went to Paris, armed with this play and an introduction to Saint-Marc Girardin, but the critic urged him to take up the study of medicine, and in due course he became interne at the Hôtel-Dieu. He worked under the great physiologist, F. Magendie, who was physician to the hospital, became his deputy in 1848, and in 1855 succeeded him as full professor. Some time previously he had been chosen the first occupant of the newly-instituted chair of physiology at the Sorbonne. There no laboratory was provided for his use, but Louis Napoleon, after an interview with him in 1864, remedied the deficiency, at the same time building a laboratory at the natural history museum in the Jardin des Plantes, and establishing a professorship, which Bernard left the Sorbonne to accept in 1868—the year in which he was admitted a member of the Institute. He died in Paris on Feb. 10, 1878, and was accorded a public funeral—an honour never before bestowed by France on a man of science.

Claude Bernard's first important work was on the functions of the pancreas gland, the juice of which he proved to be of great significance in the process of digestion. A second investigation (perhaps his most famous) was on the glycogenic function of the liver; in the course of this he was led to the conclusion, which throws light on the causation of diabetes, that the liver, in addition to secreting bile, is the seat of an "internal secretion," by which it prepares sugar at the expense of the elements of the blood passing through it. A third research resulted in the discovery of the vaso-motor system. While engaged, about 1851, in examining the effects produced in the temperature of various parts of the body by section of the nerve or nerves belonging to them, he noticed that division of the cervical sympathetic gave rise to more active circulation and more forcible pulsation of the arteries in certain parts of the head, and a few months afterwards he observed that electrical excitation of the upper portion of the divided nerve had the contrary effect. In this way he established the existence of vaso-motor nerves—both vaso-dilator and vaso-constrictor. The study of the physiological action of poisons was also a favourite one with him, his attention being devoted in particular to curare and carbon monoxide gas. The full exposition of his views, and even the statement of some of the original facts, can only be found in the 17 vols. of his published lectures. He also published *Introduction à la médecine expérimentale* (1865) and *Physiologie générale* (1872).

An English *Life of Bernard*, by Sir Michael Foster, was published in London in 1899.

BERNARD, JACQUES (1658–1718), French Protestant minister and publicist, settled in Holland, where he was pensionary minister of Gouda, then minister at Leyden, and from 1706 professor of philosophy and mathematics there. He published *Lettres historiques* from 1692 to 1698, after which date the work, which gave an account of contemporary events, was continued by others. He compiled vols. xx. to xxv. of the *Bibliothèque universelle*, begun by Le Clerc, and succeeded Bayle as editor of the *Nouvelles de la république des lettres* (1699–1710 and 1716–18). He also collected and edited the *Actes et négociations de la paix de Ryswic* (1698).

BERNARD, JEAN-JACQUES (1888–), French dramatist, born at Enghien on July 30, 1888. The son of Tristan Bernard, he was at first strongly influenced by the latter's mocking and sceptical humour. This is noticeable in his two one-act plays *Le Voyage à deux* and *La Joie du Sacrifice*, and still more in the collection of stories entitled *L'Épicière*, which he published in 1913. Probably during the World War J.-J. Bernard became aware of his true personality; his most marked characteristic is a subtle and sympathetic feeling for the secret sufferings of mankind—for pain which not merely shrinks from revealing itself to the outside world, but does not even always succeed in attaining to full consciousness of itself. *Le Feu qui reprend mal*, the play by which the author made his name, is typical in this respect. It gives a moving representation of the unconfessed retrospective jealousy which smoulders in the heart of a returned prisoner of war. Bernard's most significant plays are, however, *Martine* (1922), *L'Invitation au voyage* (1924) and *L'Âme en peine* (1926)—three

delicate character studies of women, which mark the principal stages in the development of the author's subtle and original talent. In his *L'Ame en peine* Bernard has perceived the possibility of an unconscious, inexplicable connection between souls destined never to be aware of one another, but between whom exists a scheme of vibrations leading to hidden interdependencies. He arrives at these conclusions by a profound research into the almost subconscious feelings which crystallize about a purely intellectual conception, having no tangible reality. His dialogue is remarkable for its restraint and precision, and has justly been compared with that of Marivaux. (G. M.)

BERNARD, JOHN HENRY (1860-1927), archbishop of Dublin, was born in India on July 27, 1860, the son of a civil engineer. He was educated privately, and at Trinity college, Dublin, of which he became a fellow. From 1888-1911, he was Archbishop King's lecturer in divinity. Dr. Bernard was a select preacher at Oxford and Cambridge on various occasions, and was closely associated with the English High Church Party. He became dean of St. Patrick's in 1902, and in 1911 bishop of Ossory. In 1915 he was translated to Dublin. Some time before his election to the see of Dublin, he had delivered an address to his synod, in which he called on churchmen to prepare for a newer and better Ireland, where a better understanding would be compelled by common sacrifice and common sorrow in the World War. During the troubles of the years that followed, Archbishop Bernard worked for the unity of Ireland, and in 1919 he became provost of Trinity, with the intention of giving almost the whole of his time and energy to the reorganization of the university. He was the author of the *Liber Hymnorum*, a collection of Irish hymns, of *Notes and Commentaries on the Pastoral Epistles*, and an edition of Kant's *Critical Philosophy*. Bernard died on Aug. 29, 1927.

BERNARD, MONTAGUE (1820-1882), English international lawyer, the descendant of a Huguenot family, was born at Tibberton Court, Gloucestershire, and educated at Sherborne school and Trinity college, Oxford, being called to the bar at Lincoln's Inn in 1846. He was interested in legal history and in Church questions, and was one of the founders of the *Guardian*. In 1852 he was elected to the new professorship of international law and diplomacy at Oxford, where he undertook a good deal of non-collegiate work. He was a member of several royal commissions; in 1871 he went as one of the high commissioners to the United States, and signed the treaty of Washington, and in 1872 he assisted Sir Roundell Palmer before the tribunal of arbitration at Geneva. In 1874 he resigned his professorship, but as member of the University of Oxford commission of 1876 he was mainly responsible for bringing about the compromise between the university and the colleges. Bernard's reputation as an international lawyer was widespread, and he was an original member of the Institut de Droit International (1873). His published works include *An Historical Account of the Neutrality of Great Britain during the American Civil War* (1870), and lectures on international law and diplomacy.

BERNARD OF CHARTRES (d. c. 1130), not to be confused with Bernard of Tours (*Silvestris*), was a scholastic philosopher, described by John of Salisbury as *perfectissimus inter Platonicos nostri saeculi*. About 1117, he was teaching at Chartres, which was then the centre of Platonism and Humanism. In 1119 he became chancellor of the Church of Chartres. Bernard left no writings, but from the *Metaphysics* of John of Salisbury we know that he was deeply interested in the study of the classics and that he was a Platonic realist. Apart from God and the Divine ideas, he held that the original principles of all things were created matter and *formae naturae*, the latter being meant as a reconciliation between Plato and Aristotle. William of Conches and Gilbert de la Porree were friends of Bernard. (See SCHOLASTICISM.)

Thought* (1920) and "The Masters of the Schools at Paris and Chartres" in *Eng. Hist. Rev.* (1920); Hauréau, *Hist. de la Philos. Scol.*, 1 and *Mémoires de l'Académie des Inscriptions* (1884).

BERNARD, SIMON (1779-1839), French general of engineers, was born at Dôle, educated at the École Polytechnique, and entered the army in the corps of engineers. He rose rapidly, and served (1805-12) as aide-de-camp to Napoleon. After the emperor's fall he emigrated to the United States, where, being made a brigadier-general of engineers, he executed extensive military works for the Government, notably at Fortress Monroe (Va.), and around New York, and did a large amount of the civil engineering connected with the Chesapeake and Ohio canal and the Delaware breakwater. He returned to France after the revolution of 1830, was made a lieutenant-general by Louis Philippe, and in 1836 served as minister of war.

BERNARD, TRISTAN (1866-), French dramatist and novelist, was born in Besançon on Sept. 17, 1866. Before he began to write plays he published stories, sketches, etc., in the *Revue Blanche* and in various short-lived periodicals on which his writings conferred temporary popularity. His first dramatic writings were one-act comedies; *Le Fardeau de la Liberté* (1897), *Le seul Bandit du Village* (1898), *L'Anglais tel qu'on le parle* (1899), *Daisy* (1902), etc., which owe their value to a unique mixture of broad, vaudeville comedy and mocking humour. His dramatic production, which was abundant, must be divided into two classes; it includes amusing vaudevilles such as *Le Danseur Inconnu* (1907), *Le Petit Café* (1911) and *Les Deux Canards* (1913), and satires of a more ambitious character, in which mordant irony and relentless observation not only of the absurdities of the bourgeoisie, but human weakness in all its forms, is expressed in classic and close-knit dialogue. The most remarkable examples of the second class are *Monsieur Codomat* (1907), *Le Prince Charmant* (1914) and *La Volonté de l'Homme* (1917). *Triplepatte*, one of his most successful plays, occupies an intermediate place between the two series. Since the war Tristan Bernard has mainly written vaudevilles. Mention must not be omitted of his two novels, *Les Mémoires d'un Jeune Homme Rangé* (1899) and its sequel *Le Mari Pacifique* (1901). The mediocrity and weakness of will of the present generation have perhaps never been more mercilessly analysed.

BERNARDIN OF SIENA, ST. (1380-1444), Franciscan preacher, was born of a noble family. His parents died in his childhood, and on the completion of his education, he spent some years in the service of the sick in the hospitals and thus caught the plague, of which he nearly died. In 1402 he entered the Franciscan order in the strict branch called Observant, of which he became one of the chief promoters (see FRANCISCANS). Shortly after his profession, the work of preaching was laid upon him, and for more than 30 years he preached with wonderful effect all over Italy, and played a great part in the religious revival of the beginning of the 15th century. In 1437 he became vicar-general of the Observant branch of the Franciscans. He refused three bishoprics. He died in 1444, and was canonized in 1450.

The first edition of his works, for the most part sermons, that, in a striking manner, reflect the life of the people, was printed at Lyons in 1501; later ones in 1636, 1650, and 1745. Specimens are to be found in Miss A. Harrison's *Examples of S. Bernardino* (1926). His life will be found in the Bollandists; a good modern biography has been written by Paul Thureau-Dangin (1896), and translated into English by Gertrude von Hügel (1911).

BERNAU bei BERLIN, a town in the north-east of the district of Berlin in the Prussian province of Brandenburg. Pop. (1925) 9,938. Cabinet-making is practised and general suburban industries (gloves, silk, buttons, etc.) are carried on.

BERNAUER, AGNES (d. 1435), daughter of an Augsburg baker, was secretly married about 1432 to Albert (1401-60), son of Ernest, duke of Bavaria-Munich. Ignorant of the marriage, Ernest urged his son to marry and reproached him with his connection with Agnes. Albert then declared she was his lawful wife; and subsequently, during his absence, she was seized by order of Duke Ernest and condemned to death for witchcraft. On Oct. 12, 1435, she was drowned in the Danube near Straubing. This story lived long in the memory of the people, and has afforded material for several dramas. Adolf Böttger, Friedrich Hebbel and Otto Ludwig have each written a play entitled *Agnes Bernauer*.

BERNAY, town of France, capital of an arrondissement, department of Eure, on the left bank of the Charentonne, 31m. W.N.W. of Evreux, on the railway between that town and Lisieux. Pop. (1926) 6,038. Bernay grew up round the Benedictine abbey founded by Judith of Brittany in 1013, and early in the 13th century was the seat of a viscount. The town was besieged by du Guesclin in 1378; it was taken several times by the English during the first half of the 15th century, and by de Coligny in 1503. The fortress was razed in 1589. The Abbey church underwent restoration in the 17th century and now serves for municipal and legal purposes. The church of Ste Croix dates from the 14th and 15th centuries; that of Notre Dame de la Couture, which preserves some good stained glass, from the 14th, 15th and 16th centuries. The region is well wooded and the town contains many wooden houses. The surrounding woods were sold to the British Government during the World War. Among the industrial establishments of the place are manufactories of cotton and woollen goods, bleacheries and dye-works. Large numbers of Norman horses are sold in Lent, at the fair known as the *Foire fleurie*.

Bernay has a sub-prefecture, tribunals of commerce and of first instance, and a board of trade arbitration.

BERNAYS, JAKOB (1824–1881), German philologist and philosophical writer, was born at Hamburg, of Jewish parents, on Sept. 11, 1824, and died at Bonn, May 26, 1881. Jakob studied from 1844 to 1848 at Bonn under Ritschl. In 1853 he accepted the chair of classical philology at the Jewish Theological college at Breslau, where he formed a friendship with Mommsen. In 1866, Bernays returned to Bonn as extraordinary professor and chief librarian.

His chief works, which deal mainly with the Greek philosophers, are—*Die Lebensbeschreibung des J. J. Scaliger* (1855); *Über das Phokylidische Gedicht* (1856); *Die Chronik des Sulpicius Severus* (1861); *Die Dialoge des Aristoteles im Verhältniss zu seinen übrigen Werken* (1863); *Theophrastus' Schrift über Frommigkeit* (1866); *Die Heraklitischen Briefe* (1869); *Lucian und die Cyniker* (1879); *Zwei Abhandlungen über die Aristotelische Theorie des Dramas* (1880). The last of these was a re-publication of his *Grundzüge der verlorenen Abhandlungen des Aristoteles über die Wirkung der Tragödie* (1857), which aroused considerable controversy. See notices in *Biographisches Jahrbuch für Alterthumskunde* (1881), and *Allgemeine deutsche Biographie*, xlvii. (1902); art. in *Jewish Encyclopaedia*; also Sandys, *Hist. of Class. Schol.* iii. 176 (1908).

MICHAEL BERNAYS (1834–1897), brother of the above, was born at Hamburg on Nov. 27, 1834, and died at Carlsruhe on Feb. 25, 1897. He was a professor at Leipzig and (1873–99) at Munich.

Among his principal works are *Zur Kritik und Geschichte des Goetheschen Textes* (1866), *Briefe Goethes an G. A. Wolf* (1868); *Zur Entstehungsgeschichte des Schlegelschen Shakespeares* (1872); an introduction to Hirzel's collection entitled *Der junge Goethe* (1875); a revised edition of Voss's translation of the *Odyssey*, etc. From his literary remains were published *Schriften zur Kritik und Literaturgeschichte* (1895–99). A collection of his letters was published in 1907.

BERNBURG, a town in the Free State of Anhalt, Germany, on the Saale, half-way between Halle and Magdeburg, formerly the capital of the duchy of Anhalt-Bernburg. Pop. (1925) 34,333. It consists of four parts, the Altstadt or old town, the Bergstadt (hill town), the Neustadt (new town) and the suburb of Waldau. The Bergstadt, which contains the moated castle, formerly the ducal residence, was fortified by Otto III. in the 10th century. The new town was founded in the 13th. For a long period the different parts were under separate municipalities, the new town uniting with the old in 1560, and the Bergstadt with both in 1824. Prince Frederick removed the ducal residence to Ballenstedt in 1765. Bernburg produces agricultural machinery, salt and saltpetre, paper and cardboard, and has chemical and lead-smelting works. Market-gardening is also extensively carried on, and there is a large river traffic in agricultural produce.

BERNCASTEL-CUES, town, Rhine province, Germany, on a bend of the winding Moselle, north-east of Trier. Pop. (1925) 4,492. It originally belonged to the chapter of Trier and has a ruined castle. It is a famous centre of wine production.

BERNE, the largest of the Swiss cantons, after Grisons. It extends from beyond the Jura to the snow-clad ranges over against the Valais. Area, 2,657 sq.m., of which over 100 sq.m. are occupied by glaciers. It is mainly watered by the river Aar (*q.v.*), with its

affluents, the Saane (left) and the Emme (right); the Aar forms the two lakes of Brienz and Thun (*q.v.*). Three divisions are usually distinguished: (1) The *Oberland* or highlands, which includes the snowy Alps culminating in the Finsteraarhorn, 14,026 ft., and the Jungfrau, 13,669 ft., as well as the famous summer resorts of Grindelwald, Mürren, Interlaken, Meiringen, Kandersteg, Thun and the fine pastoral valley of the Simme. (2) The *Mittelland* or midlands, comprising the valley of the Aar below Thun, that of the Emme, the outliers of the high Alps and the open country around the town of Berne. (3) The *Seeland* (lakeland) and the Jura, extending from Bienne across the Jura to Porrentruy, in the extreme north-west of Switzerland. The Oberland and Mittelland form the "old" canton, the Jura having been acquired only in 1815, and differing from the rest of the canton in being French-speaking and Roman Catholic. The population, mainly German-speaking Protestants, numbered 692,200 (estimated) in 1925. The capital is Berne (*q.v.*), while the other important towns are Bienne, Burgdorf, Delsberg (Delémont), Porrentruy, Thun and Langenthal (*q.v.*). The canton is divided into 30 administrative districts, and contains 507 communes. The existing constitution dates from 1893, but in 1906 the direct popular election of the executive of nine members (hitherto named by the legislature) was introduced. The legislature or *grossrat* is elected for four years (like the executive). The *obligatory referendum* obtains in the case of all laws, and of decrees relating to an expenditure of over half a million francs, while 12,000 citizens have the right of *initiative* in the case of legislative projects, and 15,000 may demand the revision of the cantonal constitution. The two members sent by the canton to the federal *ständerrat* (Council of States) are elected by the *grossrat*, while the 34 members sent, on the basis of the census of 1920, to the federal *nationalrat* (national council) are chosen by a popular vote.

In the Alpine portions of the canton the breeding of cattle is the chief industry; next come the elaborate arrangements for summer travellers (the *Fremdenindustrie*). The cheese of the Emme valley is locally much esteemed. Other industries in the Alpine region are wood-carving (at Brienz) and wine manufacture (around Lakes Bienne and Thun). The *Mittelland* is mainly agricultural. Watchmaking is the principal industry of the Jura, Bienne and St. Imier being the chief centres of this industry. Iron mines are also worked in the Jura, while the Heimberg potteries, near Thun, produce a locally famous ware, and there are quarries and tile factories.

The canton of Berne is composed of the various districts acquired by the town of Berne (*q.v.*). The more important, with dates of acquisition, are the following: Laupen (1324); Hasli and Meiringen (1334); Thun and Burgdorf (1384); Unterseen and the Upper Simme valley (1386); Frutigen, etc. (1400); Lower Simme valley (1439–49); Interlaken, with Grindelwald, Lauterbrunnen and Brienz (1528, on the suppression of the Austin Canons of Interlaken); Saanen or Gessenay (1555); Köniz (1729), and the Bernese Jura with Bienne (1815, from the bishopric of Basle). But certain regions previously won were lost in 1798: Aargau (1415); Aigle and Grandson (1475); Vaud (1536); and the Pays d'En-Haut or Château d'Oex (1555). From 1798 to 1802 the *Oberland* formed a separate canton (capital, Thun) of the Helvetic republic. From 1803 to 1814 the canton of Berne was one of the six "directorial" cantons of the confederation.

BERNE, capital of the Swiss canton of the same name (Ger *Bern*; Ital. *Berna*), and political capital of the Swiss confederation, picturesquely situated on a peninsula, 1,800 ft. above sea, surrounded, save on the west, by the river Aar. Five lofty bridges cross the river, leading to the extensive residential quarters. The existence of the ancient castle of Nydeck, at the eastern end of the peninsula, guarding the passage over the Aar, probably induced Berchtold V., duke of Züringen, to found Berne in 1191 as a military post on the frontier between the Alamanni (German-speaking) and the Burgundians (French-speaking). Thrice the walls which protected the town were moved westwards, in 1256, 1346 and 1622. After the extinction of the Züringen dynasty (1218) Berne became a free imperial city. Its independence was finally secured by the victories of Dornbühl (1298) over Fribourg

and the Habsburgs and of Laupen (1339) over the neighbouring Burgundian nobles. In 1353 it entered the Swiss confederation as its eighth member. It soon took the lead in the confederation. In 1528 Berne accepted the religious reformation, and henceforth became one of its chief champions in Switzerland. In the 18th century the town governed 52 bailiwicks (acquired between 1324 and 1729), the Bernese patricians being thus extremely powerful. Two attempts to break down this monopoly, in 1723 and 1749, failed, but the whole system was swept away by the French in 1798, and, though partially revived in 1815, came to an end in 1831. From 1815 to 1848 it shared with Zürich and Lucerne the supreme rule (which shifted from one to the other every two years) in the Swiss confederation, while in 1848 a Federal law made Berne the sole political capital. Pop. (1928) 109,900. In 1920, out of a population of 104,626, German-speaking inhabitants numbered 95,995, while 89,656 were Protestants, 12,225 Catholics and 1,039 Jews. The arcades (*Lauben*) of the old town, and the numerous elaborately ornamented fountains, are noteworthy, as well as the two remaining towers of the old walls of the *Käfigturm* and the *Zeitglockenturm* (famous for its 16th-century clock). The principal mediaeval building in Berne is the (now Protestant) *Münster*, begun in 1421 though not completed till 1611. The tower, rising conspicuously above the town, was restored in 1889-93. The Federal Houses of Parliament (*Bundeshaus*) date in their oldest portion from 1852-57; in the east wing from 1888-92. The central part with the session rooms was built in 1894-1902. This group of buildings, occupying a remarkable site on the edge of the bluff above the Aar, also contains the offices of the Federal executive and administration, besides the central seat of the National Bank (created in 1907). The town hall dates from 1406, while some of the houses belonging to the old guilds are of interest. The town library (with which the university library was incorporated in 1905) contains many mss. and rare printed books. Museums include the historical (archaeological and mediaeval), the natural history, the art (mainly modern Swiss pictures), and the Alpine (in which are collections relating to the Swiss Alps). The University of Berne, founded in 1834, had 1,500 students in 1925-26. The old fortifications (*Schanzen*) have been converted into promenades, which command wonderful views of the snowy Alps of the Bernese Oberland. Just across the Nydeck bridge is the famous bear pit. Bears, which are supposed to have given the town its name, have been maintained there since 1513; certainly a bear is shown on the earliest known seal (1224). The industries of Berne include chocolate-making and engine-building. Its main activities are political and administrative, and it has become the seat of various international associations (postal, telegraph, railway, copyright, etc.).

BERNERS, JOHN BOURCHIER, 2ND BARON (c. 1469-1533), English translator of Froissart and one of the founders of the Tudor prose style, was born probably at Tharfield, Hertfordshire, England. His father was killed at Barnet in 1471, and he inherited his title in 1474 from his grandfather, John Bouchier, who was a descendant of Edward III. In 1484 he was implicated in a premature attempt to place Henry, duke of

Richmond (afterwards Henry VII.), on the throne, and fled in consequence to Brittany. In 1497 he helped to put down an insurrection in Cornwall and Devonshire, raised by Michael Joseph, a blacksmith, and from this time was in high favour at court. He accompanied Henry VIII. to Calais in 1513, and was a captain of pioneers at the siege of Thérouanne. In the next year he was again sent to France as chamberlain to the king's sister Mary on her marriage with Louis XII, but he soon returned to England. In 1516 he became lord chancellor. In 1518 he was sent to Madrid to negotiate an alliance with Charles of Spain. He sent letters to Henry chronicling the bull-fights and other doings of the Spanish Court, and to Wolsey complaining of the expense to which he was put in his position as ambassador. In the next year he returned to England, and with his wife Catherine Howard, daughter of the duke of Norfolk, was present in 1520 at the Field of the Cloth of Gold. But his affairs were greatly embarrassed. Perhaps in the hope of repairing his fortune, he accepted the office of deputy of Calais, where he spent the rest of his life in comparative leisure, though still harassed by his debts, and died on March 16 1533.

His translation of *Syr Johan Froysart of the Cronycles of England, France, Spayne, Portyngale, Scotland, Bretayne, Flaunders; and other places adjoynynge*, was undertaken at the request of Henry VIII., and was printed by Richard Pynson in two volumes dated 1523 and 1525. Two romances from the French followed: *The Boke of Duke Huon of Burdeux* (printed 1534? by Wynkyn de Worde, reissued and modernized in 1601), and *The Hystory of the Moost noble and valyaunt knight Arthur of lytell brytayne* (ed. E. V. Utterson 1814). His other two translations, *The Castell of Love* (printed 1540) from the *Carcel de Amor* of Diego de San Pedro, and *The Golden Boke of Marcus Aurelius* (completed six days before his death, printed 1534), from a French version of Antonio Guevara's book, are in a different manner. *The Golden Boke* gives Berners a claim to be a pioneer of Euphuism, although Lyly was probably acquainted with Guevara not through his version, but through Sir Thomas North's *Dial of Princes*, in which the new style was much better developed. *The Golden Boke* was the most popular of all Berners's translations, and went through 14 editions in the next 50 years. It caught the fashionable taste of the time.

A biographical account of Berners is to be found in Sir Sidney Lee's introduction to *Huon of Burdeux* (Early English Text Society, 1882-87). Among the many editions of his translation of Froissart may be mentioned that in the "Tudor Translations" (1901), with an introductory critical note by Professor W. P. Ker. See also a smaller edition (1805) by G. C. Macaulay, and Baron Kervyn de Letterhove's *Froissart* (1857).

BERNERS, BARNES or BERNES, JULIANA (b. 1388?), English writer on hawking and hunting, is said to have been prioress of Sopwell nunnery near St. Albans, and daughter of Sir James Berners, who was beheaded in 1388. The only documentary evidence regarding her, however, is the statement at the end of her treatise on hunting in the *Boke of St. Albans*, "Explicit Dam Julyans Barnes in her boke of huntynge" (edition of 1486), and the name is changed by Wynkyn de Worde to "dame Julyans Bernes." There is no such person to be found in the pedigree of the Berners family, and there is a gap in the records of the priory of Sopwell between 1430 and 1480.

The first and rarest edition was printed in 1486 by an unknown schoolmaster at St. Albans. Wynkyn de Worde's edition (folio 1496) was adorned by three woodcuts and included a "Treatyse of fysshynge wyth an Angle," not contained in the St. Albans edition. It contains three treatises, on hawking, hunting, and heraldry. That on heraldry is derived mainly from a work (1441) by Nicholas Upton, and those on hawking and hunting mainly from an early 14th century work on *Venerie de Twety*.

J. Haslewood, who published a facsimile of the edition of Wynkyn de Worde (1811, folio), with a biographical and bibliographical notice, examined the author's claims. He assigned to her little else in the *Boke* except part of the treatise on hawking and the section on hunting. An older form of the treatise on fishing was edited in 1883 by T. Satchell from a ms. in possession of Mr. A. Denison. A facsimile, entitled *The Book of St. Albans*,

with an introduction by William Blades, appeared in 1881. During the 16th century the work was very popular, and was many times reprinted.

BERNHARD OF SAXE-WEIMAR, DUKE (1604–1639), a celebrated general in the Thirty Years' War, the eleventh son of John, duke of Saxe-Weimar, was born in Weimar on Aug. 16 1604. At the outbreak of the Thirty Years' War he took the field on the Protestant side. When Gustavus Adolphus landed in Germany Bernhard joined him, and for a short time he was colonel of the Swedish life guards. After the battle of Breitenfeld he accompanied Gustavus in his march to the Rhine, and between this event and the battle of the Alte Veste Bernhard commanded numerous expeditions in almost every district from the Moselle to Tirol. At the Alte Veste he displayed the greatest courage, and at Lützen, when Gustavus was killed, Bernhard immediately assumed the command, killed a colonel who refused to lead his men to the charge, and finally by his furious energy won the victory at sundown. At first as a subordinate to his brother William, who as a Swedish lieutenant-general succeeded to the command, but later as an independent commander, Bernhard continued to push his forays over southern Germany; and with the Swedish General Horn he made in 1633 a successful invasion into Bavaria, which was defended by the imperialist general Arldinger. In that year he acquired the duchy of Würzburg, installing one of his brothers as *Stadthalter* and returning to the wars. A stern Protestant, he exacted heavy contributions from the Catholic cities which he took, and his repeated victories caused him to be regarded by German Protestants as the saviour of their religion. But in 1634 Bernhard suffered the great defeat of Nördlingen, in which the flower of the Swedish army perished. In 1635 he entered the service of France, which had intervened in the war. In his great campaign of 1638 he won the battles of Rheinfelden, Wittenweiher, and Thann and captured successively Rheinfelden, Freiburg, and Breisach, the last reputed one of the strongest fortresses in Europe. Bernhard had in the first instance received definite assurances from France that he should be given Alsace and Hagenau, Würzburg having been lost in the *débâcle* of 1634, and he hoped to make Breisach the capital of his new duchy. But he died on July 18 1639, at the beginning of the campaign, and the governor of Breisach was bribed to transfer the fortress to France. The duke was buried at Breisach, his remains being subsequently removed to Weimar.

See J. A. C. Hellfeld, *Geschichte Bernhards des Grossen, Herzogs v. Saxe-Weimar* (Jena, 1747); B. Röse, *Herzog Bernhard d. Grosse von Saxe-Weimar* (Weimar, 1828–29); Droysen, *Bernhard v. Weimar* (Leipzig, 1885).

BERNHARDI, FRIEDRICH VON (1840–), German soldier and writer, was born in St. Petersburg, Nov. 22, 1849, the son of the diplomat, Theodor von Bernhardi (1802–1887), and he entered the German army in time to take part in the Franco-Prussian War. From 1891 to 1894 he was German military attaché at Berne, and later he took charge of the military history department of the General Staff in Berlin. In 1907 he was given command of the VII Army Corps, but he retired in 1909 and turned his whole attention to writing on military subjects. Following Treitschke, Bernhardi held that war must come, that Germany must conquer or fall and that she is entitled therefore to secure victory at any cost. His gospel of force, thus proclaimed outside his own country, was a factor (possibly exaggerated at the time) in creating a belief that Germany was in an aggressive mood. His chief book was *Deutschland und der nächste Krieg* (1912), the translation of which into English caused a great sensation. In 1915 he served on the eastern front, but in 1918 received a command in the west, and took part in the battle of Armentières. After the World War, in 1921, he published *Deutschlands Heldenkampf 1914–18*.

BERNHARDT, SARAH (ROSINE BERNARD) (1845–1923), French actress, was born in Paris on Oct. 22 1845, of mixed French and Dutch parentage, and of Jewish descent. She was, however, baptized at the age of 12 and brought up in a convent. At 13 she entered the Conservatoire, where she gained the second prize for tragedy in 1861 and for comedy in 1862. Her

début was made at the Comédie Française on Aug. 11 1862, in a minor part in Racine's *Iphigénie en Aulide*. In 1867 she made her first definite successes at the Odéon, as Cordelia in a French translation of *King Lear*, as the queen in Victor Hugo's *Ruy Blas*, and above all, as Zanetto in François Coppée's *Le Passant* (1869). After the Franco-German War she left the Odéon for the Comédie Française. From that time she steadily increased her reputation, especially by her performances of *Phèdre* in Racine's play (1874) and of *Dona Sol* in Victor Hugo's *Hernani* (1877). In 1879 she had a famous season at the Gaiety in London. By this time her position as the greatest actress of her day was securely established. Her power of emotional acting, the magnetism of her personality and the beauty of her *voix d'or*, made the public tolerant of her caprices. In 1880, after a breach with the Comédie Française, she began her series of world tours. She went first to London, and in 1880 and 1881 to Denmark, America, and Russia, with *La Dame aux Camélias* as the principal attraction. In 1882 she married Jacques Damala, but separated from him at the end of the following year. There was one son of the marriage, Maurice Bernhardt. After a fresh triumph in Paris with Sardou's *Fédora* at the Vaudeville she became proprietress of the Porte St. Martin, where she produced, among other plays, Jean Richepin's *Nana Sahib* (1883), Sardou's *Théodora* (1884) and *La Tosca* (1887), Jules Barbier's *Jeanne d'Arc* (1890) and Sardou and Moreau's *Cléopâtre* (1890).

She made several tours, including visits to America in 1886–87 and 1888–89. Between 1891 and 1893 she again visited America (North and South), Australia, and the chief European capitals. In Nov. 1893 she opened the Renaissance with *Les Rois* by Jules Lemaître, which was followed by *Sylvestre* and Morand's *Iseult* (1894), Sardou's *Gismonda* (1894) and Edmond Rostand's *La Princesse lointaine* (1895). In 1895 she also appeared with conspicuous success as Magda in a French translation of Sudermann's *Heimat*. For the next few years she visited London almost annually, and America in 1896. In that year she made a success with an adaptation of Alfred de Musset's *Lorenzaccio*. In Easter week of 1897 she played in a religious drama, *La Samaritaine*, by Rostand. In Dec. 1896 a fête was organized in Paris in her honour. Early in 1899 she removed to the Théâtre des Nations, a larger house, which she opened with a revival of *La Tosca*. In the same year she made the experiment of a French production of *Hamlet*, in which she took the title part. And in 1900 she played the Duc de Reichstadt in Rostand's *L'Aiglon*. Of the successful productions of her later years perhaps none was more remarkable than her impersonation of La Tisbé in Victor Hugo's romantic drama *Angelo* (1905). In Jan. 1914, the Legion of Honour was conferred upon her. During the World War, although she could no longer walk or stand unaided (an accident having led to the amputation of her leg in 1915) she played at the Front, toured in America (1917) and went to London, where, in 1922, she played a young man's part in Verneuil's *Daniel*. She died in London in March 1923.

She was the author of a prose sketch, *Dans les Nuages* (1878); plays, *Adrienne Lecouvreur*, *Un Coeur d'Homme* (pub. 1911); *L'Aveu* (1888); a novel, *Petite Idole* (1920); Eng. trans. *The Idol of Paris* (1921); *The Art of the Theatre* (trans. 1924).

BIBLIOGRAPHY.—See Jules Huret, *Sarah Bernhardt* (1889); her own autobiography *Ma Double Vie* (1907; Eng. trans. 1908); and the sketch by Sir George Arthur, *Sarah Bernhardt* (1923).

BERNHARDY, GOTTFRIED (1800–1875), German philologist and literary historian, was born of Jewish parents at Landsberg in Brandenburg. In 1825 he became extraordinary professor at Berlin, and in 1829 went to Halle, where he became chief librarian of the university in 1844.

The most important of Bernhardt's works were his histories (or sketches) of Greek and Roman literature: *Grundriss der römischen Literatur* (5th ed. 1872); *Grundriss der griechischen Literatur* (pt. i., Introduction and General View, 1836; pt. ii., Greek Poetry, 1845; pt. iii., Greek Prose Literature, was never published). A fifth edition of pts. i. and ii., by R. Volkmann, began in 1892. Other works by Bernhardt are: *Eratosthenica* (1822); *Wissenschaftliche Syntax der griechischen Sprache* (1829, suppts. 1854, 1862); *Grundlinien zur Encyklopädie der Philologie* (1832); the monumental edition of the Lexicon of Suidas (1834–53); and an edition of F. A. Wolf's *Kleine Schriften* (1869). See Volkmann, *G. Bernhardt* (1887).

BERNI, FRANCESCO (c. 1497–1536), Italian poet, was born at Lamporecchio, in Bibbiena, a district lying along the Upper Arno. In his 19th year he went to Rome, trusting to obtain some assistance from his uncle, the Cardinal Bibbiena, but he was obliged to accept a situation as clerk to Ghiberti, datary to Clement VII. The duties of his office were exceedingly irksome to the poet, but he made himself celebrated at Rome as the most witty and inventive member of a club of literary men, who devoted themselves to light and sparkling effusions. So strong was the admiration for Berni's verses that mocking or burlesque poems have since been called *poesie bernesca*. About the year 1530 he was relieved from his servitude by obtaining a canonry in the cathedral of Florence. In that city he died in 1536, according to tradition poisoned by Duke Alessandro de' Medici for having refused to poison the duke's cousin, Ippolito de' Medici; but considerable obscurity rests over this story. Berni stands at the head of Italian comic or burlesque poets, but perhaps he owes his greatest fame to the recasting (*Rifacimento*) of Boiardo's *Orlando Innamorato*, a task which he completed with such success that general opinion has pronounced decisively in favour of the revision over the original. To each canto he prefixed a few stanzas of reflective verse in the manner of Ariosto, and in one of these introductions he gives us the only certain information we have concerning his own life. The first edition of the *Rifacimento* was printed posthumously in 1541 and a partial translation into English verse was published by W. S. Rose (1823).

BERNICIA, the northern of the two English kingdoms which were eventually united in the kingdom of Northumbria. Its territory is said to have stretched from the Tyne northwards, ultimately reaching the Forth, while its western frontier was gradually extended at the expense of the Welsh. The chief royal residence was Bamburgh, and near it was the island of Lindisfarne, afterwards the see of a bishop. The first king of whom we have any record is Ida, who is said to have obtained the throne about 547. Aethelfrith, king of Bernicia, united Deira to his own kingdom, probably about 605, and the union continued under his successor Edwin, son of Aella, king of Deira. Bernicia was again separated from Deira under Eanfrith, son of Aethelfrith (633–634), after which date the kings of Bernicia were supreme in Northumbria. See Bede, *Hist. Eccles.* ii. 14, iii. 1, 14; Nennius, s. 63; Simeon of Durham, i. 339.

BERNINI, GIOVANNI LORENZO (1598–1680), Italian architect and sculptor, was born at Naples on Dec. 7, 1598, and died there on Nov. 28, 1680. He studied under his father and found a patron in Maffeo Barberini, afterwards Pope Urban VIII, whose palace he designed. He was put in charge of the building operations at St. Peter's, and was made director of improvements in the city. Bernini designed many of the early masterpieces of the baroque style in Rome, and exercised a great influence on contemporary architecture. Louis XIV., when he contemplated the restoration of the Louvre, invited him to submit designs but did not accept them. His most famous achievements are the colonnade of St. Peter's, the façade of the Barberini palace, and the arsenal at Civita Vecchia. His best piece of sculpture is "Apollo and Daphne" in the Borghese Palace. Two works by him in England are a bust of Mr. Baker (?) in the Victoria and Albert Museum, London, and a marble group of Neptune and Glaucus at Brocklesbury Park, Lincs. For the general character of his work as a sculptor see SCULPTURE.

See Stanislas Frascchetti, *Il Bernini* (Milan, 1900).

BERNIS, FRANÇOIS-JOACHIM DE PIERRES DE (1715–1794), French cardinal and statesman, was born at St. Marcel-d'Ardèche on May 22 1715. He was French ambassador in Venice (1751–55), and assisted in the foundation of the league on behalf of Maria Theresa against Frederick the Great of Prussia. He became secretary for foreign affairs on June 27 1757, but owing to his attempts to counteract the spendthrift policy of the marquise de Pompadour (*q.v.*) and her creatures, he fell into disgrace and was in Dec. 1758 banished to Soissons by Louis XV., where he remained in retirement for six years. In the previous November he had been created cardinal by Clement XIII. In 1764, Bernis was recalled, but declined office and was

appointed archbishop of Albi. In 1769 he was present at the conclave which resulted in the election of Clement XIV., and became French ambassador in Rome, where he spent the remainder of his life. He helped to bring about the suppression of the Jesuits and acted with greater moderation than is generally allowed. He lost his influence under Pius VI, who was friendly to the Jesuits, and the French Revolution, to which he was hostile, reduced him almost to penury; the court of Spain, however, came to his relief with a handsome pension. He died at Rome on Nov. 3, 1794. His *Mémoires et lettres 1715–58* (1878) are still interesting to the historian.

See Frédéric Masson's prefaces to the *Mémoires et lettres*, and *Le Cardinal de Bernis depuis son ministère* (1884), E. et J. de Goncourt, *Mme de Pompadour* (1888), and Sainte-Beuve, *Causeries*, v. viii.

BERNOULLI or **BERNOULLI**, the name of a Swiss family of scientists and mathematicians who made their home in Basle.

(1) **JACQUES BERNOULLI** (1654–1705), mathematician, after concluding his studies at the University of Basle, travelled in England, France and Holland. He constructed his *Universal Tables on Dialling* at Bordeaux and returned in 1682 to Basle, where he opened a public seminary for experimental physics. In 1687 he became professor of mathematics in the university and later its rector. Jacques Bernoulli was the first to solve Leibnitz's problem of the isochronous curve. He proposed the problem of the catenary (*q.v.*) or curve formed by a chain suspended by its two extremities, accepted Leibnitz's construction of the curve and solved more complicated problems relating to it. He determined the "elastic curve," which is formed by an elastic plate or rod fixed at one end and bent by a weight applied to the other, and which he showed to be the same as the curvature of an impervious sail filled with a liquid. In 1696 he offered a reward for the solution of the problem of isoperimetrical figures, which led to a quarrel with his brother Jean whose solution he declined.

Jacques Bernoulli's mathematical works are: *Ars Conjectandi; opus posthumum: accedunt tractatus de Seriebus Infinitis, et epistola (Gallice scripta) de Ludo Pilae Reticularis* (Basiliae, 1713); *Jacobi Bernoulli Basiliensis Opera* (Genevae, 1744).

(2) **JEAN BERNOULLI** (1667–1748), studied under his brother Jacques at Basle and then worked under the marquis de l'Hôpital in Paris. He spent ten years as professor of mathematics at Groningen, and in 1705 succeeded his brother Jacques in the chair of mathematics at the university of Basle. Like his brother he was a great mathematician. Among his independent discoveries were the exponential calculus, and the line of swiftest descent, which he was the first to determine, pointing out at the same time the relation which this curve bears to the path described by a ray of light passing through strata of variable density.

Jean Bernoulli's writings were collected and published under the title of *Johannis Bernoulli Operi Omnia* (Lausan. et Genev.); his correspondence with Leibnitz appeared under the title of *Gul. Leibnitii et Johannis Bernoulli commercium Philosophicum et Mathematicum* (Lausan. et Genev., 1745).

(3) **NICOLAS BERNOULLI** (1695–1726), eldest son of the preceding, was for three years professor of jurisprudence of Berne. He and his brother Daniel were appointed professors of mathematics in the Academy of St. Petersburg, but within eight months of the appointment Nicolas died. Some of his mathematical papers are published in his father's works.

(4) **DANIEL BERNOULLI** (1700–1782), younger brother of the preceding, spent seven or eight years at St. Petersburg as professor of mathematics and then returned to Basle, where in 1733 he became professor of anatomy and botany and afterwards of experimental and speculative philosophy. His most important work is his *Hydrodynamica* (1738), in which the equilibrium, the pressure, the reaction and varied velocities of fluids are considered both theoretically and practically. One of these problems deals with an ingenious mode of propelling vessels by the reaction of water ejected from the stern. Daniel Bernoulli gained or shared no less than ten prizes of the Academy of Sciences of Paris. The first, for a memoir on the construction of a clepsydra for measuring time exactly at sea, he gained at the age of 24; the second, for

one on the physical cause of the inclination of the planetary orbits, he divided with his father; and the third, for a communication on the tides, he shared with Euler, Colin Maclaurin and another competitor. The problem of vibrating cords, which had been some time before resolved by Brook Taylor (1685-1731) and d'Alembert, became the subject of a discussion between Bernoulli and his friend Euler. In one of his early investigations he gave a demonstration of the problem of the parallelogram of forces. His labours in the decline of life were chiefly directed to the doctrine of probabilities in reference to practical purposes, and in particular to economic subjects.

Several of Daniel Bernoulli's investigations are contained in the earlier volumes of the *Comment. Acad. Petropol.*; and his separately published works are:—*Dissertatio Inaugur. Phys. Med. de Respiratione* (Basil, 1721); *Positiones Anatomico-Botanicæ* (Basil, 1721); *Exercitationes quædam Mathematicæ* (Venetiis, 1724); *Hydrodynamica* (Argentorati, 1738).

BERNOULLI NUMBERS or **BERNOULLIAN NUMBERS**, a series of fractions beginning with $\frac{1}{2}, \frac{1}{6}, \frac{1}{4}, \frac{1}{30}, \frac{1}{42}, \frac{1}{30}, \frac{1}{42}, \dots$, and designated respectively by the symbols $B_1, B_2, B_3, \dots, B_n$. The name was given to them by Abraham De Moivre (q.v.) and Leonard Euler (q.v.) in honour of their discoverer, Jacques Bernoulli (1654-1705), who introduced them into analysis in his posthumous work, *Ars Conjectandi* (Basle, 1713). He used them in summing the n th powers of the first x integers, his formula being:—

$$S_n = 1 + 2^n + 3^n + \dots + x^n = \frac{x^{n+1}}{n+1} + \frac{x^n}{2} - \frac{n}{2} B_1 x^{n-1} + \frac{n(n-1)}{2 \cdot 3 \cdot 4} B_2 x^{n-3} - \dots$$

For upwards of two centuries these numbers have been the object of study of some of the best mathematical minds. It has been shown that they have numerous important applications, particularly in the theory of numbers, the calculus of differences, and the theory of definite integrals. They are also intimately connected with the theory of tangential coefficients, and with such important families of numbers as Euler's (see EULER NUMBERS) and Stirling's (see STIRLING NUMBERS) of the first and second methods of calculation. Bernoulli himself gave only five of these numbers, but since his time, Euler has given 15; Ohm, 31; Adams, 62; and Serebrennikow, 90.

The first of the recurring formulae for the numbers was given by De Moivre in his *Miscellanea Analytica, Complementum*, (1730), as follows:—

$$(2m+1)B_m - (2m+1)_3 B_{m-1} + (2m+1)_5 B_{m-2} + \dots \pm (-1)^{m-1} (2m+1)_{2m-1} B_1 + (-1)^m (m-\frac{1}{2}) = 0.$$

This is based on a rule given by Bernoulli. Jacobi (1834) gave the following:—

$$(2m+2)_2 B_m - (2m+2)_4 B_{m-1} + (2m+2)_6 B_{m-2} + \dots + (-1)^{m-1} (2m+2)_{2m} B_1 + (-1)^m m = 0.$$

Many other recurring formulae have been developed, but they are all subject to one great disadvantage—that the calculation of any special Bernoulli number, say the n th, requires a knowledge of all the previous $n-1$ numbers. Since 1887, however, various reversion formulae have been developed—notably by Seidel, Stern, and Saalschütz—in which some of the preceding numbers were missing. In particular, Haussner developed a set of formulae in which none appeared except those with the indices $nq+v$.

Formulae for these numbers have been given in determinant notation. For example, Glaisher gave the following:—

$$B_m = m! \begin{vmatrix} \frac{1}{2!} & 1 & 0 & \dots & 0 \\ \frac{1}{3!} & \frac{1}{2!} & 1 & \dots & 0 \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ \frac{1}{m+1!} & \frac{1}{m!} & \frac{1}{m-1!} & \dots & \frac{1}{2!} \end{vmatrix}$$

Haussner suggested the form

$$B_m = \frac{m}{2^m(2^m-1)} \begin{vmatrix} 1 & 0 & \dots & 0 & 1 \\ 3! & 1 & \dots & 0 & 1 \\ 5! & 3! & \dots & 0 & 1 \\ \cdot & \cdot & \cdot & \cdot & \cdot \\ (2m-3)! & (2m-5)! & \dots & 1 & 1 \end{vmatrix}$$

One of the most interesting discoveries made by Euler in this connection is that the Bernoulli numbers occur also in the sum of the even powers of the reciprocals of the natural numbers; i.e.,

$$S_{2m} = \frac{1}{1} + \frac{1}{2^{2m}} + \frac{1}{3^{2m}} + \dots = \frac{2^{2m-1}\pi^{2m}}{2m!} B_m, \text{ which gives the for-}$$

$$\text{mula } B_m = \frac{S_{2m} \cdot 2m!}{2^{2m-1} \pi^{2m}}. \text{ They also occur as coefficients in the ex-}$$

$$\text{pansion of both } \frac{x \cdot e^x + 1}{2 \cdot e^x - 1} \text{ and } \frac{x}{e^x - 1}.$$

Of the many properties of these numbers that have been discovered by various investigators, one of the most interesting is Von Staudt's or Clausen's theorem, as it is called from its simultaneous discoverers. It states that, if $\alpha, \beta, \gamma, \dots$ are all the prime numbers greater by 1 than the divisors of $2m$, then

$$B_m + (-1)^{m+1} \left[\frac{1}{2} + \frac{1}{\alpha} + \frac{1}{\beta} + \frac{1}{\gamma} + \dots + \frac{1}{\lambda} \right] \text{ is an integer.}$$

From this it is apparent that the denominator of any of the numbers can be found. For example, to find the denominator of B_{11} , observe that the divisors of 22 are 1, 2, 11, 22. Increasing each by 1, we have 2, 3, 12, 23 of which only 2, 3, and 23 are prime. Hence the denominator is 2, 3, 23, or 138, and the fractional part of B_{11} is $\frac{1}{2} + \frac{1}{3} + \frac{1}{23}$ or $\frac{121}{138}$. Later investigators have found recurring formulae for the integral parts of the numbers, the most important ones being due to Hermite, Stern, and Lipschitz. The third of these writers gave the most general one.

Besides the relation of these numbers to certain other families already mentioned, Frobenius considered one that is so fundamental that he used it for a new definition of the numbers themselves. It states that when the Stirling number of the second kind, of order n , is expressed as a polynomial in x (see STIRLING NUMBERS), the value of the polynomial for $x = -1$ is equal to

$$B_n, \text{ and the value of its derivative for } x=0 \text{ is } \frac{1}{n} (-1)^n B_n.$$

Many generalizations of these numbers have been made, a discussion of the subject by Prof. E. T. Bell appearing in the *American Journal of Mathematics* (1925). These generalizations vary according to the branches to which the numbers are applicable, many owing their appearance to the function used to define the numbers themselves. For example, if the numbers are defined as the value of a certain polynomial $T_n(x)$ for $x = -1$, then the values of T for $x = -2, -3, \dots$; i.e., $T(-2), T(-3), \dots$, will lead to what are known as ultra-Bernoulli numbers or generalized Bernoulli numbers, a term that will probably persist.

Glaisher, numerous articles in the *Messenger of Mathematics*, the *Quarterly Journal of Pure and Applied Mathematics*.

BERNSTEIN, AARON (1812-1884), Jewish scientist, author and reformer, a native of Dantzic. Bernstein took an active share in the movement for synagogue reform in Germany. He was the author of two delightful Ghetto stories, *Vögele der Maggid* and *Mendel Gibbor*, being one of the originators of this genre of modern fiction. He also wrote *History of Revolution and Reaction in Germany* (3 vols., 1883-1884) a collection of important political essays. He died on Feb. 12, 1884, in Berlin.

BERNSTEIN, EDUARD (1850–), German politician and writer, was born in Berlin, Jan. 6, 1850. In 1872 he joined the Social Democrats and from 1881–90 edited, with Bebel, the *Sozialdemokrat* in Zürich, and later in London, where he lived in exile until 1901. In 1902 he entered the Reichstag as deputy for Breslau. He was best known as the author of "Revisionism," a changed conception of Marxism, based on the belief that the class struggle was diminishing in intensity. This he argued from figures which appeared to show that the number of small fortunes, and consequently of the middle-class, was on the increase. He was therefore regarded as the chief right wing Socialist leader, but when the split in the party occurred in March 1916, his pacifist convictions forced him to associate with the Independents. He rejoined the Majority Socialists, however, in 1919. Bernstein's works include: *Die Voraussetzungen des Sozialismus und die Aufgaben der Sozialdemokratie* (first pub. 1899, latest ed., 1920); *Zur Geschichte und Theorie des Sozialismus* (1901, 1904); *Sozialismus und Demokratie in den grossen Englischen Revolution* (1922); *Erinnerungen eines Sozialisten* (1918); *Die deutsche Revolution, ihre Entstehung, ihr Verlauf und ihr Werk* (1921).

BERNSTEIN, HENRY (1876–), French dramatist, was born in Paris on June 20, 1876. His early plays, *Le Marché* (1900) and *Le Détour* (1902) in particular, owe something to the school of the *Théâtre Libre*; it was only in *La Rafale* (1906) that what may be called his first distinctive manner emerged. The plays which belong to this period depend entirely for their effect on action and situation and have no literary appeal; they do not present any spiritual conflict, but an opposition of human wills and forces which the spectator follows with the breathless interest he would give to an exciting contest. These characteristics may be noted in *Le Voleur* (1907), and still more in *Israël* (1908) and *Samson* (1910). At this time Bernstein found an admirable interpreter of his plays in Lucien Guitry. *L'Assaut* (1912) and *Le Secret* (1913) (one of his best plays) show evidence of a desire to create less rudimentary characters and devote more attention to their presentation and analysis of their motives. *Le Secret* is thus akin to the plays which he wrote in the post-war period, following on his strange *Judith* (1922), *La Galerie des Glaces* (1925), *Félix* (1926), and above all *Le Venn* (1927). Adopting the technique of a younger generation he endeavours to express its mental unrest and thus contributes to the *théâtre de l'inquiétude* which was the creation of a later school of dramatic authors. These later plays of Bernstein are a remarkable proof of the dramatist's ability to adapt himself to the fashion and spirit of the age, but he will probably be remembered best for the plays of his first manner, which were a more genuine expression of his genius, and excellent of their kind.

BERNSTORFF, ANDREAS PETER, COUNT VON (1735–1797), Danish statesman, was born in Hanover on Aug. 28 1735. His career was determined by his uncle, Johann Hartwig Ernst Bernstorff, who sent his nephew to study in the German and Swiss universities and travel for some years in Italy, France, England, and Holland, to prepare himself for a statesman's career. In 1758 he entered the Danish foreign office, was created count in 1767, and was dismissed with his uncle in 1770. He re-entered the service after Struensee's fall at the end of 1772, working at first in the finance and economic departments, and also taking an especial interest in agriculture. The improvements he introduced in the tenures of his peasantry anticipated in some respects the agricultural reforms of the next generation.

In April 1773 Bernstorff was transferred to the ministry of foreign affairs, where his first official act was to conclude the negotiations which had long been pending with the grand-duke Paul as duke of Holstien-Gottorp. The result was the exchange-treaty of June 1 (May 21, O.S.), 1773, confirming the previous treaty of 1767 (see **BERNSTORFF, J. H. E.**). This was followed by the treaty of alliance between Denmark and Russia of Aug. 12, 1773, which was partly a mutually defensive league and partly an engagement between the two states to upset the new constitution recently established in Sweden by Gustavus III, when the right moment for doing so should arrive. Though the preliminaries

of this treaty had been definitely settled in his uncle's time, there can be no doubt that he regarded this anti-Swedish policy as the correct one for Denmark. It is also pretty certain that the anti-Swedish alliance was Russia's price for compounding the Gottorp difficulty.

Starting from the hypothesis that Sweden was "Denmark-Norway's most active and irreconcilable enemy," Bernstorff logically included France, the secular ally of Sweden, among the hostile powers with whom an alliance was to be avoided, and drew near to Great Britain as the natural foe of France, especially during the American War of Independence, and this, too, despite the irritation occasioned in Denmark-Norway by Great Britain's masterful interpretation of the expression "contraband." Bernstorff was much inclined, the same winter, to join a triple alliance between Great Britain, Russia, and Denmark-Norway, proposed by England for the purpose of compelling the Bourbon powers to accept reasonable terms of peace. But he was overruled by the crown prince Frederick, who thought such a policy was hazardous, and the Russian chancellor Nikita Panin proposed an armed league, to embrace all the neutral powers, for the purpose of protecting neutral shipping in time of war. This league was very similar to one proposed by Bernstorff himself in Sept. 1778 for enforcing the principle "a free ship makes the cargo free"; but as now presented by Russia he rightly regarded it as directed exclusively against England. He acceded to it unwillingly (July 9 1780); but he had previously, by a separate treaty with England, on July 4, come to an understanding with that power as to the meaning of the expression "contraband of war." Bernstorff was ultimately sacrificed to the resentment of the Russian government (Nov. 13 1780). He retired to his Mecklenburg estates but, on the fall of Guldberg four years later, was recalled to office (April 1784). The new government held the mean between Struensee's extravagant cosmopolitanism and Guldberg's stiff conservatism. In the emancipation of the serfs Bernstorff took a leading part.

Meanwhile, as Bernstorff had predicted, the Russian neutrality project had resulted in a breach between Great Britain and Russia. Then came Gustavus III's sudden war with Russia in 1788. Bernstorff took care that the assistance rendered to Russia under treaty obligations should be as trifling as possible, to avoid offending Great Britain and Prussia. On the outbreak of the French Revolution, Bernstorff condemned on principle any interference in the domestic affairs of France, and he was persuaded that Denmark's safest policy was to keep clear of every anti-French coalition. His neutrality treaty with Sweden (March 17 1794), for protecting their merchantmen by combined squadrons, was extremely beneficial to the Scandinavian powers, both commercially and politically. Taught by the lesson of Poland, he had, in fact, long since abandoned his former policy of weakening Sweden. Bernstorff's great faculties appeared, indeed, to mature and increase with age, and his death on June 21 1797, was regarded in Denmark as a national calamity.

See Christian Ulrich Detlev von Eggers, *Denkwürdigkeiten aus dem Leben des Grafen A. P. Bernstorff* (1800); Aage Friis, *A. P. Bernstorff og O. Hoegh-Guldberg* (1899); and *Bernstorfferne og Danmark* (1903).

BERNSTORFF, CHRISTIAN GÜNTHER, COUNT VON (1760–1835), Danish and Prussian statesman and diplomatist, son of Count Andreas Peter von Bernstorff, was born at Copenhagen on April 3, 1769. He began his career in 1787, as attaché to the representative of Denmark at the opening of the Swedish diet. In 1789 he went as secretary of legation to Berlin, where his maternal uncle, Count Leopold Friedrich zu Stolberg, was Danish ambassador; he was soon chargé d'affaires, and in 1791 minister plenipotentiary. He was ambassador at Stockholm from 1794 until May 1797, when he was summoned to Copenhagen to act as substitute for his sick father, on whose death (June 21) he succeeded as secretary of state for foreign affairs and privy councillor. In 1800 he became head of the ministry. He remained responsible for the foreign policy of Denmark until May 1810, a fateful period which saw the battle of Copenhagen (April 2, 1801), the bombardment of Copenhagen and capture of the Danish fleet in 1807. After his retirement he remained without office until his

appointment in 1811 as Danish ambassador at Vienna. He remained here, in spite of the fact that for a while Denmark was nominally at war with Austria, until, in January 1814, on the accession of Denmark to the coalition against Napoleon, he publicly resumed his functions as ambassador. He accompanied the emperor Francis to Paris, and was present at the signature of the first peace of Paris. With his brother Joachim, he represented Denmark at the congress of Vienna and, as a member for the commission for the regulation of the affairs of Germany, was responsible for some of that confusion of Danish and German interests which was to bear bitter fruit later in the Schleswig-Holstein question. He again accompanied the allied sovereigns to Paris in 1815, returning to Copenhagen the same year. In 1817 he was appointed Danish ambassador at Berlin, his brother Joachim going at the same time to Vienna. In the following year Prince Hardenberg made him the formal proposition that he should transfer his services to Prussia, which, with the consent of his sovereign, he did.

It was, therefore, as a Prussian diplomat that Bernstorff attended the congress at Aix-la-Chapelle (Oct. 1818), at the close of which he returned to Berlin as minister of state and head of the department of foreign affairs. Bernstorff was by training and temperament opposed to the Revolution, and he was initiated into his new duties as a Prussian minister by the reactionary Ancillon. He is accused of having subordinated the particular interests of Prussia to the European policy of Metternich and the "Holy Alliance." It is true that Bernstorff supported the Carlsbad decrees, and the Vienna Final Act; he was also the faithful henchman of Metternich at the congresses of Laibach, Troppau and Verona. On the other hand, he took a considerable share in laying the foundations of the customs union (*Zollverein*), which was destined to be the foundation of the Prussian hegemony in Germany. In his support of Russia's action against Turkey in 1828 also he showed that he was no blind follower of Metternich's views. In the crisis of 1830 his moderation in face of the warlike clamour of the military party at Berlin did much to prevent the troubles in Belgium and Poland from ending in a universal European conflagration. In the spring of 1832 the state of his health compelled him to resign the ministry of foreign affairs to Ancillon. He died on March 28, 1835.

See J. Caro in *Allgem. Deutsch. Biog. s.v.*; H. von Treitschke, *Deutsche Geschichte* (Leipzig, 1874-94); C. Ringhofer, *Ein Dezennium preussischer Orientpolitik . . . 1821-30* (1897).

BERNSTORFF, JOHANN HARTWIG ERNST, COUNT VON (1712-1772), Danish statesman, who came of a very ancient Mecklenburg family, was the son of Joachim Engelke, Freiherr von Bernstorff, chamberlain to the elector of Hanover, and was born on May 13, 1712. His maternal grandfather, Andreas Gottlieb Bernstorff (1640-1726), had been one of the ablest ministers of George I. He was introduced into the Danish service by his relations, the brothers Plessen, who were ministers of state under Christian VI. From 1744 to 1750 he was ambassador in Paris. Shortly after his return from Paris he became (1751) foreign minister. He occupied for twenty-one years the highest position in the government, and in the council of state his opinion was decisive. But his chief concern was ever with foreign affairs. A friendly alliance with a relatively weak Sweden was the cardinal point of Bernstorff's policy. But his plans were traversed again and again by unforeseen complications, the failure of the most promising presumptions, the perpetual shifting of apparently stable alliances. During the Seven Years' War he succeeded in preserving the neutrality of Denmark, despite the existence of a subsidy-treaty with the king of Prussia, and the suspicions of England and Sweden. It was through his initiative, too, that the convention of Kloster-Seven was signed (Sept. 10, 1757), and on May 4, 1758, he concluded a treaty with France, whereby, in consideration of Denmark's holding an army-corps of 24,000 men in Holstein till the end of the war, to secure Hamburg, Lübeck and the Gottorp part of Holstein from invasion, France, and ultimately Austria also, engaged to bring about an exchange between the king of Denmark and the cesarevitch as regards Holstein. But the course of the war made this compact inoperative. Austria

hastened to repudiate her guarantee to Denmark in order not to offend the new emperor of Russia, Peter III., and one of Peter's first acts on ascending the throne was to declare war against Denmark. The coolness and firmness of Bernstorff saved the situation. He placed the best French general of the day at the head of the well-equipped Danish army. But at this juncture Peter III. was overthrown. Bernstorff recognized the impotence of the French monarchy after the Seven Years' War, and in 1763 exchanged the French for the Russian alliance, which was cemented by the treaty of April 28, 1765, under which Catherine II. undertook to cede the Gottorp portion of Holstein in exchange for the counties of Oldenburg and Delmenhorst. For his part in this treaty Bernstorff was created count. On the accession of Christian VII., in 1766, Bernstorff's position became very precarious. Though Bernstorff ruled Denmark for twenty years, he never learnt Danish. His last act was a further *rapprochement* with Russia by the treaty of Dec. 13, 1769, which stipulated that any change in the Swedish constitution should be regarded by Denmark and Russia as a *casus belli* against Sweden, and that in the event of such a war Denmark should retain all the territory conquered from Sweden. This treaty proved to be a great mistake on Denmark's part. Nine months later, on Sept. 13, 1770, Bernstorff was dismissed as the result of Struensee's intrigues, and retired to his German estates, where he died on Feb. 18, 1772. Bernstorff was not only one of the ablest but one of the noblest and most conscientious statesmen of his day. The motto he chose on receiving the order of the Daneborg was "*Integritas et rectum custodiunt me*" (Integrity and right guard me), and throughout a long life he kept to it.

See Poul Vedel, *Den aeldre Grev Bernstorffs ministerium* (1882); *Correspondance ministérielle du Comte J. H. E. Bernstorff*, ed. Vedel (1882); Aage Friis, *Bernstorfferne og Danmark* (1899).

BERNSTORFF, JOHANN HEINRICH, COUNT VON (1862-), German diplomatist, was born in London Nov. 14 1862, the son of the Prussian diplomatist, Count Albrecht von Bernstorff, who was Prussian minister and German ambassador in London, 1854-61 and 1862-73. He entered the diplomatic service in 1899, was secretary of legation successively at Belgrade, Dresden, St. Petersburg and Munich, and (1902-06) councillor of the embassy in London. He then went as consul-general to Cairo, whence he proceeded as German ambassador in 1908 to Washington, and remained there until America's declaration of war against Germany in April 1917. He made great efforts to facilitate mediation by President Wilson, but he did not receive the support he expected from authoritative quarters in Berlin. On the American declaration of war he returned to Germany and was sent as ambassador to Constantinople, where he was employed until 1918.

In various publications, and in his reminiscences on his term of office as ambassador in Washington, he endeavoured to prove that Germany, if she had followed the proper policy, could have avoided war with America. This statement of his views excited much controversy in his own country. When the revolution broke out in 1918 Bernstorff left the diplomatic service, but later took an active part in parliamentary politics as a member of the Democratic Party in the *reichstag*, and also maintained a close connection with the international press, and with pacific post-war propaganda, especially with League of Nations matters and as chairman of the German League of Nations Union.

See his *Deutschland und Amerika: Erinnerungen aus dem fünfjährigen Kriege* (1920).

BEROEIA: see ALEPPO.

BEROSSUS, a priest of Bel at Babylon, who translated into Greek the standard Babylonian work on astrology and astronomy, and compiled (in three books) the history of his country from native documents, which he published in Greek in the reign of Antiochus II. (250 B.C.). His works have perished, but extracts from the history have been preserved by Josephus and Eusebius. Eusebius probably derived them not directly from Berossus, but through the medium of Alexander Polyhistor and Apollodorus. The extracts containing the Babylonian cosmology, the list of the antediluvian kings of Babylonia, and the Chaldaean story of the Deluge have been shown by the decipherment of the cuneiform texts to have faithfully reproduced the native legends.

All attempts to harmonize the scheme of dynasties thus ascribed to Berossus with the list given us in the so-called dynastic tablets discovered by Dr. Pinches have been failures. All that seems certain is that Berossus arranged his history so that it should fill the astronomical period of 36,000 years, beginning with the first man and ending with the conquest of Babylon by Alexander the Great.

Pinches in *P.S.B.A.*, 1880-81.

BEROUN, a town of Bohemia, Czechoslovakia, situated in a widening of the Beroun valley 27m. south-west of Prague. The fertility of the basin in which it lies and the location on one of the important approaches to Prague contributed to its early development, especially during the period of patronage by Charles IV., but the same factors caused it to be frequently sacked and devastated. The modern prosperity is based upon industrial activities handling local produce, notably sugar-refining, flour-milling, brewing and the manufacture of textiles; it shares, also, in the iron, cement and lime manufactures of the Beroun valley. Pop. 11,448.

BERRY, CHARLES FERDINAND, DUKE OF (1778-1820), younger son of Charles X. of France, left France during the Revolution, with his father, then comte d'Artois, and served in the army of Condé from 1792 to 1797. He afterwards joined the Russian army, and in 1801 took up his residence in England, where he remained for 13 years. During that time he married an Englishwoman, Anna Brown, by whom he had two daughters, afterwards the baronne de Charette and the comtesse de Lucinge-Faucigny. The marriage was cancelled for political reasons in 1814, when the duke set out for France. His frank, open manner gained him some favour with his countrymen, and Louis XVIII. named him commander in chief of the army at Paris on the return of Napoleon from Elba. He retired to Ghent during the Hundred Days. In 1816 he married the princess Caroline Ferdinande Louise (1798-1870), eldest daughter of King Francis I. of Naples. On Feb. 13, 1820, he was mortally wounded, when leaving the opera-house at Paris with his wife, by a saddler named Louis Pierre Louvel. Seven months after his death the duchess gave birth to a son, who received the title of duke of Bordeaux, but who is known in history as the comte de Chambord. A daughter, afterwards duchess of Parma, was born in 1819.

CAROLINE LOUISE duchess of Berry was compelled to follow Charles X. to Holyrood after July 1830, but it was with the resolution of returning speedily and making an attempt to secure the throne for her son. From England she went to Italy, and in April 1832 she landed near Marseilles, but, receiving no support, made her way towards the loyal districts of Vendée and Brittany. Her followers, however, were defeated, and after remaining concealed for five months in a house in Nantes she was betrayed to the government and imprisoned in the castle of Blaye. Here she gave birth to a daughter, the fruit of a secret marriage contracted with an Italian nobleman, Count Ettore Lucchesi-Palli (1805-64). The announcement of this marriage at once deprived the duchess of the sympathies of her supporters. She was no longer an object of fear to the French government, who released her in June 1833. She set sail for Sicily, and, joining her husband, lived in retirement from that time till her death, at Brunnensee, in Switzerland, on April 16, 1870.

See Chateaubriand, *Mémoires touchant la vie et la mort du duc de Berry* (1820); Imbert de Saint-Amand, *La duchesse de Berry* (1888-91).

For the duchess see H. N. Williams, *A Princess of Adventure* (1911); G. Poinso, *La Vie Romanesque de la duchesse de Berry* (1913); E. Dejean, *La Duchesse de Berry et les monarchies européennes, août 1830—décembre 1833* (1913); J. Dubreton, *La Princesse captive. La duchesse de Berry, 1832-1833* (with portrait, 1925).

BERRY, JOHN, DUKE OF (1340-1416), third son of John II., king of France and Bonne of Luxemburg, was born on Nov. 30, 1340, at Vincennes. He was created count of Poitiers in 1356, and was made the king's lieutenant in southern France, though the real power rested chiefly with John of Armagnac, whose daughter Jeanne he married in 1360. The loss of his southern possessions

by the treaty of Bretigny was compensated by the fiefs of Auvergne and Berry, with the rank of peer of France. The duke went to England in 1360 as a hostage for the fulfilment of the treaty of Bretigny, returning to France in 1367 on the pretext of collecting his ransom. On his return he received the province of Languedoc. The peasant revolt of the *Tuchins* and *Coquins*, as the insurgents were called, was suppressed with great harshness, and the duke exacted from the states of Languedoc assembled at Lyons a fine of £15,000. He fought at Rosebeke in 1382 against the Flemings and helped to suppress the Parisian revolts. The repression in 1383 was followed by a series of heavy fines on the chief cities of France, and, says Froissart, "the whole went into the pockets of the duke of Berry and the duke of Burgundy, for the young king was under their governance." By a series of delays Berry caused the failure of the naval expedition prepared at Sluys against England in 1386, and a second accusation of military negligence led to the disgrace of the royal princes and the temporary triumph of the *marmousets*, as the advisers of the late king were nicknamed. Charles VI. visited Languedoc in 1389-90, and enquired into his uncle's government. The duke was deprived of the government of Languedoc, and his agent, Bétizac, was burnt. When in 1401 he was restored, he delegated his authority in the province, where he was still hated, to Bernard d'Armagnac. In 1396 he negotiated a truce with Richard II. of England, and his marriage with the princess Isabella of France. He tried to mediate between his brother Philip the Bold of Burgundy and his nephew Louis, duke of Orleans, and later between John "sans Peur" of Burgundy and Orleans. He broke with John after the murder of Orleans, though he tried to prevent civil war, and only finally joined the Armagnac party in 1410. In 1413 he resumed his rôle of mediator, and was for a short time tutor to the dauphin. He died in Paris on June 15, 1416, leaving vast treasures of jewellery, objects of art, and especially of illuminated mss., many of which have been preserved. He decorated the Sainte Chapelle at Bourges; he built the Hôtel de Nesle in Paris, and palaces at Poitiers, Bourges, Mehun-sur-Yèvre and elsewhere.

See also L. Raynal, *Histoire du Berry* (Bourges, 1845); "Jean, duc de Berry," in S. Luce, *La France pendant la guerre de Cent Ans* (1890), vol. i.; Toulgoet-Tréanna, in *Mém. de la Soc. des antiquaires du centre*, vol. xvii., 1890. His beautiful illuminated *Livre d'heures* was reproduced (Paris, fol. 1904) by P. Durrieu.

BERRY, the name of a family which acquired large industrial interests in South Wales and important properties in the newspaper and publishing business. There were three brothers, sons of Alderman J. M. Berry of Merthyr Tydvil, Henry Seymour 1st Lord Buckland (1877-1928), William Ewert (b. 1879), created baronet in 1921 and James Gomer (b. 1883) created baronet in 1928. Lord Buckland, who was chairman of Guest, Keen and Nettlefolds, and a generous benefactor of his native town, Merthyr Tydvil, was killed in a riding accident in 1928. Sir William Berry, who received a baronetcy in 1921, devoted his energies mainly to newspaper work. He founded the *Advertising World* in 1901, and became a working journalist, contributing largely to the newspaper which he directed. After he became connected with the *Sunday Times*, of which he was editor-in-chief from 1915 onwards, he acquired, either alone or with his brother, Gomer Berry, other important newspaper and publishing interests. The brothers acquired a controlling interest in the *Financial Times*, *The Graphic*, Cassell's publishing firm, Kelly's Directories, and groups of newspapers and periodicals, including the Hulton interests and the Amalgamated Press; in 1927 they acquired the *Daily Telegraph*. In 1928 there was keen rivalry between the Berrys, on behalf of Allied Newspapers Ltd., and Allied Northern Newspapers Ltd., and Lord Rothermere, on behalf of the *Daily Mail* group for the control of the provincial press in various centres.

BERRY, CHARLES ALBERT (1852-1899), English nonconformist divine, was born at Bradshawgate, Leigh, Lancashire. In 1875 he became pastor of St. George's Road Congregational church, Bolton, and in 1883 pastor of the church at Queen street, Wolverhampton, with the supervision of nine dependent churches in the neighbourhood. In 1887 he went to America, and was invited to succeed Beecher in what was then the best-known

pulpit in the United States. Berry, however, felt that his work lay in England and declined the invitation. In 1892 he took part in a conference at Grindelwald on the question of Christian reunion, and subsequently, with Hugh Price Hughes and Alexander Mac-kennal of Bowdon, conducted a campaign throughout England, introducing the ideas and principles of Free Church federation. He was the first president of the Free Church Congress. He played an effective part in expressing the popular desire for peace between England and America in reply to President Cleveland's message on the Venezuelan boundary dispute. In 1896 he was elected chairman of the Congregational Union of England and Wales.

BERRY, EDWARD WILBER (1875-), American palaeontologist, was born in Newark, N.J., on Feb. 10, 1875. He was educated privately and from 1897 until 1905 he conducted a newspaper in Passaic, N.J. In 1905 he studied at the Johns Hopkins university where in 1906 he was appointed assistant in palaeontology and in 1917 was made the first professor of palaeontology in that institution. In 1910 he became geologist in the United States geological survey. He made geological history and the geological distribution of the angiosperms his chief fields of research in connection with which he conducted extensive investigations in the Andean region.

Among his publications are *Lower Cretaceous of Maryland* (1911); *Upper Cretaceous of Maryland* (1916); *Eocene Floras of Southeastern North America* (1916); *Tree Ancestors* (Baltimore, 1923); *The Middle and Upper Eocene Floras of Southeastern North America* (Washington, 1924); *A Late Tertiary Flora from Bahia, Brazil* (with Arthur Hollick, Baltimore, 1924); *The Flora of the Repley Formation* (Washington, 1925); *Contributions to the Geology and Palaeontology of South America* (with Frank M. Swartz, Baltimore, 1925) and *Fossil Leaves from Beaver County* (Norman, Okla., 1926).
